## TO OUR READERS.

— x —

A DIGNITARY of the Church has written to us a letter, from which we venture to make this extract—"The Journal is the greatest source of amusement to me. When wearied with other work, or unwell, or cross, to sit down for a half-hour and ponder my old numbers—they soothe, delight, amuse, and are inexpressibly dear to me. An old clergyman regarded me, I believe, as a kind of maniac the other day; and when I asked him if he did not love flowers he answered bluntly, 'Flowers have no soul! flowers have no soul!' Poor man! what a dreary wilderness must this lovely world be to him!" Yes, a man so minded is to be pitied; but we have no doubt he is devoted—gloomily devoted—to his clerical duties, and he might be advantaged by considering the words which came from the lips of a Bishop—"Was He mistaken Who said 'Consider the Lilies;' and Who in His hour of severest trial retired to a garden?"

The pages of our Journal, writes our kindly correspondent, "soothe, delight, amuse, and are inexpressibly dear to me;" and we say in our own names, and in the names of our contributors, that that is a most gratifying testimonial. We also know that as a medium for obtaining information, which not only every amateur but every practical gardener sometimes needs, our pages are made available; and we add, without the slightest feeling of self-approbation, that they are deservedly so referred to, for we always obtain the information required from those known to be best qualified to impart it.

With thanks to you all for the high position to which you have raised and retain us, we remain, and hope to remain,

Your Servants,

THE EDITORS.

## INDEX.

- ABERDEEN POULTRY SHOW**, 60, 59.  
*Acaia*, armata culture, 3; 1; and Freemasons, 76; for conservatory wall, 85.  
**Aceington Poultry Show**, 433.  
*Achimenes* culture, 224, 281.  
*Aeonium heterophyllum*, 297.  
*Aeronaeta Acriis*, 119.  
*Adiantum farleyense*, 236.  
*Aethionema marmorata*, 151.  
 Agertum, white from seed, 553; Imperial Blue Tom Thumb, 326, 311.  
**Agricultural returns** (1873), 122.  
**Air-giving**, 251.  
 Alcove, plants for, 216.  
 Alexandra Palace and Park, 444.  
 Almandas and their culture, 313.  
 Alcea-culture, 116.  
 Aloe in summer, 496.  
 Alpine plants, for spring bedding, 31; for winter bedding, 6.  
*Alstromeria chilensis* and culture, 277.  
 Alstrutheria, amena sowing, 298;  
 in the north, 434, 441.  
*Amaryllis* from seed, 190.  
 American blight, 32, 129, 431; destroying, 431; in orchard house, 216.  
 Andalusian's face and legs, character, 263.  
 Anemones, in bed, 436; culture, 293, 294; drying roots, 353; from seed, 334.  
**Annals**, for croquet borders, 173; culture of hardy, 211; for spring flowers, 61.  
*Anthocharis Cardamines* butterfly, 315.  
**Anthurium**, Scherzerianum, 206; Wilkianum and Bortonianum, 411.  
 Ants, destroying, 176, 315, 351; destroying fruit, 318; in viney, 350, 391; on wall trees, 451.  
 Aphis, destroying green, 240.  
*Aponozeton distachyon*, 456.  
 Apoplexy in fowls, 55.  
 Apples, blossoms killed, 379; bud's graft, 436; critical days for, 379; pruning and training, 417; trees, pruning pyramidal, 16; bark coming off, 17; barked by sheep, 86; tree espalier wires, 167; trees, surface roots, 282; trees, treatment of old, 240; how to prune and train, 213; grafting on Pears, 215; tree roots, 286; Lady Hamilton, 32.  
 Apricots, crop, 8; forcing, 451; not setting, 263; shoots, pinching, 331; unfruitful, 391.  
 Aquarium glazing, 114.  
*Arabis clethrophylla*, 223.  
*Araceana imbricata* branches dying, 16.  
 Ariolas falling, 291.  
 Arch, a triumphal wedding, 273.  
*Aristida crenulata* culture, 371.  
*Aristolochias*, 352.  
 Arnott, Dr. Neil, 221.  
 Arrudel Castle, 11.  
 Ash, grafting Weeping, 191.  
 Ashes of turf, 339.  
 Asparagus, bed blanks, 419; forcing, 16; after forcing, 231.  
 Aspleniums, 329.  
*Aucuba japonica* showing, 333.  
**August**, plants for sowing in, 298.  
*Auricularia*, 13, 276, 328; culture, 233, 331; in culture, 236; leaves falling, 371; Mr. Moore's, 491; moving out, 282; repotting, 318; in winter, 110.  
**BATHON ORNITHOLOGICAL SHOW**, 42.  
 Ballard Botanical Garden, 60.  
 Balsam culture, 136, 416.  
*Bambusa striata*, 73.  
 Bantam, egg-bound, 21; with Creve-Coeurs, 48; with other fowls, 113; hatching, 340; Black, 115, 208, 229, 264, 281.

											19	6	35	7

From observations taken near London during forty-three years, the average day temperature of the week is 42.0°; and its night temperature 29.0°. The greatest heat was 57°, on the 3rd, 1860; and the lowest cold 11° below zero, on the 4th, 1867. The greatest fall of rain was 0.86 inch.

## THE NEW YEAR AND "OUR JOURNAL."

HIS first number of "our Journal" for the year 1874 will bear upon its first page the date of the first day of that year. The two will begin together hand in hand like two little children, the new year and "our Journal" hand in hand from the first day of the new year. On this day, the year being so very new, a great many people will begin their letters with a wrong date; many a D for December will be blotted over, and turned into a J for January. A great many threes will be turned into fours; for, somehow, 1874 won't come to the fingers' ends naturally; just as a very new bride, forgetting that after signing her name in the vestry of the old church at the old home, she has done with it for ever, will make a like mistake and write, or begin to write, her former name. But after a short while new year and new bride will come naturally to their places. Thus this year will be spoken of without the prefix "new," and "bride" will altogether be gone, and that best name of all, "wife," reign permanently. But however we may make a mistake for awhile in a word or a figure, yet none of us, save very new readers, will make a mistake in the name of JOURNAL OF HORTICULTURE, for it is getting an old periodical now; it has passed its coming of age, and even its twenty fifth birthday—it is more than a quarter of a century old, and like a man about that age, is better than in former years. Take, for instance, the engravings, which are twice in number to what they were some years ago, and, I make bold to say, twice as good. Among the engravings that gave me particular pleasure were those of Tortworth Court, and Beckett House, and Westonbirt, and Longleat, some well known to me, and the spirit and character of the places "L. B." has caught and well produced. Let her—for "L. B." is a "her"—go on cheerily in her work, and prove that woman's dainty fingers can be useful fingers, and woman's little light hand be a breadwinner in an art in which man had once no competitor. Let women take courage, and without noisy women's-rights meetings, they may find work, and excel in work, and be something besides cooks and governesses.

Nor let me speak only of the engravings of the past year. When old writers like old soldiers fall, I see others step into their places, and, if their hands lack all the cunning of the old ones, they have a freshness all their own. And in speaking of old soldiers falling, I feel I must speak of that special one, that excellent writer and excellent man whom we have this year lost—I mean, of course, Robert Fish. Much at the time of his decease was written of him, and nicely written, and feelingly written, in these pages of ours, but I must add yet a little more. Robert Fish knew what to say, and he knew also how to say it: these are rare gifts, or rather a kind of double gift. The man of deep knowledge so often lacks the power of pleasantly expressing his ideas, while the man who has a happy style has frequently but a small

store from which to draw. But not so Robert Fish: the wine was rich in body, and it came also bright-coloured and sparkling to the lip. Let me recommend a close perusal of Mr. Fish's papers to young contributors. For twelve years I read him closely, scarcely ever omitting an article, the style was so good, the words so wise. Let me ask younger writers to turn to Mr. Fish's charming contribution to our Christmas number of 1866; or if they have not that, to the piece which opened our volume for 1873. The latter he most kindly wrote in my place, for a terrible grief had caused my pen to drop from my hand, and his private letter to me on that occasion is among my veriest treasured letters. I knew Mr. Fish personally, and I am so glad I did. Some writers who please, do not please when seen in the flesh; they are men of the pen only, they feel all right, but are the slaves of an unhappy manner. Not one of these was Robert Fish—a little robin redbreast of a man (ah! how the little men do the work of the world with brain as well as body—*e.g.*, England's Lord Russell, and France's M. Thiers) with a cheery eye and nice address, and a shake of the hand in the pressure of which you felt his heart. (Oh! how I hate a hand just coldly put into one's own—a fin rather than a hand.) But there was one point which in the many notices of Mr. Fish—*viz.*, his eloquence of tongue, was not mentioned. I once heard him speak in public, and he was, to my surprise, an orator; his language choice, his tongue fluent. Gardeners, you have reason to be proud of Robert Fish! I scarcely ever knew a man of so complete a character, personally, literary, oratorically. He is gone, we have all of "our Journal" lost a friend. Young gardeners with now greater educational advantages than he had, press on in your profession, honour it, and bring honour on it. Be enthusiastic as to your profession, feel that none is its equal—that is what each man in every profession should feel if he wishes to excel in it. You gardeners, remember that you can boast of some living, whom I know, who have brought honour on old Adam's trade, and among them none wiser, kinder, abler than was Robert Fish. Peace to his memory. I write of him even now months after his decease with dimmed eyes. Follow him, men of the spade, read his writings, and each say, "I too will be what he was in character, if I cannot in ability."

In looking through the numbers of the past year I notice some indications of a revival of the love of old-fashioned ways and old-fashioned flowers. Thus there was an article, given the place of honour by our Editors, on avenues by one of our rising writers. It has often struck me that this artistic way of planting trees is not sufficiently followed now-a-days; perhaps because like "Pears, they are planted for our heirs" chiefly, and this is a hurrying, railway, rapid-developing age that does not like to wait; and money's worth is wanted for the money, and paid down at once, too. Belts of wood are imposing, massive clumps tell well. Openings cut in woods to let in views show taste and add to the landscape, and please as much as the atmospheric distances in Claude's pictures; but the old-fashioned avenue has its distinct charms, it

speaks of man's triumph over Nature's luxuriant wildness, and of mighty trees made to stand side by side, and each show forth the other's mightiness. Those to whom the Long Walk at Windsor is familiar, and still more the avenues of Bushy Park seen in May time when the Horse Chestnuts are in bloom, and the shorter but telling avenues at Hampton Court are known, will fully bear me out in the good taste displayed in a well-planted avenue, and the permanent pleasure which arises from such a planting of trees. There must have been at one time almost a rage for such an arboreal arrangement, for, if I mistake not, the majority of avenues are of about the same date. Cowper thus speaks of the avenue—

"Not distant far a length of colonnade  
Invites us. Monument of ancient taste,  
Now scorned, but worthy of a better fate.  
Our fathers knew the value of a screen  
From sultry suns; and in their shaded walks  
And long-protracted bowers enjoyed at noon  
The gloom and coolness of declining day."

And then he thanks his neighbour, the squire of Weston Underwood, who, he says,

"Spare me yet  
These Chestnuts, ranged in corresponding lines;  
And though himself so polished, still relieves  
The obsolete proximity of shade."

Pointing, I fancy, to many landowners of the day, who, influenced by "Capability Brown," scarcely left three trees in a line from Land's End to the Tweed: hence the poet says plaintively—

"Ye fallen avenues! once more I mourn  
Your fate unmerited, once more rejoice  
That yet a remnant of your race survives.  
How airy and how light the graceful arch,  
Yet awful as the consecrated roof  
Re-echoing pious anthems! while beneath,  
The chequer'd earth seems restless as a flood  
Brushed by the wind. So sportive is the light  
Shot through the boughs, it dances as they dance,  
Shadow and sunshine intermingling quick,  
And darkening and enlightening, as the leaves  
Play wanton every moment, every spot."

Nor must it be forgotten that the avenue was the great teacher of the Gothic architect. Gothic arches are but lofty trees of stone. Walk down the aisles of a cathedral—there you have avenues. The thoughtful architect took his hint from the lofty Elms, whose branches ran into each other. Gothic architecture, because imitated from Nature, is more beautiful than Grecian or Roman, and more suitable to become, as it has become, Christian architecture. We in a Gothic edifice seem to be worshipping the Creator in a place resembling His creation, for above is "the branching roof." Many a country church is tree-like,

"With pillars crowded, and the roof upheld  
By naked rafters intricately crossed,  
Like leafless underboughs in some thick wood,  
All withered by the depth of shade above."

With the revival of Gothic (Christian) architecture in this century the planting of trees in avenues may well and suitably be revived.

A lingering love, never wholly eradicated, for old-fashioned border flowers has cropped up and strengthened. I agree with the gay bedders for beds; we in England have over-much green, and want striking colours for contrast and variety; but I grudge that borders should have been invaded, and the term "ribbon border" ever been invented. It is now positively difficult to procure—at least I find it to be so—the border plants proper. Therefore never did I read (and I am sure many others) any articles with greater interest than those by "PANTALON" and my old friend Mr. Robson on Primroses and Polyanthus, which the former truly says were "long ago the delights of almost every garden." Then with the interesting letterpress came also in its midst those admirable engravings of the "Hose-in-Hose," "Pantaloon," "Galligaskins," and the rest—flowers which I have not seen for years. These papers are good signs, and I hope the cultivation of these and like flowers may be revived ere too late, for even in cottage gardens near me they are gone. "Lost them years ago," is the answer I get, for from mansion garden and rectory garden the bedders have travelled down to farm-house garden, to cottage garden. I, on behalf of hundreds of readers, thank all the writers on those interesting and sadly-neglected flowers.

Leaving now the flower department of "our Journal," I turn to that more particularly my own—my own from my scribbling in it for eleven years—the poultry and Pigeon department. The great event of the year is, no doubt, the pub-

lication of our Mr. Wright's grand work, a work which even in parts has had a marked influence on the poultry world in England and America. The other great influence, if I may so speak, is the great national Show at the Crystal Palace. Provincial shows are admirable and interesting, and the things for the provinces, and reflect the peculiarities of each part of the country; but everything national must be connected with the metropolis of the nation; and how fortunate we are in possessing—whether for fowls, Pigeons, dogs, Canaries, or cats—such an exhibition-room as the Crystal Palace. To exhibit the Game Bantams just over the Game fowls, and the eye thus being able to see the two at one and the same time, was a thought worthy of a genius.

Little need be said about the poultry, but I would just say this, that at any rate quite enough has been written about Malays, which are neither ornamental nor useful, and only interesting as our first-imported Asiatic fowls; while too little has been said of the Polish of all varieties, which, though they may not be a useful variety, are among the most ornamental at a show, and may be kept in an outhouse or small wired enclosure.

Of Pigeons I gladly chronicle that they are more admired than ever, more numerous than ever, and new fanciers are everywhere rising up. The Tumbler proper, the Flying Tumbler, had a class to himself at the Palace Show, and deserved it. Short-faced Balds and Beards also deserve encouragement, for no Pigeons are prettier or more distinctly marked. The Dragoons are also everywhere improved, and do not look like young Carriers.

In turning to Canaries, in which I am always interested though not a breeder now, the event of the past year is the discovery of the method of colouring by food. The defence by chemical analysis of the honesty of the method was searching, and the exhibitors enjoyed the triumphs of honest Englishmen. But yet a word of praise to Messrs. Bemrose & Orme for the revealing of the secret, which will be a benefit to all Canary fanciers, and even to all visitors at the shows.

Speaking of Canaries, there is a touching story told of Sir Joshua Reynolds, the first of the English school of portrait painters, when he became blind. He had always been deaf, but that matters but little, for there is so much more worth seeing in the world than worth hearing. If the eyesight be given and preserved, deafness is little felt. But the time came when the great painter's eyes grew dim indeed. Well, one day he was found by a friend wandering round the rails of his house in Leicester Square (No. 47; mark the number, lovers of painting and painters), seeking for a pet Canary of his that had strayed. He never could have heard the little bird's song, but he had formerly seen it. It was an old friend, and he wished it to be still his own, his pet. Scorn not little pets. The man who drew Mrs. Siddons as the tragic nurse, and wrote the great lectures on painting, and was the Royal Academy's first President, yet loved a little Canary. How tenderly are pets loved! how diligently cared for! But, perhaps, there is no instance on record of a whole city's people loving and tending their pets as that of the citizens and the Pigeons of Venice. A daughter of mine the other day was in the Great Square of St. Mark, at two o'clock, when the thousands of Pigeons are fed. Down they came at the sound of the bell, the city was alive with wings—from every quarter they came. A little Italian boy gave the young lady a packet of Maize; the Pigeons saw the act, and so tame and confiding are they, that my daughter's hands, arms, and shoulders were covered by the pretty birds. Oh! ladies who frequent Hurlingham Pigeon shooting, would you not look prettier—I appeal to your vanity, I will not try a higher feeling—covered by confiding happy Pigeons, than enjoying dying, bleeding, broken-winged, legless Pigeons?

But I must conclude. I know how "our Journal" tends to foster an innocent love for innocent things—I know the resources that a garden affords to those whose duties confine them much to one spot. Thus, a master of a Union, a winner of many prizes each year at a horticultural show, said to me, looking up from the pages of "our Journal" (he studies them weekly), "This place without my garden would be a cage." With it as a resource he lives on happily.

There is one other name I feel I must mention before my pen stops, it is that of Mr. Hewitt. "He who," as Mr. Wright truly says, "has devoted years of his life gratuitously to aiding, by his vast experience and knowledge in awarding prizes, the general improvement of poultry; he is among those who have done a good work for their country." Every reader of this Journal, whatever part he may specially read, yet well knows

Mr. Hewitt at least by name, but all do not know that his health is not now what all his friends (and we are all of us his friends) wish it to be, and also that he has had sorrow. I therefore wish editors, sub-editor, writers, readers in all parts a happy new year, and also add to that wish that the coming year may be a happier and healthier one to Mr. Hewitt.—WILTSHIRE RECTOR.

### WAR OF THE ROSE STOCKS.

I AM glad of the war of the Roses—not the York-and-Lancaster this time, but Briar v. Manetti. I have been expecting a vigorous Briareus to attack my article on Manetti, but no sign of a powerful onslaught has yet been made, except it be the statement of the length of shoot that has or can be made from a Rose on a Briar stock in one season; but as I have myself measured Général Jacqueminot 9 feet to 11 feet 6 inches in one season, and Gloire de Dijon on Manetti 17 feet, I do not think 13 feet 6 inches on the Briar quite such a poser. I question much whether it was on a standard, and if it was on a standard it would have nearly all to come away for the sake of the symmetry of the head. Again I say, Where there is a heavy clay or an unctuous tenacious loam, stick to the Briar, but then not as a standard, but budded on the seedling; or when a man does not care for a bedded-out Rose garden, and does not mind about an untidy quarter of Roses, and wishes to go in for amateur Rose-showing, let him each year bud on the Briar as many as he has room for, and dispose of them as best he may after the season.

Mr. Baker says he agrees with me in the main, but would not mulch. I do not mean by mulching putting on heavy wet manure, but warm littery manure, leaving air to the roots and stems, but still affording great protection from frost.

If I might venture to answer Mr. Camm's queries about Tea Roses for exhibition stands, I would say persons too often put in Tea Roses, not because they are really first-rate, but to diversify a stand. A really fine Tea Rose or Noisette, such as *Maréchal Niel*, *Souvenir d'un Ami*, *Madame Willermoz*, and others not only diversify but beautify a stand; but a second-rate Tea Rose is not better than a second-rate Hybrid Perpetual—certainly not so good as a first-rate Hybrid Perpetual. Tea Roses protected against a wall too often come in before the rest of the Hybrid Perpetuals, and then inferior blooms on side shoots are put into stands because they are favourites with the exhibitor, and because he thinks the judges will make allowances for its being a Tea; but they too often hang their heads, and appear as if they were ashamed of looking the judges in the face. Choose the best, the freshest, and most perfect-shaped Roses you have to put into your stands, never minding whether they are all Hybrid Perpetuals or not; but if you have a really good Tea by all means let it come to the front. Some rosarians have a *penchant* for flat Roses; some ignore the merits of *La France* because of a loose petal, and praise a Rose of the shape of an inverted Mushroom; some like dark Roses or dull-coloured Roses like *Felix Genero*, because they weather well; but an indulgence of these fancies on an exhibition table would seriously militate against the chance of a prize.

It is now three or four years since I was able to avail myself of the request to judge at the Crystal Palace. Saturdays for parsons who live two hundred miles away are not good days for Rose shows; but I have a very lively recollection of very good and pleasant dinners, under the auspices of the worthy Superintendent, Mr. Wilkinson; and I feel sure than any hint for a breakfast and pleasant meeting for rosarians would be quickly carried out, as one especial feature I have always noticed at the Crystal Palace is their readiness to accommodate the public, and to accede to any proper request. So I hope Mr. Farren will succeed in satisfying his wants, both of a good breakfast and a good talk. Roses—to the front.—C. P. PEACOCK.

### HOW TO TREAT CAMELLIA BUDS AND BLOOMS.

At this time of the year there is generally a great demand for Camellia buds and blooms, and unless there are houses containing large trees planted-out it is difficult to obtain enough without overtaxing the few trees that can be kept in a miscellaneous collection of hardwooded plants. It is not every person who has such housefuls as are to be found at Bieton, Sion, Chatsworth, or the Exeter Nurseries—I have driven-out cartloads from the latter. We not only, by cutting a bloom with the wood to it, run a risk of destroying the means of producing a crop of flowers in the following season,

but also of reducing the already-too-small tree, and then there is the loss, in most instances, of the unopened bud that will in the majority of cases be situated near, and which would be most acceptable by-and-by. I think, therefore, your lady readers who have but a plant or two will thank me for giving them a hint on this subject.

Now, the remedy I adopt is a great advantage to the tree, and not less so to the person for whom the bloom is intended. It is simply to pull-off the bud or open bloom gently from the plant, leaving the wood and an open bud for further service, and place it on wire. The bloom answers the same purpose without the wood as with it—nay, even better, for it is not liable to be knocked-off, as is often the case when left on the wood. It can at the same time be better arranged to suit the button-hole, the hair, or in hand bouquets. Of course, the wood is necessary when blooms are employed for specimen glasses or stands for table decoration; even then it is a wise plan to thrust a few wires through the base of the flower, thus keeping it together for some days longer than it would otherwise do.

I take the buds or open blooms without wood, and thrust about four or five bouquet wires into the base of the petals, place the blooms at the required distance—this is easily done by having the wires of different lengths—then twist the wires all together close at the base of the flower. I have then two leaves of the Camellia also placed each on a wire, and neatly put one on each side of the flower, with a good moderate-sized frond of Fern at the back, and with just a small bit under the front of it so as to hang down a little carelessly. Now gently twist the wires together so as to form a stem about 2 inches long. The work is then done. The bloom will last a night well, and will give greater satisfaction to the wearer, and, of course, to the gardener (nothing exasperates him more than having to cut too much at his Camellias), for he knows that “his” plants are none the worse of the blooms being removed.—J. T., *Maesgwynne*.

### STRAWBERRY FORCING.

I SUPPOSE we have all heard of the famous culinary recipe that commences with “First catch your hare.” No really good cook would attempt to make hare soup without at least a small portion of that animal to flavour it with. To beginners in forcing I would say, First have properly prepared plants. It is useless to attempt to force fruit on a plant that has not already perfected its arrangements to bring forth flowers. The flowers must be there in embryo and ready to burst forth when the necessary heat is applied; the plants must also be ripened to a certain extent. By the number of failures we read and hear of year after year it would seem that this is not thoroughly understood, because Strawberries are certainly not more difficult to force than many other fruits when once we have the plants and suitable accommodation.

Whatever the size of the pots used, they should by the middle of September at the latest be so full of roots, that on turning a plant out scarcely a particle of soil can be seen amongst them. This accomplished, all the rest is easy. The pots should be kept on a hard substance to prevent rooting through—mine are placed on inverted 60-pots. The plants will perfect their crowns and ripen in spite of sunless weather and autumn rains, and by the end of November most of the outside leaves will have changed colour, and all will appear almost dormant.

Those who have plants of this description may commence at any time; and those who have nothing but soft green leaves, whatever size their plants may be, had better throw them away and have some clean 7-inch pots and stiff loam, such as *Melons* delight in, ready next June, and I will then tell them how to start afresh. It is useless to attempt to do anything with unripe plants; nearly all the art of forcing lies in preparing the plants beforehand. This applies to flowering plants generally as well as to those grown for their fruit.

To have good fruit ripe by the first or second week of April the plants should be placed in a little warmth not later than the first week of January. To plunge them in a bed of warm leaves and cover with a frame, is a good old plan that is not yet beaten for the earliest batch or two, giving air whenever the temperature can be kept up to 48° or 50°, removing the lights altogether during mild weather, and covering a little during frosty nights. In a mild season this treatment may be continued till the crowns fairly begin to open, when the plants should be removed to a light house or pit where a temperature

of 50° to 55° can be maintained, with a little air constantly. This temperature should never be exceeded by artificial means—it may rise higher by sun heat—till the most forward flowers are perfectly open, when the latest ones may be picked carefully off or cut with Grape-scissors, leaving not more than eight or ten of the largest and most forward, and the temperature may be increased considerably. When the fruit has fairly started swelling it will bear with impunity the heat of a Melon or Pine house, but must be kept cooler at the first sign of colouring; and finally after it is coloured must be kept quite cold and have abundance of air for a few days.

If the treatment I have attempted to describe has been carried out, and watering properly attended to, the fruit will be equal in flavour to that ripened out of doors in June.

The principal points to attend to are—To force very gently till the flowers are perfectly formed; to attend strictly to watering—once let the plants get really dry, the fruit will never be good for anything; to keep the plants always in a light situation with continuous ventilation, not necessarily close to the glass as many suppose—they may be 60 feet from it provided there is nothing to obstruct the light. Some people seem to have an idea that there is something about glass for plants to feed on. Perhaps it is the condensed steam. We are continually being told to keep the plants close to the glass: it may be necessary to do so in those old-fashioned houses, now happily fast disappearing, where there is a greater breadth of timber than glass used in the construction of the roof; but in the modern light-built houses it is preferable to keep the plants at a little distance from the glass, where the atmospheric changes are not so violent. Lastly, it is of the greatest importance to finish the ripening process in a cool place with abundance of air.

The sorts I depend on for in-door work are Keens' Seedling and British Queen. If Strawberries are wanted before the end of March, Black Prince is the best for the purpose; but they will only be Strawberries in appearance, not in flavour.—WM. TAYLOR.

### THE WEATHER.

No one can remember a milder December; it seems, as Shakspeare describes a similar season, as if Time "had found some months asleep and leapt them over." In Holland Park, Kensington, the rooks are repairing their nests; we hope they will not marry, for an inclement season will soon be here, and the description will apply—

"Then into their nests they paddled,  
Themselves were chilled, their eggs were addled,  
And they parted without the least regret  
Except that they had ever met."

From Malton in Yorkshire we were informed on the 21st that only on three days of the month any rain at all is recorded—0.04, 0.03, 0.04, or a total of 0.11 inch in twenty-one days. The thermometer twice reached 57°, varying 43° in three days—i.e., from 14° on grass on the night of 13th, to 57° at 4 feet above ground on the morning of the 16th. The barometer was never lower than 30.35 inches between the 1st and 15th, and a gale of unprecedented pressure occurred in Mid-Yorkshire—i.e., Sheffield, Leeds, &c. Not one flake of snow has been seen—a thing our informant never remembered in Yorkshire, as generally they have snow before October is out. They have had hard white frosts, but the Wheat is looking wonderfully well. They were fifteen days in succession without rain in November, and sixteen in December.

At Linton Park, near Maidstone, the report on December 22nd was—"We have remarkably mild weather in the country. Some of the Geraniums in the vases are not yet killed by the frost, and the roads are next to being dusty."

At Torquay on Christmas-eve the thermometer was at 51° in the shade. No wonder that the swallows still linger about the southern shore, or that Roses, Carnations, and Stocks still perfume the air.

### FLOWERS FOR OUR BORDERS.—No. 23.

BOUVARDIA AURANTIACA. — ORANGE-FLOWERED BOUVARDIA.

The species of *Bouvardia* are not very numerous; the oldest and best known is the *B. triphylla*, which has been cultivated in this country for nearly fifty years. The specific name of this species would naturally lead the inexperienced botanist to suppose that the triphyllous arrangement of its leaves was peculiar to it; but it is by no means distinctive, the majority

of the other species, including that now figured, having foliage of the same character.

Of the species just referred to there are several varieties—pubescens, glabra, and splendens; though this last must not be confounded with the true splendens, which is a distinct species, and, in our opinion, preferable to either triphylla or its varieties. Other very desirable species are angustifolia, versicolor, Jacquini, Cavanillesii, and leiantha, all with scarlet or red blossoms; flava, with yellow; and longiflora, with white flowers. *Leiantha* and *longiflora* are natives of Guatemala; most of the other species have been received from Mexico. They are all of comparatively dwarf habit; in suitable soil, however, plants bedded-out in spring will, by the end of the autumn, make shoots from 2 to 3 feet long, with numerous lateral branches. Where it is thought desirable to restrict the growth of the shoots they may be stopped, which

*Bouvardia aurantiaca.*

will induce a more compact habit; but this will rarely be necessary. They are readily increased by cuttings about three joints long, which may be taken off at any period during the summer, and inserted in light sandy soil. A little bottom heat will materially shorten the time required for the emission of rootlets; but we have struck them even in August without any such aid. They are rather liable to damp-off, unless the interior of the glass be wiped regularly each day; and as soon as they appear rooted the glass should be removed at night.

*Triphylla* does not root so readily from cuttings as *splendens* and some others; that, as well as most of the species, are sometimes increased by short pieces of the roots in spring, which should be planted in pots of light soil, with the ends of the cuttings exposed above the surface. If placed in a good Cucumber frame they will soon make nice plants. As, however, most of the other species may be easily increased by cuttings of the young shoots, we venture to recommend them in preference to *triphylla*. Any of them may be purchased for a shilling, or even less in some places. They will flourish most in the same description of soil as that employed for *Verbenas* and other bedding plants; but with proper precautions against drought in summer, they will succeed in most soils, except those of a stiff clayey kind.

As window plants they deserve especial attention. The abundance of their flowers and their neat habit render them in our opinion extremely desirable. During winter they require

but little attention, as most of them lose their foliage, and may be kept dormant, like the Fuchsia, Lemon-scented Verbena, and other window plants. In spring they should be pruned rather closely and repotted in fresh soil, using a pot suited to the size of the plant.

Although they have no known economical uses, the order to which they belong is one of the most important in the vegetable kingdom; furnishing the various species of Cinchona or Jesuit's Bark, from which the invaluable quinine is prepared; the Ipecacuanha; and the Coffee plant, whose produce, if not more useful, is at all events less unpalatable and more generally welcomed.

The genus *Bouvardia* was named in honour of Dr. Charles Bouvard, Curator of the Paris Botanic Garden.

Since the original publication of these notes, not only the *Bouvardia aurantiaca*, but also most of the other species and varieties named above, have been superseded by the introduction of several hybrid forms with much larger flowers, raised by the late Mr. Parsons, of Brighton, between the white *B. longiflora* and *B. leiautha*, and cultivated under the names of *B. Hogarth*, *B. Oriana*, &c. These in their turn are likely to be pushed aside by several more recent introductions of the Messrs. Henderson, of the Wellington Nursery, the most remarkable of which, *B. Humboldtii corymbiflora* and *B. jasmimoides longipetala*, deserve especial mention for the large size of their individual blossoms and the profusion with which they are produced. Invaluable as they may prove for the conservatory and greenhouse, they are, however, probably more delicate than the earlier hybrids of Parsons', which are better suited for the open air, or for the window of the amateur. The American variety offered under the names of *B. Vreelandi* and *B. Davisoni* is but a sport from the *B. Hogarth*, and although useful as a pot plant, does not retain the whiteness of its flowers when planted out.—(W. Thompson's *English Flower Garden*, Revised by the Author.)

## THE ELECTION, PROTECTION, AND STOCKS OF ROSES.

THERE are two holes described by Addison in "The Spectator," the button-hole bore and the periodical scribbler. The former is described as catching hold of your button-hole, and proving to a demonstration that two and two make four, and that as long as the world lasts seven will always be more than six. The latter scribbles periodically. I suppose I shall illustrate both; but my apology must be that it is a dull time of the year, and that the readers of "our Journal" like to hear something concerning Roses.

I.—*The Election of Roses.*—Though kindly asked by Mr. Hinton (to whom, with electors, thanks) to contribute, I was unable at that time to do so, because I did not know the true dates of the Roses. Having seen the Roses named, I can now say a few words. I believe Edouard Morren was a Rose of 1868, and I think Velours Pourpre must be a much older Rose. Of the Roses named, these I believe to be good—Edouard Morren, Countess of Oxford, Louis Van Houtte on a seedling Briar, Marquise de Castellane, Baroness Uxkull, Abbé Brametel, Baron de Bonstetten, Ferdinand de Lesseps like Maurice Bernardin, Madame George Schwartz, Etienne Levet, and Madame Hyppolyte Jamain, a nice Tea Rose. At the Dorset Nurseries Etienne Levet was said to be the best novelty, and Félicien David next best. I shall know more of these and others next year, as I have them on strong stocks. Judgment of plants under glass, and on weak or unsuitable stocks, can be only approximation, and may be worthless. I speak slowly, because it is a serious matter to many persons of small fortune to do otherwise.

Some of the very best Roses of late years, and such as I can confidently recommend, are Felix Genero, Marie Rady, Edouard Morren, Baroness Rothschild, Clémence Raoux, Thyra Hammerick, and the two Tea Roses Madame Margottin and Madame Hyppolyte Jamain, and I think I should add Marie Sisley. Mine, however, is not a "Tea" situation. I doubt if in that family Devonensis and Souvenir d'Elise Varden have ever yet been beaten. These Roses are good growers, and passed a good degree here last year—namely, Vicomtesse de Vézins, Monsieur Woolfield, and Monsieur Journeaux (Marest). Captain Lamure, Henri Pages, and Monsieur Cordier I have cast out as worthless here.

2.—*New Roses.*—A prophecy is not a fulfilment. I will, however, venture one, and have bought, or shall yet buy, the Roses I name. I think, from what I read and hear, these

will be good, or some of them—Firebrand, Reynolds Hole, Claude Levet, Félicien David, Madame Lacharme, and Pierre Seletzky. The last is a good grower, and, though budded in June last year, it made 18 inches of good wood. Mr. Cant speaks of it as a capital Rose. I shall order the first two; the others are here.

3.—*Winter Protection.*—I bought a load of fern for 10s., including carriage. With this and a little earth over the fern I shall make my 2100 Roses safe at the roots and over the point of union. I see Mr. Prince recommends drawing the earth (as with Potatoes) over the roots till the severity of the winter is over. Some winters there is need of little or no protection, but when zero comes in earnest, then we be to unprotected Roses. There is such a thing as the "beginning of the end." Roses injured by frost or other things may not die at once, but they die eventually. Possessors of Roses, and rosarians, are often very different persons. One thousand Roses well looked after will give more satisfaction than five thousand Roses maltreated and haphazardly by reason of mere wealth, or supineness, or ignorance. Roses in the same family require different stocks, different soils, and different treatment altogether.

4.—*Stocks.*—I am much pleased with Roses on Mr. Prince's seedling Briars; they are masterpieces of propagation. They are the very stock for Louis Van Houtte. I have made a bed of fourteen of it. All the plants match. I shall run these fourteen on the Briar against twenty Baron Chaurand on Manetti. They are both in beds by themselves. Accumulation of the same colour is very effective.

I am truly glad to see so many speak-up for the Manetti stock. I remember the time when I was the only amateur who could say a good word for it. The faults were with the propagator and the planter. The failure of the Briar is often to be attributed to the bad quality of the Briar, to the planter and the pruner; they are not cut hard enough the first year, and are often planted too deeply.—W. F. RADCLIFFE.

## NOTES FROM MY GARDEN, 1873.—No. 1.

It is not given to everyone to have either the means or talent to produce such a volume as that of Mr. A. Smee, or to make "My Garden" a household word, but we may all of us to some degree carry out the principle which led to the writing and publishing of that book—viz., that our own personal experience is after all the truest guide we can offer to others. We speak then, not from hearsay but from practical knowledge; we can tell of successes or defeats, and encourage one another. And while—without incurring that bitter reproach of Montaigne's, that our highest enjoyment is in contemplating the misfortunes of others—a true gardener must rejoice at the successes of those who are following the same pursuits, and when he hears of their failures he comforts himself with the idea, "Well, it was not all my stupidity; I am not singular in my misfortune, and I must therefore only try again." When, for instance, I stood mourning by my Roses over my ignominious defeat by the orange fungus, it was some little consolation to me that a rosarian so enthusiastic, so devoted, and so intelligent as my friend Mr. Camm had to confess to defeat also. I was not glad that he had suffered, but I felt, "Ah! then this is a common foe, and others besides myself have felt his power." I have thought, then, that a survey of one's doings during the past year might be of interest to some of your many readers, who will, it may be, take from the failures and successes of a brother gardener fresh hope for another year's work.

And in order that I may do this more effectually it will be well first to describe my garden. It has not the slightest pretensions to beauty. It would give my friend Mr. Peach an attack of indigestion, for bedding-out is at a discount in it; and when my friends and neighbours say, "Oh! you must have a beautiful garden!" I am constrained to say, "Not a bit of it. I had not the laying-out of my garden, and I never could understand on what principle it was laid out." Trees were planted anyhow, and at the bottom of the garden there used to be a pond—this has been filled-in with made earth. The other parts of the garden are of a rich blackish earth, somewhat light—too light, I fear, for Roses, but suiting most other flowers well. "Our village" we are fain to look upon as the *beau idéal* of an English village. We lie snugly nestled under the brow of a hill, but not at its base. There is a large flat place about two-thirds down the hill, and the ground drops away again for some considerable distance, so that while sheltered it is not low. Close by the church there are some of the most extra-

ordinary springs I have ever seen. They bubble-up from the chalk; and so great is their volume, that at 50 yards they make a current sufficient to turn a mill. In fact we are surrounded by springs. One rises in my garden, and I have, by means of what is called in these parts a "dip," a plentiful supply of water. I wish I could say it is of the best quality for gardening purposes, but as it rises in the chalk and is largely impregnated with it, it is of course hard, and is, I believe, very injurious to hardwooded plants. The one great want of my garden is a wall, but I am in good hope of being able to remedy this want before long; if so, it will be in a good aspect for fruit, facing about S.S.W. I have not much shade, and am now rather in a fix as to where I shall place my Auricula frames for the summer if my wall is built, for the shady place they now occupy will be demolished.

My glass is not very extensive. It consists of a span-roofed house about 20 feet by 10, and a smaller and lower house connected with it. The upper house is devoted to Azaleas, Camellias, Pelargoniums, &c.; the lower one is filled by a couple of Vines, and is used for many purposes—putting Camellias in after they have done blooming, Hyacinths when they are first taken out of the bed of leaves in which they are plunged, Chrysanthemums when they come into flower, &c. Besides this I have a five-light pit in which I winter Carnations and other plants, and afterwards grow a few Melons; a small house for blooming my Auriculas, and of course my Auricula frames; a large Cucumber frame; and for my winter or rather early spring salading a goodly length of Looker's Acme Protectors. Besides this I have about half an acre of light sandy soil in which I grow Potatoes, &c.

It will thus be seen that in many points I am not unfavourably situated. Soil is good except for Roses, climate excellent, and situation sheltered; my disadvantages being the hard nature of the water and want of shade. My gardener is a factotum—groom, gardener, &c., does what he is told, but is not enough of a gardener to fancy he knows more than his master. The flowers I especially cultivate are Hyacinths, Auriculas, Roses, Gladioli, Picotees and Carnations, and the Ranunculus; and as I can go on with them from March to October, I can always tell my friends, "Although I cannot show you a garden, I can, if you are a lover of flowers, always show you something worth looking at." Such is my garden, and of the results of my gardening during the past year I hope to tell in future papers. I am sorry to say there is one thing I take shame to myself for—my garden is not as tidy as it ought to be; but it is difficult, unless where you can afford plenty of labour, to keep a florist's garden in good order, and I must say in extenuation of myself that I never saw a garden in which weeds thrive so vigorously; the Sow Thistle, especially, is a most inveterate plague. I hope the garden is improving in this respect, but still it is not what it ought to be, or what I hope it ere long will be.—D., Deal.

### ALPINE PLANTS FOR WINTER BEDDING.

THE person who does not admire the great majority of hardy Alpine plants is not to be envied, for he debars himself from one of the most beautiful and interesting fields of study and observation which the flora of the world affords. That these, in most instances, tiny gems are coming more into notice, is certainly a matter for congratulation. Besides much else that can be said for a great many of them, it can be said that as the freshness and beauty of other hardy flowers decay, the freshness and charms of many of the Alpine plants are most conspicuous at the "fall of the leaf," and downwards through the winter. In whatever way they are arranged or grown, they are always objects of great beauty and interest. A well-arranged collection of Alpines, whether in pots, in a mixed border, or on a properly-constructed rockwork, is sure to give much interest to their votaries every day in the year. And these are common enough ways of cultivating and arranging them, and not a word can be said against them. But the use of these gems as carpeting or bedding plants is as yet comparatively rare. We are, however, convinced that their extreme attractiveness when so used—in groups and in quantities together—is not so well known and appreciated as it should be, and it only requires a few striking examples of Alpine bedding to commend this system of planting them to all lovers of winter gardening.

Indeed, it would seem that, from the way nature nurtures these lively plants, to cultivate them in large surfaces is the correct way of bringing out their striking beauty to perfection. Look, for instance, at a small morsel of some of the glaucous

Sedums and beautifully-incrusted Saxifrages, and then go and view the same plants by the square yard and see how very much more striking they look the one way as compared to the other. And this is exactly how they show themselves in their natural condition.

We would advise some of our readers who have a series or group of beds not very large in their gardens, to try the bedding of these gems after the following method. Suppose a circular bed rising somewhat cone or globe shaped to its centre. Let the first ring next the box or grass edging be of *Sedum dasyphyllum*, the second ring of *Saxifraga rosularis*, the third of *Sempervivum californicum*, the fourth of *Arabis lucida variegata*, the fifth of *Saxifraga longifolia vera*, and the sixth or centre of the bed be *Saxifraga ceratophylla*. The rings formed of these should be a few inches in breadth; and seen in such breadth, and in concentric rings, their individual beauty is much more conspicuous than when mixed up in small patches with other plants. This is just one example of scores of combinations and plants that could be adopted. Then for carpeting, how charmingly beautiful is a carpet of *Sedum dasyphyllum* or *Sedum acre aureum*, or *Thymus tomentosus*, or *Saxifraga glabra*; *Veronica repens*, *Veronica alpestris*, *Pedicularis glabra*, and many other beautiful dwarf spreading plants which will occur to the minds of all acquainted with Alpine flora, and which supply colours almost as varied as the summer bedding plants, and aspects of vegetation far more chaste and interesting! Take, for instance, a bed covered densely over with the quite brownish grey, edge it with *Saxifraga rosularis*, or *S. incrusteda*, or even *Sedum acre aureum*, and dot the centre or body of the bed, at intervals of 8 or 9 inches, with large well-developed plants of that gem among Saxifrages, *S. longifolia vera*, and there will be produced a bed that must look charming the whole winter, or, indeed, the whole year. This is another combination only indicative of what can be done with the family of hardy Alpines in the way of grouping.

Then for dressing the surface of beds in which Hyacinths, Crocuses, Tulips, &c., are planted for early spring-flowering, what could excel as a beautiful carpeting, or what could show off bulbous flowers to more advantage, than the dwarf plants named above, and scores of others which might be mentioned? If these plants were difficult to propagate or keep, we would hesitate to recommend them for such a purpose; but most of them are so easily managed, and propagate so rapidly, that they can be grown in breadths in any out-of-the-way corner, and many of them lifted in great tufts and planted with the greatest ease, and without any check or injury to themselves. The low, dense-growing, surface-rooting Saxifrages, Sedums, and Veronics, *Antennarias*, &c., should be planted on a few inches of soil spread over a hard surface, and when required, as indicated above, late in autumn for planting and carpeting, they can be lifted without check in any size or shape of tufts required.

Beautiful as are *Alternantheras* and other plants used for summer carpeting, we do not consider it any disparagement to such plants to say that they are not nearly so interesting to an observant mind and eye as are these gems of beauteous hues and more beautiful construction, which, in addition to their beauty, are so hardy that they put on their best dress as other plants unclothe themselves of foliage and flowers. We hope our readers will be induced to try this style of grouping or planting Alpine plants, and that they will report on them in due time. It is a system of hardy gardening which only requires to be begun to become one of extreme interest and beauty.—D. THOMSON (in *The Gardener*).

### THE POTATO DISEASE—LORD CATHCART'S PRIZE.

It will be seen from the report of the Judges appointed to examine the essays on the Potato disease sent in in competition for the prize of £100 offered by Earl Cathcart, that this praiseworthy attempt to arrive at some settlement of the vexed question of the primary cause of the disease and the best means for its prevention, has ended in a failure, notwithstanding the fact that no fewer than ninety-four essays were sent in. The comments of the Judges will be found below. In introducing the report at a recent meeting of the Royal Agricultural Society, Mr. J. Dent Dent, M.P., said that the Committee had received the Report of the Judges who were appointed to award the prize offered by Earl Cathcart for the best essay on the Potato disease and its prevention, and after

considering the recommendations made in that Report, they begged to give notice that at the next Council they would ask for a grant of £100 to carry out the first recommendation of the Judges. They proposed that a special Committee, consisting of Lord Cathcart, Mr. Whitehead, Mr. Jabez Turner, Mr. Wakefield, Mr. Brambreth Gibbs, Mr. Brown Jones, Mr. Algernon Clarke, and Mr. Carruthers, be appointed to consider the suggestions 2 and 3; if they think it desirable, to draw out in detail a scheme for further investigation into the growth of the Potato and the incidence of the Potato disease, and to submit such scheme to the Council. The Committee further recommended that the Royal Agricultural Society of England should carry out its own independent investigation, but as far as possible in concert with the other national societies. This Report was adopted.—(*English Mechanic*.)

The following is the Report of the Judges on the competing essays:—The Judges appointed by the Council of the Royal Agricultural Society to examine the essays competing for the prize of £100, offered by Earl Cathcart, for the best essay on the Potato disease and its prevention, have the honour to report as follows:—They have examined ninety-four competing essays, and have carefully re-examined twenty-three selected from the total number. They are desirous of expressing their recognition of the great pains bestowed upon the preparation of some of these essays, especially in the collection of facts relating to the history of the Potato disease, and to the various theories that have been promulgated as to its cause and prevention. The theories most frequently advanced by the essayists, either for affirmation or contradiction, may be stated as follows:—

#### CAUSE.

1. Degeneration of the tuber.
2. Fungus on the tuber.
3. Wet weather, and generally superabundant moisture.
4. *Peronospora infestans* attacking the foliage.
5. Electricity.
6. Pléthoric, or succulent, or diseased condition of the plant caused by the use of specific manures.

#### PREVENTION.

- Use of new sorts for planting.
- Steeping, or kiln-drying the tuber previous to planting.
- Use of lime as a manure.
- Clumping, tamping, or hilloek-growing, bending haulm downwards, clear of the tubers. Tying haulm upright to stakes, or growth of sorts having erect stalks.
- Dressing haulm with sulphur, chlorine, &c.
- Cutting off tops on appearance of disease.
- Sowing disease-proof sorts (either specially mentioned, or generally, as very early and very late vigorous sorts).
- Use of lightning-conductors of various modes of construction.
- Avoidance of the use of certain manures.

A number of other theories were also advanced, but it is not necessary to particularise them. Like the foregoing they have, probably without exception, been for many years familiar to those acquainted with the practice of Potato growers, or with the literature of the subject. Amongst the ninety-four essays abundant evidence may be collected both in support and in contradiction of any of the foregoing theories; and it is especially noticeable that the essayists generally consider it sufficient to assign a cause and a mode of prevention of the Potato disease, without giving any scientifically accurate theory of their proposed remedy, or sufficient experimental proof of the accuracy of their statements. The Judges are, therefore, unable to admit that any essayist has established the truth of this theory, particularly as the first condition attached to this offer of the prize is, that "all information contained in prize essays shall be founded on experience or observation."

Like the theories of the cause of the disease, the practical suggestions made with a view to its prevention do not go beyond those with which agriculturists and horticulturists were previously familiar; and, as regards the botanical part of the subject, it must be confessed that all the essayists appear to be in arrears of the present condition of scientific knowledge.

The Judges have, therefore, but with much regret, come to the conclusion that, in accordance with one of the conditions\* on which the prize was offered, they must recommend the Council not to award it to the writer of any one of the essays that have come before them.

The Judges have authority to say that Lord Cathcart hopes the Council will apply the amount of his intended prize in

\* The Judges were not bound to award a prize, unless they considered one of the essays deserving of it.

any manner that in the interest of agriculture may seem most advantageous.

Power having been given to the Judges to report as to the advisability of a grant being made for further investigations into the incidence and prevention of the Potato disease, they have carefully considered this question. They are much impressed with the national importance as well as with the difficulties of the subject. Therefore, while considering that the Society might, and probably would, confer a great benefit on the community by inaugurating a sufficiently extensive inquiry, they feel it their duty, before recommending a course of proceeding, to especially call the attention of the Council to the fact that no reliable results can be expected unless experiments are made simultaneously at many different places, and continued for many years in succession.

Presuming that the Council is willing to grant the funds necessary for such an investigation, the Judges have drawn up a scheme, which they have based on the following facts:—(1), The natural history of the Potato fungus, from the time it attacks the foliage until the Potatoes are harvested, is now well known; but the history of the fungus from the Potato harvest until its re-appearance the following year is at present entirely unknown, and, therefore, offers a suitable field for investigation. (2), The Potato fungus does not usually attack the foliage of the Potato until an advanced period in the growth of the plant; and it has been confidently asserted by several essayists, as well as previously in the public press, that certain sorts of Potatoes are what may be termed "disease-proof," on one or other of the following grounds:—(a), That the haulm dies down (and the Potatoes arrive at maturity) before the period at which the Potato fungus commonly makes its appearance; (b), That certain late kinds also are, as the result of experience, believed capable of resisting the attacks of the Potato fungus; (c), That certain new varieties are also able to resist the attack of the fungus.

The Judges therefore recommend—(1), That a sum of money (say £100) be granted for the purpose of inducing a competent mycologist to undertake the investigation of the life-history of the Potato fungus (*Peronospora infestans*) in the interval between the injury to the Potato plant and the re-appearance of the fungus in the following year. (2), That valuable prizes be offered for—(a), The best disease-proof early Potato; (b), The best disease-proof late Potato. The Judges appointed to award these prizes should be allowed three years to experiment with the competing Potatoes, and with the produce of those kinds which may be found to resist disease, in reference to their cropping, keeping, and cooking qualities. (3), That in order to encourage in the meantime the production of new varieties which may have the qualities already indicated, the Council should offer prizes for disease-proof Potatoes of new varieties to be sent in for competition in the year 1878, on terms and conditions similar to those already recommended. The Judges are of opinion that although all the experimental trials with the competing Potatoes should be under the supervision and control of one and the same Committee, yet that the Highland and Agricultural Society of Scotland, the Royal Dublin Society, and the Royal Agricultural Society of Ireland, might be invited to aid in an investigation of such magnitude, on the ground that the interest of Scotland and Ireland in the prevention of the Potato disease does not yield in gravity to that of England and Wales.

(Signed)

CHARLES WHITEHEAD,  
JOHN ALGERNON CLARKE,

WILLIAM CARRUTHERS,  
H. M. JENKINS.

## THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 13.

DURING the winter season, while labourers are engaged in trimming the hedges, and making-up the roads—and in the course of agricultural operations, waste ground along the sides of fields is often turned-up with the plough or the spade—hibernating humble bees are occasionally dislodged from their winter nests, considerably to their discomfort if not to their peril. It may happen that the worker, not expecting to unearth an insect, tumbles over the unfortunate bee with the clods of earth, dry grass, and *débris* he is turning up, and does not perceive it, in which case the bee may struggle forth and escape with life; but should the bee be seen, and the individual be a person himself interested in the pursuits of the garden, he will likely enough avail himself of the opportunity of dispatching a presumed enemy in a semi-torpid condition. More particularly will he be inclined to do this if he has sufficient know-

ledge of entomology to be aware that the destruction of humble bees in winter has much more effect towards the diminution of the race than the killing of a corresponding quantity in the summer time.

The prejudice against humble bees in the minds of some does not so much arise from a dread of the sting of these insects—for indeed it is very commonly, though erroneously, believed that they have no power to sting; but it is a matter of everyday observation with those engaged in horticulture that a humble bee, busy according to the proverbial character of the race, and seeking for honey, very often attacks the outside of a flower and cuts through the petals with its mandibles. This, which is not the invariable practice of any species, arises simply from the inability of the insects to reach the honey lying at the bottom of long corollas. To a very small extent, therefore, humble bees may be said to be disfigurers of flowers, yet they cannot deserve to rest under the stigma of belonging to the injurious insects, but quite the contrary, since they help in no small degree towards the fertilisation both of garden flowers and the bloom of fruit trees by conveying pollen from place to place. It might be pleaded in addition that several of the *Bombi* are decidedly handsome insects, and by their lively motions, and pleasant though perhaps monotonous hum, gratify our æsthetic sense. All, however, have not admired their vocal performances, or the insects would not have got the name of "Bumble bees" or "Dumbladores," and these, or at least the former, got transmuted into "Humble bees,"—surely not by a cockney! It would be a mistaken inference to suppose that these Hymenoptera have any notable amount of humility as compared with their brethren. Also in some countries they have been known as "Foggies," possibly "Fogies;" and certainly humble bees have at times a fussy way of going about which might subject them to the charge of old-fogginess. In disposition they are most pacific both towards other insects and mankind, though through a brief period, during the hatching of the eggs of

This is a common but no catholic (*i.e.*, universal) custom." And he proceeds to show that if their supply of honey or pollen runs short they will go to any plant that will serve their purpose without regard to species. As no apiarian I hesitate to give an opinion as if *ex cathedra*, even with regard to the humble bee. But it cannot have escaped the notice of most naturalists that this insect, as contrasted with the hive bee, is of a more roving turn. I can hardly see that the one-species theory can be maintained with reference to it. Were it so, not much credit would be due to it for anything done in the way of fertilisation. That these insects exercise a "natural selection" of some sort is obvious, yet it does not follow that at any particular time all the residents in a district pursue the same plan. Different hives or colonies may vary.

The humble bees that await, through the rains and frosts of winter, the coming-in of the vernal season, are all of them of the fair sex. Ancient ladies they, as age is reckoned in their communities, yet not maidens, for each one becomes a prolific parent in the spring. Having shaken off the drowsiness of a six or seven-months sleep, the first object of the survivors of

the brood of the previous year is to discover a suitable spot for the location of a colony. The abode may be constructed of moss or grass, if such be the habit of the particular species; or should it be one that has an underground nest, the females fly in search of some hole already excavated: the deserted nest of a mouse or the gallery of a mole is applicable for the purpose. "Many hands make light work," and the mother in prospective of a happy family of humble bees finds that assistance will be a desideratum. Hence it is with great interest that the females watch for the appearance of the first hatch, composed only of neuters, which work diligently at the task of extending the cells and carry on the general business of the colony. Aware, seemingly, by her instinct that the failure of this brood would upset all her hopes of success, it is just at the season when the neuters ought to come forth that the

Fig. 1.—Nest of the Moss Humble Bee (*Bombus muscorum*).\*

the neuters, they are more ready to stand on the defensive. At most times the roof of the nest may even be raised and the structure examined without provoking the owners to use their stings, for stings they have, excepting the male humble bees. It must be confessed that in their economy they differ from the bee of our hives. Monarchical traditions have no hold upon these insects, for humble bees are strict republicans.

But as to their botanical labours? Without discussing here what is or is not the usual practice of other bees, we find three theories afloat anent the doings of the humble bees. Some say that they wander, led only by the impulse of the moment, from flower to flower; others, again, assert that in their excursions they confine themselves to one species, at least for each day; while a third belief is, that when collecting they visit plants of one family, or at least, if not quite so general as that, then those alike in appearance and odour, belonging to the same genus or to kindred genera. As bearing upon the subject, a statement has been quoted from old Samuel Purchas, who wrote upon bees in the days of Cromwell. He says, "Bees have this property, that whatsoever flower they first begin with when they go to work, they meddle with no other that journey, but lade themselves with such meat alone as that kind yieldeth.

female humble bee proves pugnacious and even spiteful.

The discrimination of the different bees commonly called humble bees (*Bombi*) is not an easy matter, and the separation of some of the species cannot be effected without examination by the microscope. In one species we often perceive a marked difference of size in the case of individuals of the same sex; but as a rule the females are largest, the males next in proportion, and the workers or neuters least of the three, averaging only half the size of the female. The insect known as the Carding or Moss Humble Bee (*B. muscorum*) has had its history ably described by Réaumur, his account being published by our Rennie, supplemented by his own observations, which are here, as usual, very truthful. These Carders, at the season they are most engaged in transporting moss to their nests, work in line, passing the materials along from one to the other, the last hauling each packet of moss, after it has been carded, into the nest. As the first in the line seizes the materials, cards them, and then passes the moss to the next, and each succeeding bee has only to push it by means of its legs towards the next, the work of the first is heaviest; probably it is relieved at intervals. This nest (*fig. 1*) is furnished with a dome of moss or dried plants, the base resting on the earth—only, however, upon a slight hollow, the cells not being entirely beneath the ground, as in the familiar *B. terrestris*.

\* From Figuier's "Insect World," published by Messrs. Cassell.

Returning to the subject of the early history of a colony. After the mother bee has, sometimes in a careless manner, formed several cells, and fed the young larvæ assiduously, after they have emerged, with honey and pollen until mature, she assists the young bees that are first ready to leave the pupa-case to free themselves from the envelope; and these lend their help to their brethren less forward. The neuters or workers that have thus emerged, though they construct new walls and cells, and also feed and nurture other brood, have an unfortunate fancy for eating the eggs—so it is asserted—which necessitates watchfulness on the part of the mother bee. The larvæ of humble bees are grub-like in appearance, white and plump, and of course quite unable to provide food for themselves; and it has been noticed that the males and females have a singular plan of helping-on the development of the pupæ by incubating the cocoons in which they are enclosed, and the elevation of temperature in that part of the nest is marked, according to Newport. The bees at first are soft, and tho down so moist that they cannot fly; in the course of two or three days they are ready to leave the nest.

Fig. 2.—Cells from a Humble Bee's Nest.

The number of occupants of a nest (*fig. 2*) varies. Perhaps the first brood of neuters may count forty or fifty. As many as three hundred have been supposed sometimes to be in one of these towards the close of a season. Mr. Smith found in August, in one instance, 107 males, 56 females, and 180 workers. A little difficulty in ascertaining is caused by the erratic habits of some, who are given to the dissipated practice of stopping out all night, reposing among the summer flowers. In the autumn the males are the first to die-off, the neuters and the bulk of the females following. It should be observed that in some of their cells these bees store-up pollen and honey, the cells being differently formed to the larval cells.

Humble bees, like others of their brethren, have many parasites, somewhat singular—not to speak of their personal enemy, a species of *Acarus*, *vulgo* mite, which attaches itself persistently to the plumage of the majority of them. What has been designated the Bastard Humble Bee (*Apathus vestalis*), dwells in the communities of the true humble bee, thriving there, seemingly without toiling for its subsistence. The insects nearly resemble each other, but the false humble bees have no neuters or workers. A species of solitary ant is one of the strange visitors in the humble bees' nests, the larvæ devouring that of the bee; yet it is allowed by the rightful owners to attain its full growth. A quadruped also, the field mouse, is a diligent destroyer of the combs and nests of humble bees, and a modern naturalist asserts that it checks the multiplication of the bees more than all other foes.—J. R. S. C.

### CINERARIA CULTURE.

This old and familiar friend is a general favourite, and welcomed alike by rich and poor, as it appears in early spring in great variety of colour when flowers are rather scarce. It is very useful for decorating conservatories, greenhouses, and cottage windows, and when well grown yields a great quantity of cut flowers. Like most other things it is easily grown when people know how to do it.

March, April, and June are the months in which the Cineraria naturally flowers, but by sowing seed at various times it may be had in bloom from the middle of August till the May of the following year. It likes a rich soil, firm potting, and plenty of pot room. In about two parts rotten sods and one part rotten dung, well mixed and broken, it grows fast and strong, and flowers abundantly. When leaf soil is used in the

mixture, or instead of dung, the plants grow too "leggy," losing their compact and beautiful form.

Let us at once notice the simple mode of propagating and growing the Cineraria. When the plants are done flowering, say in May, they should be cut-down level with the soil in the pots, and planted-out in a rich shaded corner of the garden, where they should be allowed to grow or spring-up like herbaceous plants. About July they will be ready to be propagated by slips, a great number of which may be taken from each stool or plant. A few rootlets may be seen growing from each slip. When the young roots are about the size of cat's teeth the slips should be taken off, potted singly in small pots, and placed in a shaded frame. I say singly, for if two or more off-shoots are potted together they seldom do well, but if potted singly they will soon fill their small pots and require larger ones. Let them have shifts into 5-inch and 7-inch pots as soon as needful; and about the end of September let them have their final shift into their flowering pots. If grown in a span-roofed house they should be placed near the glass on the north side of it, for Cinerarias do not thrive so well under the direct rays of the sun. Plants thus treated, and fairly dealt with in other respects, will be respectable specimens of good culture, commanding the attention of all who come near them.

Now for seedling Cinerarias: I have generally for out-door display sown seed at the beginning of February, and treated the seedlings like some kinds of bedding plants, for instance Lobelias; and I have frequently used Cinerarias and herbaceous Calceolarias as bedding plants. A bed of Cinerarias looks well for a short time, but unfortunately flowers of this plant out of doors run to seed very soon.

For autumn and winter-flowering plants I sow seed at the beginning of May, and grow the plants out of doors on the north side of a hedge or wall during the summer months.—A. PETTIGREW.

### THE ROYAL HORTICULTURAL SOCIETY.

WHAT is to be the upshot of all the agitation that is going on in the horticultural world, or rather amongst those connected with the Royal Horticultural Society?—a question that must be occurring to many besides myself, and one that requires careful consideration.

If we are to believe what report says, the Society is in a complication of difficulties of long standing, and there are evidently a variety of schemes afloat for setting it to rights, but without either unanimity of purpose or action. In fact, it would appear that there are a number of cliques, each agitating on its own account for something, and as regards several of them, it is by no means apparent what that something is. We are weekly made aware of the existence of Mr. G. F. Wilson's clique, proposing the reduction of the Fellows' subscription to a guinea as a certain restorative, also, I believe, advocating removal from South Kensington; but Mr. Wilson does not state where he would take the Society to. According to Mr. Wilson's statement there is a clique of "competent horticulturists in London engaged in the work of reconstruction." Reconstruction of what? for I am not aware that any London society has as yet actually fallen to pieces, therefore what does this reconstruction mean? Perhaps this clique meditates turning the present Council out in February, and the reconstruction means putting themselves in their places. If so, it would be well to know who these "competent horticulturists" are, and what their subsequent policy would be.

Then there is the vote-by-proxy clique, who, I believe, have requested the Council to summon a meeting of the Fellows. To do what? Why, "to make a bye-law to give the power of voting by proxy." Now, if I read the charter aright, the Fellows do not possess the power of making a bye-law at all; consequently the meeting will be a futile one, independent of the fact of a similar proposal having already been negatived once this year.

A clique of horticulturists which existed a short time since, called the "Horticultural Defence Committee," took upon themselves (in conjunction with another clique I believe) to go as a deputation to Her Majesty's Commissioners, at least so the Defence Committee's report stated; but query, did they not merely go to Her Majesty's Commissioners' office? However, be this as it may, what did they go to do? Nothing but mischief, for they possessed no power to make arrangements with Her Majesty's Commissioners, even if they met them; nor had they any authority from anyone to attempt to do so. In fact this movement on their part looked to me very like the

rank and file rushing over to the enemy's camp without either the presence or authority of an officer, simply to be caught in a snare prepared for them.

I read a proposal to build a club house at Chiswick for the convenience of the country gardeners, as a meeting place, &c. This seemed to be in connection with Mr. Wilson's guinea scheme.

Then there is what is called the Kensingtonian clique, a large and wealthy clique too, and one that contributes largely to the Society's funds, who, it is said, desire that the South Kensington gardens should be kept in first-rate order (at the Society's expense) for themselves and their friends to play croquet in, with frequent flower shows and band-playing for their own, their children's, and their nursemaids' amusement.

All these cliques are apparently pulling in different directions; the more they pull and waste their strength, or, in other words, the more they squabble and disgust the subscribing Fellows, and consequently fritter away the Society's means, the better, I guess, it will be liked by the mightiest clique of all—Her Majesty's Commissioners, who, under these circumstances, will have simply to bide their time and let these cliques go on fighting till, like the Kilkenny cats, there is nothing left but their tails; then they will be able to walk quietly in and swallow-up what little remains, and all the cliques had been fighting over.

This, I fear, will be the upshot of matters connected with the Royal Horticultural Society if we do not mind.

I am not aware if any of these cliques has consulted the Council, which is the only body possessing any power to make arrangements with Her Majesty's Commissioners, or anyone else. Whether this body is unanimous upon a policy or is also divided into cliques I know not; but it is whispered that they too, either in their corporate or individual (a mode of proceeding as ruinous as the Defence Committee's) capacity, or both, have in some way or other endeavoured to induce Her Majesty's Commissioners to come to some arrangement. If this be so, in which way, and with what objects in view, it is the duty of every Fellow to make himself acquainted, and the duty also, I take it, of the Council, in a business-like and straightforward manner, to inform us, and not to follow the example of the previous Council of trying to sell us, and then expecting us, without consideration, to vote upon the instant the confirmation of the warrant for our own execution.

If there are a few independent Fellows who take an interest in the Society's welfare, and who are desirous that it should be preserved intact, and that it should maintain the position which the Royal Horticultural Society of England ought to occupy; moreover, that it should be free to manage its own affairs, financial and otherwise—free, in fact, from all foreign control, and free to expend its income for the promotion of the science of horticulture—I say, if there are some who have not formed themselves into party cliques, but who are desirous of promoting these views, it is time that they should come forward and sign a requisition also, requesting the Council to call another meeting (or to arrange for the continuation of the one already called), not to consider an isolated question which can be brought to no issue, but to consider what can best be done to reinstate the Society in an independent and prosperous position; at the same time soliciting the Council to state plainly their views and policy, and to assist them in solving the problem.

I cannot bring myself to believe that Her Majesty and the Royal Family can really intend to desert the Society, the prosperity and maintenance of which at South Kensington formed a part of the late Prince Consort's scheme both for the promotion of the science of horticulture in conjunction with other sciences there, and for the adornment of the Kensington estate.

There can be no two opinions. I think, as regards the desirableness of coming to "satisfactory" arrangements with Her Majesty's Commissioners if possible; but what those arrangements should be requires mature consideration, and I maintain that the whole body of the Fellows should be consulted, and given ample time to consider. We must bear in mind that we possess for nineteen years the control of most valuable property—property, too, that Her Majesty's Commissioners want at once; in fact, had as our affairs are said to be, I believe we possess the means (if judiciously handled) of inducing Her Majesty's Commissioners to come to us (instead of our going to them), and with such an offer of terms that would enable the Society to maintain an honourable and independent position, and at South Kensington too. But if Her

Majesty's Commissioners will not meet us upon fair and honourable terms, then let us keep them out of every inch of ground that belongs to us, and make no temporary arrangements whatever with them.—JOHN DENNY, *Stoke Newington*.

P.S.—The word "clique" is intended to apply in its classical meaning, not in the now generally accepted one.—J. D.

As Mr. Wilson proposes to alter my letters I would ask him to be accurate when doing so. "The old Council was" not "caused to retire by a very small number of votes and those mostly local ones." The number on the last—i.e., the third—occasion of voting was nearly 450, besides which many, I should say one hundred, persons were present who did not vote on either side. Those who have been present at other elections will quite agree with me that at no previous occasion (except in 1861 when about one hundred votes were taken) had there been one-sixth of that number of votes. This remark applies to all the elections at which Mr. Wilson was placed on the Council. I see by a circular that I have just received that Mr. Bateman, and those who are in favour of the proposed proxy bye-law, consider three hundred votes quite sufficient to justify the introduction of that serious innovation. These are the only affirmative answers. How many negative answers they have received they carefully refrain from mentioning.

Persons pay rent when it becomes due, and not till then [see clause 11 Royal Horticultural Society's Charter, R. H. S. "Proceedings," June, 1861, page 531]. When the £2400 annual rent becomes due we may be sure the Commissioners will make the Royal Horticultural Society pay it.

The Commissioners of Woods and Forests are appointed by the Crown, so also are the Commissioners of 1851, and both are appointed for public purposes. The former by the terms of their appointment are bound to improve the pecuniary value of their trust, while the latter are under no such obligation. If, then, the former can and properly do give great pecuniary advantages to the Zoological and Botanic Societies, so the latter, by their agreements with the Royal Horticultural Society, do and properly ought to give the same to the latter Society. With regard to the one-guinea subscription the country Fellows might say, "We have no chance of enjoying the recreation portion of the gardens, so we will only pay one instead of two guineas." So Mr. Wilson must allow for one new guinea Fellow to make up for the amount he would lose by each diminished subscription. During the six years I lived entirely in the country I may safely say I could not have entered the gardens as many times for purposes of recreation. I am not a South Kensingtonian, but a staunch horticulturist. I oppose proxies because I have seen how, by artistically-drawn-up circulars which are to be signed "without delay," many are led to give their proxies, and have not the moral courage afterwards to withdraw them when they find how such documents have deceived them. I have seen the effect of proxies in large trading companies as well as in learned societies, and dread it equally in both.

Mr. Wilson thinks he can shift his responsibilities very easily on to the shoulders of his predecessors. To my mind the man (even if Mr. Wilson's assertions be accurate) who pursues and supports a ruinous course is as responsible for its disastrous effects as the man who initiates it.—A LIFE FELLOW, R. H. S.

#### AURICULAS—MR. TRAIL.

ANOTHER veteran florist is gone from amongst us, and in ranks that are thin such gaps fill slowly. Mr. Robert Trail, born near Montrose in 1796, died at his residence, Aberlady Lodge, Drem, early last November. He was one of the most enthusiastic members of the Edinburgh Botanical Society, sparing no pains to take part in its meetings and discussions. He also showed a very deep and lasting interest in the Infirmary and Lunatic Asylum at Montrose, acting as a director of these institutions for many years.

As a florist Mr. Trail was best known for his attachment to the Auricula, and his fair success with it. Contemporary with our sadly-missed friend the late George Lightbody, living to the same age, and for the same forty years working patiently like him at improving the beauties of a favorite flower, it will rightly be supposed that so long patience has had its reward. This has been so, and Mr. Trail, like his old friend George Lightbody, of Falkirk, has obtained honours in a difficult subject, leaving us some very beautiful varieties of the Auricula.

What a strange nature has this hardy little favourite! Not

that it is bad to grow, but because it has suffered no one man, as yet, to boast of many victories over its weak points and native imperfections. Lists of other cultivated flowers alter, oh, how quickly! A Rose election is necessary now and again to pick quality out of quantity. But the high blue-blooded *Auricula* is more than a queen in this. It knows little of such revolution and abundance. We have the belles of fifty seasons blooming by the side of *débutante* beauties and holding their own. But it is just a difficulty which gives zest to a pursuit and value to success. My favourite, the *Auricula*, is all the more to me for not being a facile flower on this point. With one surpassing triumph I should feel like the lioness in the fable, whom the dog with many whelps reproached for having but one cub. "True," said the royal mother, "but you forget that that one is a lion!"

Mr. Trail, like all true florists—and this is why florists' flowers thrive with florists only—always took the culture of his favourite flowers into his own hands. He was ever most generous with them, and would freely give young plants to all who would properly care for them. In the case of a valuable seedling this generosity sometimes comes back after many days. Mr. Trail knew the pleasure of occasionally receiving from friends again the seedlings of which he had himself lost all stock. He looked a very aged man when he came all the way from Edinburgh to Manchester for the last National *Auricula* Show, and told us how well the sight repaid him. He was glad to see how good some of his own seedlings could come—better than he had thought—and he brought pips of a few of his last to show us. We did hope once or more again to meet him thus, but he almost shook his head. He could not promise—and he was right.—F. D. HORNER, *Kirkby Malzeard, Ripon*.

### TRAINING POTTED CLIMBING PLANTS.

THE cheapest mode, as a correspondent, "CHELMSFORD," observes, is by the aid of sticks, and we prefer them painted

Fig. 1.

Fig. 2.

brown rather than green, the parts of them that are visible then look more like parts of the stem. But Mr. R. Read, many years since, suggested the mode very generally adopted, and represented in the following woodcuts. It is simple and convenient. The rods (fig. 2) and rings (seen in fig. 1) are made of strong galvanised wire; but they might also be made of wood with iron hooks. The hooks should be made to fit the ring exactly, and the rods can be made of any length, according to the nature of the plant they are meant for. Also, when necessary, they can be taken out of the pot, painted, and put together again with very little trouble.

**MUSHROOMS IN DECEMBER.**—One morning in the second week two men, named Mark Greenough and Edward Chew, found in fields at Low Moor, Bradford, Yorkshire, upwards of 2 lbs. of Mushrooms, the largest weighing nearly 17 ozs.

**STRAWBERRY COMTE DE ZANS.**—I have not seen the variety called *Comte de Zans* mentioned. This is a first-class variety, as productive as *Black Prince*, and in size of fruit like *Pre-*

sident. I first saw it at Darlington, and was much struck with its prolific character, a plant in a pot having been shown with about fifty large fruit. It seems to be a great favourite near Darlington. I find that it succeeds satisfactorily on this east coast, where several kinds never bear at all.—R. H. D.

### NOTES AND GLEANINGS.

SINCE the year 1871 a Japanese silkworm, the *YAMAMAYA*, which feeds on Oak leaves, has been in process of successful acclimatisation in Bavaria and Wurtemberg. The caterpillar is green, and about a finger's length; it appears in spring, and the moth lays its eggs in August. These pass the winter in the open air. The worms are generally kept in a well-ventilated room, and require little attention. This is the summer *Yamamaya*; but, as we learn from a German source, a different insect, the winter *Yamamaya*, has lately been introduced, and is likely to displace the former, inasmuch as it yields two generations each year—at the beginning and end of summer. The summer *Yamamaya* passes the winter only as an egg; the winter *Yamamaya* only as a cocoon. The summer *Yamamaya* lives as caterpillar, cocoon, and moth only in summer. About the end of April it leaves the egg as a caterpillar, and it dies as a moth about the end of August; its eggs giving the worms of the next year. The winter *Yamamaya*, on the other hand, passes both summer and winter as a cocoon, and the moth appears in April or May. The worms appear from its eggs in about a month; the spinning of the cocoon begins between the 7th and 27th of July, and the moth leaves the summer cocoon between the 5th and 28th of August. Though the winter *Yamamaya* appears as a worm later than the summer *Yamamaya*, it precedes the latter as a moth. The eggs which it now leaves produce worms in ten or twelve days; after fifty-two days these spin their cocoons in which the winter is passed. These cocoons bear a cold of 10° R. There are other advantages in using the winter *Yamamaya*; the spring worms appearing later than those of the summer *Yamamaya*, Oak leaves are more easily procured; the animal also eats more readily, spins a larger and better cocoon, and lays more eggs. The acclimatisation is now being prosecuted with vigour in Siebenbürgen and the south of Austria.—(*English Mechanic*.)

—VICE-CONSUL DUPUIS reports that the ROSE HARVEST of 1873 in the villayet of Adrianople has on the whole been remunerative to cultivators, and the crop is said to yield about 500,000 misicals, or about 93,750 ozs. of otto or attar of Roses, and is valued at about £70,000; but, owing to the moist weather, distillation was profuse, and the product is consequently less strong than in 1872. According to the degree of dryness of the season it takes from 8 to 9 okes (23 to 24 lbs.) to 14 to 16 okes (38 to 41 lbs.) of the blossoms to produce one misical of oil; and the price ranges, according to quality, from 14 to 18 piastres the misical, or from 13s. 1d. to 16s. 10d. per ounce. The mode adopted for testing the purity of the different qualities of these oils is to put the essence into flasks, which are afterwards immersed in water at a temperature of 63° to 68° Fahr.; if the quality be good, it will freeze, and this oil is preferred to all others as being of the purest kind. Some inferior oils will not freeze even at 52°. The oils from various soils differ greatly in quality; and manufacturers frequently adulterate the oils by an admixture of a substance produced by them from certain kinds of grasses. Otto of Roses is mostly exported from Adrianople to Germany; buyers from that country annually resort to Adrianople, and make purchases to the amount of about 62,000 ozs., the remainder finding ready markets in Constantinople and the East.

### ARUNDEL CASTLE.

THE SEAT OF THE DUKE OF NORFOLK.

THE Premier Duke, the Earl Marshal of England. These are high-sounding titles, and of long descent; but not less honourable is that of his eldest son, the Earl of Arundel, who is a peer of Parliament during his father's lifetime, so long as he holds the Keep of Arundel. We only know of one parallel case in the peerage. For years no notice has been taken of Arundel Castle gardens, and it is only now that, through the kindness of "A Visitor," we are enabled to present our readers with a few jottings of what is there to be seen. More than a quarter of a century ago he tells us he was there, and passed many a day in the beautifully-wooded park of between

1200 and 1300 acres, and in which is what is said to be the grave of Bevis of Hampton. We will, however, preface our correspondent's jottings with a brief outline of the history of the place.

A tradition of Sussex alleges that in the Bevis Tower of Arundel Castle resided the giant so named, that he had a weekly allowance of one ox, two hogsheds of beer, and corresponding quantities of bread and mustard. Moreover that his horse was named Hirondele, after which not only the castle was named but the whole district, now corrupted into Arundel. We are contented to believe that the name means the broad dell or valley along which the river Arun passes. Even in early Anglo-Saxon times it was a place of mark, for King Alfred devised to his nephew Anthelm the Manor of Arundel. In Domesday Book it is called "the castle of Harundel," and was given by William the Conqueror to his favourite military chief and relative Roger de Montgomery, but as he revolted and supported the king's rebel son this estate was forfeited to the Crown. Henry I. settled the estates and earldom on his second wife Alice of Lorraine who subsequently married William de Albini, and by marriage one of their descendants brought it to a Fitz Alan, who assumed the earldom "by tenure only." In 1579 it again passed by marriage to Howard, Duke of Norfolk. Philip, Earl of Arundel, his son, was attainted, and Queen Elizabeth seized the Honour of Arundel, but it was restored to his son in 1609, and has since remained the possession of the family.

During the parliamentary war the castle was battered down by Sir William Waller in 1643. Thomas, Duke of Norfolk, in 1716, added and fitted-up a brick building for temporary residence, but this was removed in 1796. In 1786 Charles, Duke of Norfolk, restored the Castle according to his own design. The square tower of the N.E. angle was begun in 1791, and the south front in 1795. The Great or Baron's Hall on the western side of the Court was begun in 1806, and connected with a chapel at the north end. The new gateway was begun in 1809. The Keep, a circular tower, and some of the walls of the ancient Castle remain. The Owls were kept in the Keep.

ALTHOUGH it is now upwards of twenty-five years since I visited Arundel, yet the little change which the town has undergone was to me striking; it seems to be at a standstill, notwithstanding that the railway has been brought nearer it, and the distance from London has been shortened from upwards of seventy to less than sixty miles. In the gardens, on the other hand, great alterations and improvements have been effected; trees have grown-up that were merely young plants, and the extent of glass has been largely increased.

From the commanding position of the castle, the pleasure grounds surrounding it present a great diversity of level, sometimes ascending to the Castle, at others overlooking the pasture land of the vale. By the side of one of the walks two noble specimens of *Cupressus macrocarpa*, which must be upwards of 35 feet high, form conspicuous objects, and near them is an Irish Yew 25 feet high, together with fine examples of *Thujaopsis borealis* and *dolabrata*, *Abies Smithiana* from 50 to 60 feet in height, and *Picea cephalonica*. A Cedar of Lebanon, stated to have been planted in 1830, has branched low down the stem, and covers a space 60 yards in circumference. *Paulownia imperialis*, besides its noble foliage, offers an additional attraction in its flowers, which are produced every year. Passing by a valley on the left, the banks of which bear a profusion of the common Hart's Tongue Fern, and are overhung with Yews and tall timber trees at the back, the flower garden is reached through a new gateway, close to which are the ruins of the old barbican. This garden, of which the accompanying is a representation, from a photograph by Mr. Russell, of Chichester, is of great extent, and when the bedding plants are in full bloom it must have a brilliant effect, especially when viewed from the Keep, to which the public are admitted on certain days. It is entirely within the ramparts, along which the Pampas Grass waves its silvery plumes, and the walls are partly clad with Ivy, while on other parts fruit trees are trained. The most conspicuous objects at present are the magnificent standard Portugal Laurels, several of them standing 12 feet high, and some fine Bays. The borders at the sides are filled with herbaceous plants; and as a proof of the mildness of the climate of Arundel, and of the mildness of the winter as well, it may be remarked that within a week of Christmas Veronicas and *Chrysanthemums*, also bedding Pansies, were in full bloom.

At one end of the flower garden is a Loquat tree, but this, though it flowered two years in succession, has not as yet fruited, even though one year it was covered with glass.

On passing-out of the flower garden on the opposite side, one finds oneself on the edge of a steep hill, commanding an extensive view over the Mid-Sussex Railway, with pasture land in the foreground, while at the foot of the hill is a kitchen garden of 4 acres, through which runs a stream, where Watercress is grown in abundance. From its low position I should conclude that spring frosts would be destructive here; and it is probably on that account that only the hardier kinds of vegetables are grown there. Along the edge of the hill a walk skirts the outside of the Castle. On the bank on one side a profusion of *Scelopendriums* and *Polystichums* delight the eye, while the steep declivity on the other is studded with Box, Yews, and Hollies, and nearer the base with lofty Oak, Ash, and Beech trees.

I next entered what is called the Castle Park, to distinguish it from the larger park. The sides of the boundary walks are planted with *Arancarias* and *Deodars*, the whole area being surrounded with *Laurustinus*, Hollies, and mixed shrubbery, with Lime, Thorns, Spruce, Elms, and Oaks in the background. I was much interested in some of the trees in this park, and for this reason—two of the Oaks planted by Her Majesty and the late Prince Consort in December, 1846, had been there only a few months at the time of my former visit, and slow-growing as the Oak is, they are now trees. That planted by the Prince Consort is much the finer tree, and one would suppose it to be a quicker-growing species. A *Cryptomeria*, planted by H.R.H. the late Duchess of Kent in 1848, is now a noble specimen; and a *Wellingtonia* planted Oct. 8th, 1858, long after my visit, I should judge at little less than 30 feet high. In this park there are two tanks, one to supply the town, and one for the Castle; but in the Great Park there are, besides, two large tanks as a reserve.

Next I will glance at the kitchen garden and forcing department, and before coming to the principal one, containing the glass structures, I will take the outlying portions. First there is an orchard of 5 acres, in which is also the frame ground, where Sea-kale, Rhubarb, Asparagus, Potatoes, &c., are extensively forced, whilst light after light was filled with Lettuces, as well as with Strawberries, in readiness for being forced. Passing through a tunnel under the London road, with the sides of the walk planted with Cedars, Yews, Aueubas, and other shrubs, we come to another large kitchen garden partly walled, and the walls planted with Peaches and Nectarines, Plums, and Cherries, and the borders with Apples and Pears, Gooseberries, and Currants. A considerable portion of the ground slopes southward, and is consequently well adapted for the production of early crops, and though the sea can be seen from the higher portion, the position is well sheltered by woods from the sweep of the winds.

Next comes the walled garden, in which are the forcing houses, having an area of some 5 acres. The principal walls surrounding it are 16 feet high, and provided with broad wooden copings; they are planted with Peaches, Apricots, Figs, Pears, Plums, and Cherries, according to aspect, and the borders with trees of the last three fruits and with Apples. Some queneuille-trained Pear trees 10 feet high are found very productive. Against the south wall is the old lean-to range, nearly in a line with the gardener's house, where, by the way, was a hedge of Roses in bud and bloom. It is upwards of 50 yards in length, about 18 feet wide, and is in three divisions, the first being a Peach house, and the other two vine-ries. The whole was undergoing repair preparatory for forcing, which, but for that circumstance, would have been commenced at an earlier period. There is an ample provision of shelves all round, as well as at top, for Strawberry-forcing and other purposes. On the wall at the west end of this range is a large old *Wistaria*, which extends 160 or 170 feet along the top of the west wall.

The Pine pits run parallel to the last-mentioned range, and are three-quarter-span, 48 yards long, and in three divisions, two of which are occupied by fruiting and the other by succession plants. The front sashes slide down, and the back lights are also moveable, pushing outwards. For bottom heat Oak leaves are employed. The varieties grown are the Smooth-leaved Cayenne, Charlotte Rothschild, Black Antigua, Black Jamaica, Moscow Queen, and a few Montserrat. Several fruit ripe and ripening were large and handsome. Shelves at the back and in front are utilised for Strawberry-forcing, &c.

Next comes a fine new range consisting of two iron lean-to

ALTON CASTLE—THE KEEP AND FLOWER GARDEN.

houses about 15 feet high at back, and 20 or 21 feet wide, each 19 yards long. It is worthy of note that the glazing-bars are of copper, which, though very enduring, must have entailed a heavy expense at first. There is a broad flagged pathway at back, and in each house there is a deep tank in which the rain water is collected. These spacious structures are used as vineries; and a corresponding pair of similar dimensions are used as Peach houses. In one the Peaches are trained in the ordinary way on a trellis near the glass, but in the other they are planted-out in the border orchard-house fashion, and trained with umbrella heads; on the back wall in the one case are Figs, in the other Peaches and Nectarines. There are, in addition, two fine span-roofed houses running north and south, 24 feet wide and about 70 feet long. One of these is a vinery, planted with Black and white Muscat of Alexandria, White Nee, Lady Downe's, Black Damasens, and some other varieties, but the greater part of the crop had been cut; the other is a Peach house planted with umbrella-trained trees, with, in addition, some Plums and Cherries.

I will pass over the remainder of the glass, which comprises a number of heated pits in which bedding plants, and *Dracenas* and other fine-foliated plants are grown for house decoration; for Arundel is a fruit-growing, not a plant-growing place, and in the days of McEwan its victories were numerous in the "tented field" of Chiswick, as well as at the Regent's Park.

I have to apologise for the imperfect notes which I place at your disposal, for my run through the place was rapid, and the time of year one of the least favourable that could have been chosen for such a purpose; at the same time, in concluding, allow me to place on record the order and cleanliness in which the grounds are kept.—VISITOR.

### GARLANDS.

THE use of garlands both at weddings and funerals is of great antiquity. According to Pliny, however, flowers were not used in garlands till about the year 380 B.C. Before this date they were composed exclusively of branches of trees or green herbs. He relates that the painter Pausias being in love with the garland-maker Glycera, first caused flowers to be combined with the green. These two, the one working in the materials nature gave to her hand, the other imitating them on his canvas, vied with each other in the novelty and taste of their designs, and thus introduced the fashion. Among the Greeks, Roses, Violets, and Myrtle appear to have been the favourite flowers for garlands. The first, sacred to the Graces, as well as to the god of silence, the second believed to have health-restoring powers, and the third dedicated to Venus, whose altar was decorated with wreaths of Myrtle. By the laws of the twelve tables, those were crowned with garlands when dead, who in life had merited the honour. The public games had each a distinctive crown, and not only had the victors their temples wreathed with Parsley, Fennel, or other herbs, but, according to Pliny, a like token of respect was granted to their parents. Amongst the Romans the same custom prevailed; and a civic crown of Oak leaves was the reward of him who had saved the life of a Roman citizen. A Roman bride wore a chaplet of flowers and herbs upon her head, and a girdle of wool about her waist, and at funeral feasts the mourners wore garlands while celebrating the virtues and achievements of the dead.

When paganism retired before the advance of Christianity, all ancient customs were not abolished; and the beautiful and significant use of herbs and flowers at weddings and funerals was still retained. In Cole's "Art of Simpling" he thus speaks of garlands formed of the Cypress, Rosemary, and Bay. "They are all plants which fade not a good while after they are gathered and used—as I conceive—to intimate unto us, that the remembrance of the present solemnity might not die presently, but be kept in mind for many years." Flowers, on the contrary, were used as emblematic of the shortness of life. Amongst the Anglo-Saxons, flowers appeared both at their bridal and burial feasts. After the "benediction ceremony," as Strutt calls it, the bride and bridegroom were crowned. But as these garlands were kept in the church on purpose, they must of course have been composed of artificial flowers. That bridal chaplets continued to be worn, contemporary writers bear witness. Chaucer takes care not to omit the garland in describing Griselde adorned for her marriage. In the fifteenth century brides wore garlands either of flowers or corn ears.

The poets and authors of the sixteenth and seventeenth centuries abound with references to plants and flowers as used both in bridal and funeral ceremonies. At this period, trees,

herbs, and flowers had a clearly defined significance. Cypress and Yew were emblematic of death and immortality; Rue was the "herb o' grace;" Rosemary was for remembrance, and is mentioned by several old herbalists as good for strengthening the memory. Violets symbolised fidelity, the Columbine desertion, and the Willow has been from time immemorial the tree of mourning, especially devoted to forsaken lovers. These sweet old superstitions have disappeared before the light of reason. We no longer believe in the signatures of plants, and their consequent efficacy, but the familiar flowers of our poets still speak to us in a language we feel, while the grander exotics are dumb. Strutt gives a detailed description of a wedding procession in the time of Queen Elizabeth. The author is speaking of the marriage of his hero. "The bride being attired in a gown of sheep's russet, and a kirtle of fine worsted, her head attired with a billiment of gold, and her hair as yellow as gold hanging down behind her, which was curiously combed and pleated, according to the manner of these days; she was led to church between two sweet boys, with bride laces, and Rosemary tied about their silken sleeves. Then was there a fair bride cup, of silver gilt, carried before her, wherein was a goodly branch of Rosemary gilded very fair, and hung about with silken ribbons of all colours; next there was a noise of musicians, that played all the way before her. After her came the chiefest maidens of the country, some bearing bride cakes, and some garlands made of wheat finely gilded, and so passed to the church; and the bridegroom finely apparelled, with the young men followed close behind." By this it would seem that the emblematic garlands were carried by the bridesmaids, and that the bride wore instead an ornament of gold.

At the end of the seventeenth or beginning of the eighteenth century, garlands were still borne at funerals, though they were then mostly composed of artificial flowers, with a mixture of gold and silver tinsel, silk, dyed horn, and other tawdry additions. In the centre of these crowns or garlands hung a piece of white paper shaped in the form of a glove, on which the name and age of the deceased were inscribed. In Yorkshire and other parts of England the custom of hanging up garlands of cut white paper over the seat that a "virgin dead" had once occupied in church, prevailed to a late date. At the present time in various parts of Germany and northern Europe, a maiden when laid in her coffin is crowned with a Myrtle wreath. In the south also the bodies of young girls and children are crowned, but generally with artificial flowers, too often of a tawdry kind. The wreaths of *Immortelles* on the tombs abroad, particularly in France, are familiar to everyone. It is a touching spectacle to see whole families loaded with flowers and garlands, trooping to the cemeteries on All Souls' Day, to deposit their tribute of love at the graves of the departed. In *Père-la-Chaise*, the tomb of Abelard and Heloise used to be pointed out, the effigies almost concealed by wreaths of *Immortelles* placed there by *les amoureux infortunés*, it was said.

To revert to the brighter side of the subject, garlands have continued to constitute an essential part of bridal array in all countries, though the flowers selected for this purpose vary. In Normandy Roses find favour. When a man has little or no dowry to give his daughter, it is a saying there, that he will give her a chaplet of Roses. In Italy the Jasmine is the flower selected. In Germany the Myrtle wreath prevails, as in the classic days of Greece and Rome. It is a frequent practice for a young girl to plant a Myrtle, and to watch and tend it till the time arrives when she requires the delicate blossoms for a bridal wreath. Should she die unmarried, the same Myrtle furnishes her *Todtenkranz*. It is considered extremely unlucky to present another with Myrtle from a plant dedicated to one alone, either for life or death. The Myrtle crown of the bride is frequently alluded to by German poets. In the northern provinces of Germany, and in Scandinavia, the bridal crowns are composed of artificial Myrtle, ornamented in a manner more showy than tasteful, with additional flowers in gold and silver. These crowns are often a foot or more in height. In the evening the garlands are *abgetanzt*, danced off; a lively tune strikes up, and the bridesmaids and other girls dance round the bride, who is blindfolded. Suddenly the music stops, when the bride places the crown on the head of the girl who happens to stand before her at the moment. Of course the maiden thus crowned will be the next to be married.—(Argosy.)

### NOTES ON VILLA AND SUBURBAN GARDENING.

Look over window plants in pots carefully, and with a soft sponge or piece of cloth and some clean, soft, milk-warm water

wipe the dust from every leaf. Small-leaved plants, such as Myrtles, may be more speedily cleansed by dipping their heads in a tub of water, and whisking them several times through the water. The health of plants to a very great extent depends on the pores of the leaves being free from dust. What the lungs are to the animal the leaves are to the plant. Any that are infested with green fly should be put into a large tub or box and fumigated gently with tobacco smoke two days in succession, giving them about an hour and a half each time. Keep the surface of the soil in the pots open, and the pots clean. Beware of overwatering Geraniums, and, in fact, all plants at this dull season. One of the very best window plants is the old neglected Lily of the Nile, *Calla aethiopica*. Another first-rate and easily-managed plant is *Dielytra spectabilis*. When it has done flowering it should be placed-out in a light rich soil, be lifted and potted in September, and when the foliage has decayed put it in any cool place till it begins to grow, when it may be transferred again to the window.

The amateur who possesses a greenhouse should towards the end of the month shift Geraniums that are well rooted, using a rather heavy and rich soil, potting and keeping the plants well tied and near the glass. See that *Camellias* are never allowed to get dry at the roots, otherwise you may lose your buds; and do not expose them at any time to cutting currents of air. *Calceolarias* that are well-rooted in small pots should have more pot-room. A soil of half loam and well-decayed dung or leaf mould, with a little sand, suits them well. Keep *Verbenas*, *Scarlet Geraniums*, and other bedding plants free from dead leaves. If you have Vines in your house and they are not yet pruned, lose no time in getting it done. Little can be done out of doors at present beyond the collection of manure. Road-scrappings and turf-parings are excellent for mixing with your pig manure, and these, well saturated with soap-suds and other fertilising liquids, will make a famous dressing for your garden in spring. Where the ground has been previously rough-dug or ridged, fork it over on frosty mornings, so that the frost may penetrate and pulverise the soil to a greater depth. As we may yet expect to have some severe weather, any plants, such as *China Roses*, that are rather tender should be protected, for having been somewhat excited by the late fine weather, frost will have more effect upon them and might prove very injurious. Any hardy climbers on walls, as *Clematis*, &c., if not previously done, may now be neatly trained.

**VEGETABLES.**—Marshall's Dwarf Prolific and Mazagan Beans are the kinds generally used for early crops. The latter is the hardier; and if not done before this, some may be sown for an early crop as soon as the weather will allow, in shallow drills about 18 inches apart. On a warm border they may be planted in the row about 3 inches apart, and covered about 2 inches deep. On the first fine day a sowing of Dillistone's Early or Sangster's No. 1 Peas may be made on a warm sheltered border, which should have been ridged crosswise. Draw the drills within 3 inches of the bottom on the south side of the ridge; this will keep the seeds dry and prevent them from rotting, as sometimes happens, especially in a retentive or clayey soil. For this crop the seeds should be sown pretty thickly, and in case of intense frost they should be protected by fern or furze. Some of the latter chopped may be put in the drills to prevent the ravages of mice.

**FRUIT.**—Any fruit trees trained against a wall may now be pruned, have their shoots rained quite straight, and disposed so as to cover the wall equally. Standards may also now be pruned, taking care to cut-out all cross branches. Gooseberries and Currants, if not previously pruned, may now be gone over, so as to allow the ground to be dug between them.

**FLOWERS.**—If any bulbs, such as Daffodils, Anemones, or Tulips, are not already planted, the earliest opportunity should be embraced for getting them in. Those planted in October will now be above ground; they should be covered with fern to keep them from frost. Every unsightly object should be removed from the flower borders, so as to give them a neat appearance.

**WINDOW PLANTS.**—Spring and autumn are the times of the year at which window plants require the greatest attention. It is usual to have the plants outside the windows even during the night in the summer season, and kept in the house both night and day during the winter. In the intermediate seasons of spring and autumn the plants are frequently placed in their summer positions during the day, and it is desirable that they should be placed in their winter situations during the night. Our climate is so variable at those seasons that we not only have summer during the day, and winter during the night, but whole days of summer and winter alternating with each other. Sometimes we have warmer days in April than in May or June, and occasionally we have more severe frosts at the beginning of September than any which occur again till November is nearly over. Now, it is not the absolute heat or cold, but the rapidity of the transition from the one to the other, which is injurious to plants, and therefore it is absolutely necessary for all such as have their house plants in the perfection of beauty, to attend to those circumstances. This is more especially necessary in towns

where people are much less interested in the changes of the weather, and therefore much less observant of them, than they are in the country; and I have no doubt more plants are destroyed from want of attention in those variable periods of the year than from any other cause. It is a safe rule to trust no plant less hardy than a common Geranium outside the window all night earlier than about the 20th of June, or later than the 1st of September. No doubt there are many nights before the first of these times, and after the latter, during which the plants might remain in the open air without injury. There is, however, no knowing what a night may bring forth at those inconstant seasons, and therefore the safe plan is not to leave the plants to chance.—W. KEANE.

## DOINGS OF THE LAST AND PRESENT WEEK.

### KITCHEN GARDEN.

The weather still continues favourable for all out-of-doors operations. The thermometer has fallen to the freezing point once or twice during the week, but the days have been mild. Much of our time has been taken up with wall-nailing and pruning the pyramid and other fruit trees on borders specially devoted to their culture. As they have been under summer pruning, all that is required at this season is to thin-out the branches where they are overcrowded.

We had a very heavy crop of fruit last season. Apples were most abundant, nor has the fruit ever kept better than it has done this year. The fruit-room faces south, and being an upper storey is rather dry, so that where the fruit had not been quite ripe when gathered it has shrivelled a little. Of course there are some varieties of Apples which shrivel more readily than others; for instance, the true old Golden Pippin will keep in good condition longer than the Pitmaston Golden. Ribston and King of the Pippins do not become soft even under unfavourable conditions. Cox's Orange Pippin will keep a very long time, but if the fruit is not quite ripe when picked it also becomes soft. When it is desirable to preserve a quantity in good condition, and the fruit-room is not well adapted for them, it is a good plan to wrap each fruit separately in a piece of soft paper, placing a layer of fruit in the bottom of a box or barrel; this layer is then covered over with dry sand, then another layer of fruit, which is covered with sand in the same way, and so on until the box or barrel is filled. It is not necessary to look over the fruit very often, as should any of the specimens decay the sand will, to a considerable extent, prevent the mould from spreading.

All the trees are well furnished with buds, but we do not expect those that were overcropped to bear another full crop next season. The borders are being dressed with rotted frame manure, and will be dug over with a fork just deeply enough to break-up the surface. Some persons recommend the borders not to be disturbed by fork or spade. We fancy digging lightly is beneficial to the trees: the borders have a tidy appearance after being dug, and the hoe can be more readily worked when weeds appear.

It is highly desirable to stir the ground amongst all green crops with the hoe, not so much to destroy weeds as to aerate the ground.

Lettuce planted in cold frames, and which is now ready for use, should be kept free from decaying mouldy leaves, and have the lights removed whenever the weather is mild, shutting-up closely at night. Made a sowing of early Peas on Dec. 23rd, the ground in splendid order. Our two favourite sorts are Alpha and Taber's Perfection [Sangster's No. 1], to which are added this year William I. and Blue Peter; both were grown last year for the first time. The last-named is the best dwarf Blue Pea, and William I. will displace all the other early Peas for exhibition purposes. The haulm is generally thin at the bottom, and as an experiment equal quantities of seed of Blue Peter and William I. were mixed together; the dwarf sort will fill-up the bottom part and thus utilise space.

### FRUIT AND FORCING HOUSES.

*Pines* may now have a higher night temperature—65° as a minimum, with a bottom heat of 85°. As the temperature is increased a little more atmospheric moisture will be beneficial to the plants, but no water should be put in the evaporating-troughs as yet. We find it necessary to examine carefully all plants that are throwing-up fruit, and to ascertain the state of the roots; if the soil is very dry it is best to thoroughly saturate it with water, and not to give any more until the soil is again comparatively dry.

*Cucumber houses* require a good deal of attention at present. The night temperature ought not to fall below 65° even in cold nights after this time. Thrips and green fly are troublesome, but tobacco smoke applied on three successive evenings soon clears the plants of them. The leaves being tender at this season, it is better to smoke oftener than to run the risk of destroying them. The pipes in our houses are well supplied with evaporating troughs, but experience has taught us that too much vapour is injurious, it causes the foliage to be wanting in sub-

stance and unhealthy. During the late spring and summer months the troughs may always be supplied with water.

**Mushroom beds** should be in full bearing now, and to keep-up a supply other beds should be in progress. We fancy the best Mushrooms are produced when, say, a fourth part of cow manure is added to that from the stables. It should be thrown together and allowed to heat until the rank steam is thrown off. The manure must be sheltered from the rains, which at this season would be injurious. If it should become too wet it will be improved by being spread-out about 9 inches deep on the floor of an open shed before throwing it up in a heap. The manure ought to be moderately moist at the time the bed is made-up, and should be rammed down quite firmly, which prevents over-heating. The spawn may be inserted when it is found the temperature of the bed will not exceed 85° or 90°. It is not desirable to water the bed until the Mushrooms appear, when a moderate watering of tepid water should be applied. In all cases 2 inches of maiden loam should be placed over the surface of the bed and beaten down firmly with the back of a spade. Fifty-five degrees is the best temperature at which the house should be maintained.

**Dwarf Kidney Beans** in pots where the temperature is 65°, unless due precautions are taken, will become infested with red spider. To keep this pest in check syringe the under sides of the leaves every morning, and do not allow the soil in the pots to become dry.

**Asparagus Forcing.**—Where there are heated pits no difficulty should be experienced in keeping-up a supply of this vegetable. Shallow beds with two or three rows of pipes for hot water in the bottom are well adapted to maintain the temperature of the beds; about 18 inches of stable manure and leaves should be placed over the pipes, and when the heat has declined to 85°, the clumps of Asparagus roots should be planted on the bed. The temperature of the house may be 50° at first, rising, as the crowns show signs of moving, to a minimum of 60°.

When dung beds are used for forcing this vegetable there is always much danger of the roots being damaged by too much heat; and when the first heat declines applying linings of fermenting manure often involves considerable labour.

#### STOVE AND GREENHOUSE.

**Stove.**—There is now a paucity of flowers. Bouvardias of sorts are invaluable for cutting; they require a cool stove. If the plants are removed to a greenhouse when in flower, they must not remain there too long, as the young branches die-off with the cold. *Urceolina aurea* is a very distinct stove plant; its clusters of drooping yellow flowers are very ornamental, and the effect is much enhanced if they are grouped with specimens of *Aphelandras*. But perhaps the most useful of all winter-flowering plants is *Dendrobium nobile*. A set of plants of this are kept in a cool house—a lateinery where the atmosphere is dry suits them best—and at intervals of two weeks remove a few plants to the stove, and in this way a succession of bloom may be kept up from December until June.

**Greenhouse.**—The most valuable subjects at present are the different varieties of the Camellia; the large handsome flowers of different shades standing out against the bold glossy dark green foliage cannot be surpassed. When cultivated in pots there is always danger of the plants becoming unhealthy, or the complaint is made that the buds drop-off. The most frequent causes of these evils are over-dryness at the roots or in the atmosphere of the house, or stagnant water at the base of the roots, caused by the drainage being choked. The fleshy roots of the Camellia are easily injured, and the first signs of anything being wrong is the flower-buds dropping off. If any of the plants are infested with scale the leaves will be dirty; they should then be washed with soap and water.

Epacris and the winter-flowering species of Cape Heaths are very valuable for cutting; they require to be well attended to as regards the root-supply of water, the ball should be thoroughly moistened when water is required. Sometimes a plant standing near a flue or hot-water pipes will be over-dry, and the ball will part from the sides of the pot; when this is the case the ball should be rammed-in rather firmly, and the pot soaked in water for half an hour.

Specimen plants of Stage and Fancy Pelargoniums must now have the shoots trained regularly over the plant; those intended to flower late should be stopped. Smoke the house if only one green fly is to be seen, water cautiously at the roots. The variegated section require very little water during the present month. Allusion has lately been made to the mould or damp on Chinese Primulas. Ours are very badly affected. The only way to save the plant is to remove the fungoid growth with the fingers, and apply fresh-slaked lime to the injured part. Prompt action is necessary.

#### FLOWER GARDEN AND SHRUBBERY.

No better weather could be desired to forward all operations in this department. All shrubs, especially evergreens, should have been planted by this time. If any work of this sort remains yet to be done no delay should be made. It is highly desirable that the plants be established before frosts come. A

mulching of rotted manure over the roots is of much use in warding-off frosts. Roses ought also to be planted-out before the new year comes in.—J. DOUGLAS.

#### TRADE CATALOGUES RECEIVED.

J. Hill, Spot Acre, Stone, Staffordshire.—*Catalogue of Forest Trees, Shrubs, Roses, Fruit Trees, &c.*

J. Carter & Co., 237 and 238, High Holborn, London.—*Carter's Vade-Mecum*, 1874.

#### TO CORRESPONDENTS.

\* \* \* We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed *solely* to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

BOOKS (B. W.).—If you need only the names and short descriptions of plants and the orders they belong to, Loudon's "Hortus Britannicus" will suit you.

SUPPLEMENT (F. H. K.).—When we give extra pages we call it a supplement. You have mentioned goldfinches and bullfinches, but have not finished your query.

ENCROACHING TREES (Welby).—The courteous mode of proceeding is to ask your neighbour to lop-off the branches overhanging your garden. If he refuse to do so, you may lop them. As to the roots, you may cut them off as far as they penetrate your soil, but no further.

CLIMBERS FOR VARIOUS PURPOSES (Rose).—The *Bougainvilleas* will do in a winter temperature of 45°, or occasionally 40°, if kept dry at the roots. Climbers for covering the chains which support a 40-foot pole are *Jasminum nudiflorum*, *Caprifolium Perelymonum*, *Clematis Vitalba*, and climbing *Roses* *Dunee Rumbler*, *Amadis*, and *Rampante*. Some of the best *Clematises* are *Alexandra*, *Henryi*, *languinosa nivea*, *Lucie Lemoine*, *Mrs. James Bateman*, *Star of India*, *Jackmanni*, and *rubro-violacea*. A few climbers for a greenhouse—*Bignonia jasminoides splendens*, *Kennedyi himalaica variegata*, *K. inophylla floribunda*, *K. Marryatiae*, *Lapageria rosea*, *Mandevilla suaveolens*, *Passiflora Countess Nesselrode*, *Rhynechospermum jasminoides*, *Jasminum grandiflorum*, *Tacsonia Van-Volckemi*, *Hoya carnea*, and *Sollya linearis*. A few climbers for a hothouse or stove—*Allamanda cathartica*, *A. Hendersonii*, *Cissus discolor*, *Clerodendron Balfourii*, *Dipladenia crassinoda magnifica*, *Ipomoea Horsfallii*, *Passiflora Decaisneana*, *P. princeps*, and *Stephanotis floribunda*. Flowering stove plants—*Anthurium Scherzerianum*, *Aphelandra aurantiaca Roezli*, *Burchellia capensis*, *Centropogon Laccanensis*, *Dalechampia Roezliana rosea*, *Eranthemum pulchellum*, *Encharis amanoensis*, *Franciscia calycina major*, *Gardenia radicans major*, *Ixora acuminata*, *I. coccinea superba*, *Lasiandra macrantha floribunda*, *Medinilla magnifica*, *Pentas carnea*, *Rondeletia speciosa major*, *Thysanctanthus rutifolius*, *Euphorbia jacquiniiflora*, and *Poinsettia pulcherrima*.

TREES AND SHRUBS FOR EXPOSED POSITION (E. M. P.).—The best trees for an exposed position are the Sycamore, and the Corsican and Austrian Pine, Mountain Ash, Bird Cherry (*Cerasus Padus*), and common Elder. With these as nurses or as a screen you may so break the violence of the winds from the west as to grow to the east of them, and under the shelter of the above, a great variety of shrubs; but in the absence of particulars we are unable to advise.

CHRYSANTHEMUMS AFTER FLOWERING (Idem).—Cut away all the old shoots close to the ground, and take the cuttings when 3 or 4 inches long, and pot them singly in small pots, and keep them in a cool house until rooted, and then remove them to a cold frame until April, when they may be shifted into larger pots, and in May may be placed out of doors in an open sunny spot.

CAMELLIAS FOR COOL HOUSES (F. T., Dublin).—The lean-to houses which you propose to construct against your existing houses, and which when finished will have north-in aspects, will not, if unheated, be suitable for Camellias, but if heated they would answer admirably. Without heat we fear you would not be able to give the needed stimulus for a good growth and thorough ripening of the wood. On the front stages of such a house you would be able to grow Azaleas and a majority of greenhouse foliage plants. Unheated, your houses would suit the hardy kinds of Ferns, which in their multitudinous forms are very fine. If you cannot heat the proposed structures, any unsightliness of the walls might be overcome by covering them with Ivy.

PRUNING PYRAMID PEAR AND APPLE TREES (E.).—The "lateral fine spray growing out of the various main branches and leaders" should be cut back to two eyes, and the shoots produced in consequence next season should be stopped at the third leaf, and afterwards to one leaf, unless they are wanted for extension; then they should be allowed to make six or more leaves before being stopped, stopping again at the third leaf. Had the shoots been stopped to three leaves they would not now have needed cutting-back. Pinch them well in summer, and little or no winter pruning will be necessary.

ARRANGING STAGING OF GREENHOUSE (M. B.).—Your house being a lean-to 5 feet wide, with a Peach tree against the back wall, you will only be able to have staging in front of the house, and that, to do justice to the Peach tree, should not be more than 2 feet 6 inches wide, and flat. There may also be at the back of the house a shelf about 1 foot 9 inches wide, 2 feet 3 inches or so from the floor, formed of laths, so that it can be removed as required for top-dressing the soil about the Peach tree. The plants on the stage should

not be large, or they will shade the lower part of the back wall, and the Peach tree will not thrive.

**DESTROYING SLUGS (H. K. J.).**—One remedy would be to take off the surface and burn it, as doing so would destroy not only the slugs but their eggs. Unless the land is strong we do not advise this, as we find that repeated applications of lime, fresh or newly slaked, are a perfect cure. It should be applied at the end of the day or early in the morning, making the ground quite white, and repeat the application every week or ten days, and best after rain. The ground, between the dressings, ought to be stirred with a hoe or fork. Your case being a bad one, we advise sowing the flower as well as kitchen garden with salt in March, evenly broadcast at the rate of twenty bushels per acre, following with the lime as may be requisite.

**PLANTS UNDER TREES (G. C.).**—As you wish for a few Ferns, we may say that it is only the commoner kinds that will succeed, and those not well unless the soil is moist. The most suitable Ferns are *Lastræa Filix-mas*, *Athyrium Filix-femina*, *Lastræa dilatata*, *Blachium Spicatum*, *Polystichum aculeatum*, *Scopolopodium vulgare*, and *Polypodium vulgare*. Other plants are *Hypericum calycinum*, *Periwinkles* of sorts, *Primroses*, *Lily of the Valley* in places not densely shaded, also *Violets*, *Snowdrops*, *Winter Aconites*; and shrubs, such as *common Laurel*, *Tree Bor.*, *Anchusa*, *Mahonia* or *Berberis Aquifolium* and *repenus*, *Butcher's Broom*, *Laurustinus*, *Holly*, and *Ivy*, which are probably the finest of all subjects for growing under trees.

**WINTER DRESSING FOR FRUIT TREES (Idem).**—The object being to destroy vermin, use paraffin oil mixed with an equal proportion of soft-soap solution, 4 ozs. to the gallon of water, and apply it from the fall of the leaf until the buds begin to swell in mild weather. It must not be applied after the buds have swelled. They may be dressed with 8 ozs. of soft soap to a gallon of tobacco juice, the juice being heated to 160°, and the soft soap thoroughly dissolved, applying it at a temperature of not less than 90°, nor exceeding 140°.

**CASE FOR TRICHOMANES (S. A. B.).**—The case should be lined with zinc, and not only that, but have a loose or false bottom of perforated zinc, which should be placed 1 inch above the bottom, and the latter should have a small pipe and thumb-screw, so that water draining from the soil may be removed at pleasure. The sides, ends, and top of the case should be of glass, and the ends should open. The drainage should be placed on the perforated zinc, and consist of an inch or two thick of pieces of stone, and over it some rough pieces of peat should be laid to keep it from choking. Use from 4 to 6 inches of soil, but 3 will suffice; it should consist of fibrous, spongy, brown peat, and a third of freestone or sandstone, with a little silver sand, placing pieces of sandstone on the surface. The plants should be planted rather high, and the interior of the case must always be moist. If they have enough the fronds will have dew-like drops on the fronds every morning.

**SEA SAND FOR STORING BEET—HEAT FROM LEAVES AND DUNG—CLEANING VINERY (C. S.).**—Sea sand answers for the storing of Beet, Parsnips, and Artichokes, but it should be dry, and is then as good as, or better than, pit sand. The heat of a well-made hotbed of leaves and dung will endure a considerable time, but is liable to diminution of temperature after it has been made from a month to six weeks, it being necessary to renew the heat by linings—that is, when a uniform and continued temperature is required, as in growing Cucumbers or Melons. It will answer without linings for raising plants from cuttings or seeds; but if to be used continuously for that purpose, the heat will need to be renewed by linings. All the woodwork of a vinery ought to be washed with soap and water, and the glass with clear water, for which the garden engine is very suitable, but the dirt on the glass will need to be dislodged by a brush or sponge, and then driven off with water from the engine.

**CAMELLIAS MILDEWED (Constant Subscriber).**—No wonder your plants are mildewed when, as you say, the leaves are seldom dry. The low situation and surroundings of the house are such as are favourable to fungi; but could you not have gentle fires, so as to render the house drier, air being given freely? If the plants are very close together the distance should be increased, and the moisture may be kept under by admitting air more freely, leaving a little on at night; but gentle fires will be necessary to secure the required temperature, and in dull periods to promote a circulation of air. With this we do not think you will have mildew. It may be destroyed by dusting with flowers of sulphur, through a muslin bag or old stocking, the parts which are attacked.

**WEIGHT OBTAINABLE OF EARLY GRAPES (An Old Soldier).**—An ordinary greenhouse, 12 feet by 16, only heated sufficiently to preserve plants in winter, will not produce Grapes early, but now and then good Grapes which might ripen about August are obtained. Allowing, therefore, that plants are cultivated in the house, which necessitates a portion of the glass being kept clear of foliage, you might, perhaps, produce from 80 to 100 lbs., but it is difficult to say with anything like certainty what ought to be grown in such a position; so much depends on the management. If, however, your purpose is to compete in the market with others, we would not advise you to attempt to ripen your Grapes too early unless the heating apparatus, the situation, and other conditions are favourable. The attention required, as well as the price of coals, will leave you but a poor chance to compete with the professional grower, who has large houses contrived expressly for early forcing.

**FERTILISING SANDY SOIL WITH LIQUID MANURE (An Old Soldier).**—Soil of the description you name is the most benefited by liquid manure. Some years ago a friend occupying a plot of such land on the top of a hill, and which under ordinary treatment produced scarcely anything, by dint of deep cultivation and the free application of manure, both solid and liquid, contrived to have for his horses some of the heaviest crops of Lucerne, Clover, Ryegrass, and other green foods which we have seen. Much the same may be done for cows, but we would not advise you to give the cows Cabbages, as they taint the milk, and it is now too late to sow or plant anything likely to be of use in the spring, unless it be Cabbages. We would therefore recommend the ground to be deeply cultivated, taking care if the surface soil is shallow to keep it still to the top, but disturbing the subsoil as much as possible to allow of deep-rooted plants, like those mentioned, descending in search of food. You might try a small portion of it in grass, but unless well watered it does not do well on dry soils. Better try the Vetches, Saintfoin, Tares, Clover, &c., which all withstand dry weather better.

**GLASS HOUSE FOR VINES AND BEDDING PLANTS (A Constant Reader).**—Your plan cannot well be improved, unless it be by the addition of T iron-bars as supports to the glazing-bar between the principal rafters, which would otherwise sag in if of greater length than 6 feet. Your plan of ventilation at top by glass is also good, but we would adopt a somewhat different arrangement in front, and have the pillars immediately underneath where the rafters are. This, however, is of little consequence, as you contemplate having the front lights made to open, and the easiest mode of doing this is to hang them

on hinges at the top. The pipes for heating might be about 18 inches from the front wall inside, and the Vines planted in that space, the roots being allowed to run outside and inside. As you contemplate only having two pipes, we would recommend them to be both together in the front, as the heat will ascend well enough, and the house being a lean-to, the top will always be warmest. We fear the Peach tree on the back wall will not do much good, as the Vines will speedily occupy all the glass and deprive the back wall of light. You might, however, plant a Vine or two against the back wall; they would compete with those on the roof for the light, and you might get a few bunches from them for a year or two, and if necessary one or more might be trained from the top down the rafter. We have seen Vines do very well where so treated. There is no better Grape than Black Hamburgh, but you might also have Buckland Sweetwater or Foster's White Seedling, but let most of the Vines be Black Hamburgh. If you know of any house near you similar to that which you intend building, we would recommend you to inspect it first, and make inquiries whether improvements could not be effected. You will obtain more information about details by such means than can be given in a column of letterpress, and in general you will find gardeners not only willing but pleased to impart information. We are sorry your communication has been unavoidably delayed.

**FLOWERING CINERARIAS EARLY (P. Q.).**—They may be flowered in autumn and early winter, the seed being sown in March in a hotbed, and the plants grown-on throughout the summer in cold frames, shifting them into their blooming-pots in August, and removing them in September to a light airy position where they will have a temperature of 45° to 50° from fire heat. If kept in an ordinary greenhouse they will not flower until the next year. We have some now in a greenhouse at 40° to 45° that were sown last March, and the flowers are just expanding.

**ROW FROM A QUART OF PEAS (Idem).**—A quart of early Peas will sow a row 100 feet long, but as the early crops have greater vicissitudes of weather, and wet and cold soil to contend against, we sow rather more thickly, allowing a quart to 90 feet. A quart of the large kinds as the Wrinkled Marrows, will sow a row 120 feet long, allowing for casualties.

**PROPAGATING POMME DE PARADIS STOCKS (G.).**—These will strike root from cuttings of one or more years' old wood, but are best of two or three years' growth, inserted two-thirds their length in moist soil, and about 8 inches apart. The cuttings should be 9 or 10 inches long, and all the eyes ought to be removed except the three uppermost. They should have a warm soil, as from our experience this stock is not suited for the Apple in bleak elevated situations and northern parts of this country. The cuttings should be put in from November to February inclusive. Layers are the best mode of propagation, make stouter stocks in a shorter time, and, consequently, sooner fit to be worked than those from cuttings or suckers. The layers should be made from November to February.

**COVERING CROCUS BULBS WITH SOIL (P. D. W.).**—We have never grown our Crocuses with the bulb on the surface, or partly covered with soil, but always cover them with soil 1½ to 2 inches deep, which we consider quite deep enough for those grown in pots. Even Hyacinths we bury up to the neck, entirely covering Tulips and Narcissuses. The Celery you mention as being sent to us by book post has not reached us; and judging from what you say, we do not think the caterpillars, beyond the injury to the leaves, will have done the Celery any harm. A Melon frame should face the south, but will answer if facing south-east, but the former aspect is to be preferred.

**PASSE COLMAR PEAR NOT RIPENING (Q. Q.).**—This Pear ripens very well with us in the neighbourhood of London as a pyramid on the Pear stock. Its cold districts it would require a wall. With us it is now in season. As it does not succeed on your wall, we advise you to re-graft it with some other sort. It likes a rather dry warm soil; if grown on unsuitable soils the flesh is gritty.

**PANSIES AND VIOLAS (Idem).**—Write to Mr. Ware, of the Hale Farm Nurseries, Tottenham.

**APPLE TREE WITH BARK PARTING FROM THE TRUNK (E. M. M.).**—Remove all dead bark with a sharp knife, and wrap haybands round the trunk.

**NAME OF FRUIT (J. Hill).**—We do not recognise your Shropshire Apple. It is a fine variety for culinary use, and as it is an almost universal bearer, ought to be more known.

**NAMES OF PLANTS (Kildare Subscriber).**—*Contaura candidissima*. (H. Hicks).—We cannot name plants unless their flowers are sent; nor did we ever hear of the name "Creeping Myrtle."

## POULTRY, BEE, AND PIGEON CHRONICLE.

### THE PAST AND THE PRESENT YEARS.

CERTAIN subjects get old; and if we had to deal with them only, we should shrink from the fact we had nothing new to relate or to chronicle, that our best efforts would be "as tedious as a thrice-told tale," and that we should do well to let the time and opportunity pass.

But there are other and better things that are always new, and which we believe we have in common with the rest of mankind. There are seasons when it is impossible to think of passing time without serious feeling. Thus, when year after year we approach the subject of the new one, we neither wish to nor can repress a feeling of gratitude that we have been spared so many years to report upon the past and to hope for the future, to avoid the shipwrecks in that which is beginning by using largely the experience we have gained in times past.

We have no need of a profession of faith; our ideas and opinions are known, and we are proud to say they are approved. We have no new flag to hoist. For many years we have endeavoured to hold an even balance, to spare no criminal from "fear, favour, or affection," to charge no innocent one from "hatred or malice." The confidence of our friends, and a constantly-increasing circulation with its attending prosperity, embolden us to speak as we do. While we do not hesitate to say this much for ourselves, yet as we know the greatest military

talent would be useless on an emergency without men or stores, so we know nothing that we could do would avail unless we were supported by our subscribers and readers. To them we tender our hearty thanks.

In treating of poultry, and of those pursuits that are connected with it, we have to view it in a light comparatively new, but one that increases daily in importance. Poultry and Rabbits are producing large quantities of food, and will produce more. In the teeth of the fact that food is daily increasing in price, that it is admitted to be scarce, we cannot ignore the evidence that the amount hitherto raised only induces us to consider how much more may be done by painstaking and judicious selection; also by a larger amount of encouragement given to those classes that are food-providers contributing both weight and quality. It is often to be regretted that shows seem organised more with a view to bring together birds that are admirable for feather rather than food. The question is so important that it cannot fail to bring itself forward; and when it is seen that poultry now enters into the consumption of the artisan's household and into the feeding of the people, it is worthy the consideration of all, that they may devise the means by which increased production may be attained. Taking the question of Rabbits when they are imported by the ton, of eggs counted by hundreds of millions, of Geese and Turkeys by thousands, consuming a great part of the produce of Picardy and Normandy, we cannot help asking ourselves whether some of the many thousands of pounds paid for these things may not be kept at home, or whether, viewing these things as trivial, we do not allow the idea to rob us of the energy and perseverance that are the characteristics of our race. In this short notice we do not purpose to go into the question, but it must be done at some future time.

A review of the poultry year is made easy and comparatively unimportant by the exhaustive articles that constantly appear in our columns. It would appear that many of the weight-making birds have nearly reached the possible limit. Among these we may class Ducks, Geese, Turkeys, and fowls. We do not say that some may not at times be exhibited of enormous weight, but as an average we doubt if they will still increase. The judgment of the public has been as usual correct in the treatment of the French breeds, and that which has before happened has repeated itself. The La Flèche, popular as they are in the district which gives them their name, have been fairly and anxiously tried, and found wanting. They will not acclimatise. The Houdans and Crève-Cœurs not only hold their own—they improve greatly, and we doubt whether those bred in England could not successfully compete with their foreign brethren. For those who detest a broody hen, and do not care for chickens, the introduction of these birds is a boon, and as they become well known in their properties and requirements, which they do a few years after their introduction, they can be profitably kept. The size of the eggs they lay is a great advantage. Among the breeds that have hardly remained stationary may be classed the Spanish. Their properties are so similar to those of these French breeds, that it may fairly be supposed some who took to the French forsook the Spanish.

Hamburgs have certainly improved during the past year. Malays have taken an onward and upward stride. We are glad of it. These old and meritorious servants have been too long in the cold shade of public neglect. Aylesbury Ducks are falling off in numbers and weight, while the Ronens flourish in both particulars. We suppose fashion is not confined to costume or apparel; it has its influence on poultry. Many years since there were large and long classes of Sebright Bantams. Their merits were so even that they were the plague of the judges. Merits were magnified, and defects dwelt upon in order to come to a decision. Now it is difficult to get a dozen together. Then the Black and White were bred to marvellous perfection. They, too, have dipped their flag to the Game. The numbers in which these birds are shown are very great, and exhibitors have realised that it is necessary to show Game Bantams, differing only in size from their larger brethren.

Most attractive classes have sprung up in those for Carolinas, Mandarins, and other varieties of wild fowl. The numbers of the first two in their separate classes, all of startling beauty, and in perfect plumage, formed at Birmingham one of the most beautiful sights ever seen. The varieties showed birds in a perfect state of domesticity, which some years ago were known only to "hardy explorers," or through books.

The year has been a pleasant one for those engaged in poultry. Without being exceptionally favourable for rearing, the difficulties of temperature were not insuperable. There has been a ready sale for almost all sorts. Shows have been well supported in every way, but some alteration will be required with some of them. The pursuit must still be made a holiday for ladies, and a thing in which they take a personal interest. We are truly grateful we have only to do with these ordinary things. We have no abuses to expose, no threatenings to publish, no complaints to make.

When we think of those with whom we are brought in weekly contact, our thoughts have to do with friends only. We summon

them in imagination; we view them with our mind's eye, and warming with the contemplation, we suit the action to the thought, and, holding out our hands, wish to all our friends, and subscribers, and contributors

A HAPPY NEW YEAR.

## POULTRY JUDGES.

HAVING been an ardent admirer of poultry for the last fifteen years, and a successful breeder and exhibitor at most of our large shows for the last twelve years, I look upon the controversy now going on upon the above subject as one of great importance to all fanciers, and I agree with the Rev. E. Bartrum in saying that with so many new shows springing up, and the number of qualified judges diminishing, it behoves everyone to bestir himself and do his best to avert such a calamity. I confidently recommend to committees of poultry shows Mr. Samuel Burn, of Whitby, who has been a breeder of nearly every variety from his youth, and a prizewinner at all of the great shows; in addition I know from experience that his heart is thoroughly with the fancy, and nothing gives him greater pleasure than to meet his brother fanciers and have a chat about their pets. Of his ability to judge all varieties I have no doubt, and I am convinced that whatever committee will give him a trial will be thoroughly satisfied. I may here mention that Mr. Burn was engaged as one of the Judges at the North of England Show held at Whitehaven last January, and his awards gave such general satisfaction both to exhibitors and the public, that the local newspaper speaks of him thus:—"Mr. S. Burn made his first appearance here, but if we may judge from the expressions of satisfaction on all sides with his awards, it will not be his last."—EDWARD FEARON, *Whitehaven*.

## BAD FASTENINGS OF POULTRY BASKETS.

FROM time to time I read in your Journal complaints from exhibitors at shows, of their birds having been stolen or exchanged, either at the show or on the journey to or from, and no wonder after what I saw a few days since. On the Reigate town railway platform there were two new close-woven wicker-work baskets, about 40 inches deep, with lids to correspond, but without any handles—all most suitable; and yet how were they fastened? One loosely with a very thin piece of string; the other also loosely, with one piece of string rather thicker than the other, but half worn through. Each lid might be easily lifted up 2 inches, and if roughly lifted by the lid the strings would, without doubt, have given way. I called the attention of the railway porter to the fact, and presently a youth came and put to each basket two or three more fastenings of *thin twine*, and these baskets were going in this state to the Lewes Poultry Show, and would have one or two railway changes to make before arriving there. Is it, then, to be wondered at that birds are lost if sent in such a careless way? The senders have no ground of complaint if birds are sent back on their return journey equally carelessly packed.—W. D. P.

[We can fully sustain our correspondent's statement. Exhibitors complain of losses, and too often charge them to the carelessness of the show or railway officials, whereas the exhibitors have taken no proper care to employ either efficient baskets or efficient fastenings.—EDS.]

## BROMLEY POULTRY SHOW SCHEDULE.

ALLOW me to call attention to what I consider an important omission in connection with this schedule, I mean the absence of the names of the members of the Committee. The prize list is a very liberal one, and if it do not produce a good entry I am sure it may be attributed to this cause, as exhibitors like to know that they are trusting their birds to gentlemen of experience in poultry-keeping, and that their birds will be properly cared for; and further, it is only natural that, after paying their entry fees, they should feel a little anxious to know who is responsible for the payment of the prize money.—AN EXHIBITOR.

## HATCHING DUCKLINGS LATE.

MANY readers of the Journal have, no doubt, often heard it said that young Ducks hatched after midsummer will not live. Many, too, have probably accepted the saying as true without putting it to a practical test. I, at least, know not only of some persons taking a great interest in poultry, but also of some very good farmers who have done so. One farmer with whom I am acquainted, who is well known for his good farming, and who by no means despises poultry as a source of profit on his farm, would as soon think of attempting to rear ducklings in October or November as of attempting to make a crop of hay in March. Indeed, I know as a fact that, although his Ducks lay an abundance of eggs each autumn, he will not use them for sitting purposes, but sends them into the market for sale at the same price

as his hens' eggs. To all persons who have believed the adage above referred to, I would say, Put it to the test of its truth at the first opportunity; for I feel sure that, having once done so, they will not in future abstain from trying to rear ducklings late in the year, but that they will, on the contrary, try to rear as many as they can. To sit them on Ducks' eggs is an excellent way of making use of the hens which fall broody in the autumn; for it not only affords the birds a rest, but it also prevents their time from being wasted. I have tried the plan myself, and I find that it succeeds very well; indeed I must admit that its success has exceeded my expectations. Hens thus employed, even if not allowed to sit, would not lay during the winter months; but the rest obtained during the period of incubation will bring them to lay again early in the following spring. As regards the ducklings I find but little difficulty—I may even, perhaps, say no difficulty—in rearing them. I can usually obtain Ducks' eggs enough about the middle of September, so that I have my young lards hatched about the middle of October. By the last week of December or the first week in January they are fit to kill, and at such a season they will, if I desire to sell them, realise a good price.

My plan is this: The hens being broody—I prefer rather lightly-built short-legged Cochins for the purpose—I take the freshest Ducks' eggs that I can possibly obtain, and place nine or ten eggs under each hen. The nests are made of soft straw upon an ample foundation of dry earth or finely-sifted coal ashes. This foundation not only aids cleanliness, but also serves to keep up a uniform warmth. For some few days before the time for hatching expires I sprinkle the eggs once a day with warm water, and sometimes I do not hesitate, even though it be autumn, to plunge the eggs into a bucket of such water a day or so before hatching, allowing them to remain there some few minutes. From nests of eggs thus treated I have had a duckling for every egg, and the broods are usually good in point of numbers. The young birds, too, are generally strong, and once hatched I seldom lose one by death. At first they are fed upon oatmeal, ground oats, or barleymeal, slaked with water and made rather thin, and as they grow older upon corn, which is placed in shallow pans of water. For some few days they are not allowed to enter any water, except such as they find in these pans, and at no time are they permitted access to a pond or any other large piece of water, but are confined to a trough or a small pool. Treated in this manner they thrive well and rapidly, making fine birds about the period already named. I may add that the birds should be housed at night, and it will be all the better for them if they are well littered down with clean straw.—R. W.

## MANCHESTER POULTRY AND PIGEON SHOW.

FROM its long-continued success this Show now stands in the first rank: and the thirteenth annual Exhibition, held from the 24th to the 27th December, was such as to well maintain its high position. The honourable and methodical manner in which everything relating to previous meetings has been carried out, was followed to the letter during last week's Exhibition; and as the Messrs. Jennison are an enterprising band of young men, by no means willing to be left behind in catering for the wishes of a sight-seeing public, this season for the first time a fat cattle show was added, the management of which deserved equal credit with that of the dog and poultry shows. We cannot but allude briefly to the excellent arrangements for this new feature. In a permanent building, 100 yards long and of proportionate height, with thorough ventilation, and marked by extreme cleanliness, were placed the cattle, sheep, pigs, roots, and vegetables, the animals being all supplied with an abundance of excellent straw, and in stalls of such ample size that most of our show committees would do well to imitate them. As the stock entries, it appears, comprised most of the principal show animals in the kingdom, we feel assured the future patronage of the owners of such stock may be relied on. From this digression we must now return to the poultry. We confess our own opinion is decided, that the division of the poultry into three portions, the intermediate spaces being allotted to dogs, proved the very opposite to an improvement. It should be borne in mind that amateurs and breeders of poultry are by no means of necessity passionate admirers of the canine race, and being thus forced to pass backwards and forwards among the dogs does not add to the satisfaction of those persons whose predilections point exclusively to the feathered tribes. Most probably, after having given it this year's fair trial, the plans of former years will be restored.

In *Dorkings*, Coloured, Manchester very far surpassed any show of the present year, all the classes being thoroughly good throughout; although in the class for any other variety of *Dorkings* except Coloured and Silver-Greys, only a single pen of Whites was entered, and this, though good, was not of unusual excellence. Of Grey *Dorking* cockerels there were twenty-six pens, all but one present, and with such excellence throughout as to render this one of the most notable classes in the Show. We were glad to notice in these, as in all the other classes for *Dorkings*, perfect feet were the order of the

day—scarcely a gouty or hump foot was to be seen. As to the *Dorking* pullets and hens a more worthy or even lot has rarely been brought together, the Dark-feathered, now so esteemed, proving their customary superiority when handled for closer inspection. In *Silver-Greys* were to be found some of the truest-plumaged specimens seen for many years, a few excellent-shaped though otherwise faulty-feathered cocks being among them. The *Spanish* classes were abundantly filled with grand specimens, the hens and pullets being the most praiseworthy. Of *Buff Cochins* there was a really first-class display. As a rule, however, the adult cocks proved in the worst show-trim that could well be imagined, some of the grandest birds of the day being penned in so thoroughly exhausted a condition from over-showing as to imperil their existence. It was a very remarkable feature of the Show that only two pens of *Buff* hens were entered—both, however, very good. In the pullet class *Lady Gwyder* was successful with a pair of the best shown and matched birds we have seen for some years. Although so many of the finest of the pullets were to be found in this class, it was a fault that many had twisted hackles—a grave objection, and one that develops itself still more as time goes on. As this failing is difficult to breed-out, careful breeders will avoid them when selecting brood-stock. *Partridge-feathered Cochins* were in force, and the rich brilliancy of condition of the plumage of many of them was most noteworthy. Whites were also by no means the least deserving of praise among the *Cochins*, many among the hens or pullets being the very types of what is desired in this admired variety. Both *Dark* and *Light Brahmas* were very fine specimens, constituting large classes, and almost without exception of good quality. There certainly has not on any previous occasion been so excellent a display of *Polish* at Manchester as there was this year. In fact even the prize birds at Birmingham could not hold place here against new comers. All the *French* breeds were capital, and the entries of these varieties were unusually heavy. Of *Game* fowls the *Brown Reds* were decidedly the best shown, and the faultless condition of the majority was beyond question. On the other hand, but few of the *Game Bantams* were in the robust health desirable in show birds. In the *Extra* variety class were four pens of *Black Cochins* well worthy of note, and some especially perfect-feathered ones of the *Cuckoo* variety.

The *Geese*, *Ducks*, and *Turkeys* were marvels as to size, but in a hasty glance along the *Rouen Ducks* several very characteristic traits were wanting. As customary at *Belle Vue* shows, the class for *Ornamental Waterfowls* was of an extremely interesting character. Among some twenty-one pens, the most notable entries were *Cereopsis Geese*, *African Purple Gallinules*, *Casarka Ducks*, *Mandarins*, *Carolinans*, *Chilian Pintails*, *Garganics*, *Pintails*, *Pochards*, and many others. So covetable were they, as a lady visitor expressed herself, "she could not tell which she liked best, for she should want them all."

A correspondent gives the following as the weights of the prize *Turkeys*—viz., First-prize old cocks, 36 lbs.; second-prize (American), 39 lbs. 11 ozs. First-prize old hens, 37 lbs. 2 ozs.; Mr. Lythall's unnoticed pen, weight 41 lbs.

**DORKINGS** (Coloured, except *Silver-Grey*).—*Cockerel*.—1, J. Longland, Grendon. 2, J. Walker, Rochdale. 3, Miss Davies, Chester. 4, J. Stott, Healey, Rochdale. 5, J. Longland. 6, W. Copple, Prescott. 7, Mrs. F. S. Arkwright, Sutton Sealand. 8, Mrs. T. W. L. Hind, Kendal. 9, Lieut.-Col. H. B. Lane, Brackley. 10, Mrs. F. S. Arkwright. 11, T. Statter, Kendal. 12, Mrs. F. S. Arkwright. 13, Mr. F. S. Arkwright. 14, R. Price, Ebbwias, Balis. 15, Mrs. T. W. L. Hind. 16, T. N. Leyland, Ruthin. 17, J. White, Warlaby (2); Miss Davies. 18, J. Copple, Eccleston, Preston.

**DORKINGS** (Coloured, except *Silver-Grey*).—*Cock*.—1, Lieut.-Col. H. B. Lane. 2, W. Copple. 3, J. Longland. 4, Mrs. F. S. Arkwright. 5, J. Longland. 6, J. White. 7, L. Pilkington, Wilnes. 8, Lieut.-Col. H. B. Lane. 9, C. T. Statter.

**DORKINGS** (*Silver-Grey*).—*Cock*.—1, W. W. Rutledge, Kendal. 2, T. Raines, Bridgebaugh, Stirling. 3, T. Statter. 4, Mrs. F. S. Arkwright. 5, W. W. Rutledge. 6, T. Raines. 7, W. W. Rutledge.

**DORKINGA** (Rose-combed, or any other variety not before named).—1, J. Robinson, Garstang.

**SPANISH**.—*Cock*.—1, W. R. Bull, Newport Pagnell. 2, Enoch & Boulter, Sheffield. 3, Furness & Sudall, Rawtenstall. 4, Mrs. J. Leeming, Broughton, Preston. 5, Mrs. Tonkin, Bristol. 6, T. Paterson, Langholm. 7, J. Silbott, Wolverhampton. 8, J. Bowden, Newchurch, Manchester.

### WHITBY POULTRY SHOW.

The fourth annual Show was held in St. Hilda's Hall on December 30th.

DORKINGS.—1 and 2, J. White, Waraby, Northallerton.  
 COCHINS.—1, D. & J. Ibbotson, Whitby. 2, T. Readman, Whitby.  
 BRAHMA POULTRY.—1, Dr. Holmes, Chesterfield. 2, J. Watts, Birmingham.  
 SPANISH.—1, R. Newbitt, Epworth. 2, Fallister & Hawkins, Thirsk.  
 GAME.—1, W. Adams, Beverley. 2, J. Robshaw, Whixley.  
 HAMBURGERS.—Golden-spangled.—1, T. Boulton, Hanford, Stoke-on-Trent. 2, W. A. Hyde, Hurst, Ashton-under-Lyne. Silver-spangled.—1, J. Fielding, Newchurch, Manchester. 2, G. Speedy, Whitby. Golden-pencilled.—1, W. Clayton. 2, T. H. Readman. Silver-pencilled.—1, T. H. Readman. 2, G. Speedy.  
 ANY OTHER VARIETY.—1, J. Fielding. 2, C. Walker, Boroughbridge.  
 BANTAMS.—Game.—1, W. Adams. 2, W. C. Dawson, Whitby. Any other variety.—1, R. H. Ashton, Northam. 2, F. Watts.  
 DUCKS.—1, T. C. Carver, Langthorpe. 2, P. C. Bedlington, Whitby.  
 SELLING CLASSES.—1, T. C. Carver, Langthorpe, Boroughbridge. 2, J. W. Corner, Epton. Cock.—1, T. E. Satterthwaite, Castle Howard, York. 2, T. Blackburn, Northallerton. Hen.—1, J. Carr, Whitby. 2, T. H. Readman.  
 GEESE.—1, J. B. Braithwaite, North Otterington. 2, I. Wilkinson, Whitby.  
 TURKEYS.—1, J. B. Braithwaite. 2, T. C. Carver.  
 BARNDOR.—1, W. Cutlack, jun., Littleport. 2, E. Barker, Stokesley.

### PIGEONS.

TUMBLERS.—1, W. Adams, Beverley. 2, J. Hawley, Gillington, Bradford.  
 CARRIERS.—1, J. Hawley. 2, G. Sadler, Boroughbridge.  
 POUTERS.—1, J. Kilpatrick, Whitby. 2, J. Hawley.  
 FANTAILS.—1, J. F. Liveridge, Newark. 2, J. P. Fawcett, Whitby.  
 JACOBIANS.—1, J. Blanchard, Great Driffield. 2, R. W. Richardson, Beverley.  
 ANY OTHER VARIETY.—1, J. Ledderer, Bootle, Liverpool. 2, J. Hawley.  
 SELLING CLASS.—1, J. Hawley. 2, J. P. Fawcett.  
 BARBS.—1, J. Hawley. 2, R. W. Richardson.  
 MAGPIES.—2, J. Blanchard, Great Driffield.

JUDGES.—Poultry: Rev. T. Phillips, Robin Hood's Bay; Mr. W. Stonehouse, Darnholme; and Mr. J. Webster, Hawsker.  
 Pigeons: Dr. Alexander, Castleton.

### ROYAL DUBLIN SOCIETY'S POULTRY SHOW.

This Show, so far as numbers and quality went, was the best ever brought together by the exertions of the Superintendent. Every possible care was taken of the birds, and there was a class each for old and young poultry.

Silver-Gray Dorkings over a year old were a large and even class, the first prize going to a beautifully-coloured cock, but not so large as the second, which was of great size, but not of good colour. Many good birds were highly commended, and in the young class it was the same. In Coloured Dorkings the first and second prizes went to birds of giant-like proportions and proper colour, which cannot be said of their rivals, which were too like Silver-Grays. Among Spanish there were some fair specimens, the first prize pen being nice and smooth in face; cauliflower birds were passed over. Light Brahmas are steadily increasing in favour in Ireland, and were a large class, but most of those shown were very defective in marking, the first and cup young birds being the only properly hatched pair, and they were good in all points, having the true Brahma shape and character, in which the others were rather deficient. The Dark were very superior, and contained many fine specimens, being of much better colour and shape than the Light. The first-prize adults were far ahead of the others; the hen, being remarkably well pencilled, carrying off the cup. The second were also a good pen, but the hen was not so well marked as the first-prize one. The young class contained many good and promising birds. These two classes were the best in the Show and hard to win in. The Buff Cochins formed bad classes, but the first-prize young birds were a grand pair in all points, and wonderful in colour and size. The first-prize Partridge cock was second at the Palace. Blacks had five entries for two classes—good for Blacks, the cup going to old birds. The prize young birds were those which were first at Oxford. All were of good colour, but wanting in shape and size. Of Game there were many good specimens, the first-prize Black-breasted and the first-prize Duckwings being all that could be desired in the adult class. Of Hamburgs there were few good birds, and Polish were poor. The prize French were good in colour and of large size. In the Variety class Sultans were first and Black Hamburgs second in the old section, and Scotch Greys first and second in

young. All Scotch Greys should retire to the dunghill; better have been seen there. Game Bantams were a good class; the first and second prizes went to large Game in miniature. Turkeys were of great size, but the smaller ones were the best in colour. Geese were very fine; the first and cup young birds were of great size. Of Rouen and Aylesbury Ducks there were very even classes, which gave the Judges something to do. Mandarin and Shell-drake were first and second in Ornamental Waterfowl.

Pigeons.—Pouters, except the winners, were only moderately good. Carriers were good classes, the winning cock and cup bird being good except in size; the second-prize cock was good, but "spouty;" the winning hens good. The first 1873 birds have the makings of grand birds, the second were over age. The winning Tumblers had good heads and beaks, Yellow and Yellow Agates. The first-prize Barbs were a wonderfully-developed pair of Duns; the second good Blacks, wanting age, when they will make their way. Young Barbs were very promising. In Fantails the winners were good in all points, especially fine in head and neck. For Red or Yellow Jacobins the first prize went to grand birds but of bad colour, the second running them closely, but of better colour. Jacobins of other colours were all Black, the winners grand in colour, and all that could be desired in other points. In Turbitts good Blues were first and second, and Blacks and Yellows took the prizes for other colours, both being fine pens. The first-prize Trumpeters were a wonderfully-developed pair of birds, but those which took the second place were superior in colour. The first-prize foreign Owls were far ahead of their rivals, which were half-bred English and foreign. In Homing Pigeons the winners were Show Antwerps. Dragons contained some young Blue Carriers; Blues of a genuine type were first, Yellows badly matched in head, but of good colour, being second. The Blues had what I think shows the true Dragon—a black look in their eye wattle. Winning Nuns and Magpies were nicely marked and coloured birds. Runts and Swallows won in the Variety class. Without fear of contradiction it may be said that the Show, taking it altogether, was the best in quality and entries ever held by the Royal Dublin Society.

The Judges were Messrs. A. F. Staunton, J. Croasbie Smith, and H. Merry. The list of awards appeared at page 499.—S.

BURTON-ON-TRENT POULTRY SHOW.—I have a note from the Secretary stating that Mr. A. O. Worthington, after winning the cup he had given for competition in Light Brahma, very considerably passed it over to the next winner, who was Mr. H. Chawner, of Hound Hill, Utttoxeter.—E. HUTTON.

LOWESTOFT POULTRY AND PIGEON SHOW.—The seventh annual Show of this well-conducted Society will be held on the 12th and 22nd of January, when twelve silver cups will be distributed in thirty-seven classes, as also three prizes and two local ones in each class. The Judges are the Rev. T. F. Fellowes and Mr. Hutton, and the entries close on the 6th inst.

### NOMENCLATURE OF PIGEONS.

In remarking on the young Blue Carriers at Glasgow you mention one as "Silver Dun." If by this you mean "Mealy," I have nothing to say, except that the Antwerp breeders have originated two misnomers—namely, "Silver Dun" for Mealy, and "Red Chequered" for Mealy Chequered. If you mean Silver, the word "Dun" is not only superfluous but positively erroneous. Every solid colour has a corresponding colour barred by it—viz., Black has blue barred with black; Dun, silver barred with dun; Red, mealy barred with red; Yellow, buff barred with yellow. Therefore, if Silver Dun signify "silver barred with dun," Blue Black signifies "blue barred with black," Mealy Red, "mealy barred with red," and Buff Yellow, "buff barred with yellow." However, Blue Black, Mealy Red, and Buff Yellow (sometimes called "Mealy Yellow") signify a bad-coloured Black, Red, and Yellow respectively; Silver Dun therefore means a bad-coloured Dun. As the Antwerp breeders have, as I said before, wrongly appropriated the name, I trust that you will not make confusion worse confounded by calling a Silver "Silver Dun."—TURKEY QUILL.

[Our reporter must defend himself. If he erred, he erred in good company.—Eds.]

### POUTERS, ANY OTHER COLOUR OR MARKINGS CLASS.

THERE seems to be a growing inclination to do away with this class of birds at our shows, and some committees have already excluded it. I think this is a very great mistake, and one which will be found out when it may be too late. I have two main reasons for so saying. First, Young and poor fanciers are excluded; they cannot afford to buy standard birds, their stocks

are accounted worthless, and their aspirations as Pouter fanciers are nipped in the bud. We all know the feeling when first told of our success as prizetakers, and the pleasure we have at seeing our birds marked at the shows. Even a "commended" or "highly commended" is better than nothing, and if conscientiously so labelled, it must be esteemed a great step by a young or poor fancier, particularly at a large show. Many of us have had to fight our way up from a few birds of "Any other colour or markings," and why discourage others feeling their way in the same path? But, second, the committees who exclude this class surely do not know that they are striking at the root of some of our finest breeds. Those who can purchase a stock of standard birds must not think that they can perpetuate all the points; the strain will gradually dwindle down and die out. We must every now and then have something to put size into our strains, to give length of feather and length of limb, and that style which is imperative, besides keeping up the purity of colour. It is from the discarded class that all this is to be had. What better bird can be had than a Sandy for giving the Black-pied style and colour? Or a Mealy for killing the chequer marks on the Blue Pied, and in place giving that soft solid hue so much wanted? Or a Splash for adding size and length of limb to the Blue and to the White? Were it not for the Splash (any colour) our Whites would go out altogether, or, at all events, become small delicate birds not worth the keeping.

It is all very well for those who keep Pouters for exhibition to look with a cold eye upon this class, but we breeders have worked upon it before the first show was thought of, and had we not done so there would not have been the birds which are now being exhibited. I have heard some fanciers say they would kill every bird that was not up to standard marking, and if this were put into practice generally, there would, by-and-by, be no Pouters either to kill or show. We cannot do without this class, and it ought to be encouraged at all shows. Besides, in it there are often found some of the handsomest Pouters in the show, and we must recollect that it is neither colour nor marking, but shape, that constitutes the Pouter Pigeon. This class also often adds considerably to the amount of entry money, and I consider that committees who exclude it from their shows are not only damaging the Pouter fancy, but quarrelling with their bread and butter.—JAS. HUIE.

### NEW BOOKS.

*The Brahma Fowl.* By LEWIS WRIGHT. Third and Revised Edition. "Journal of Horticulture" Office, and Messrs. Cassell.

OCCASIONALLY—very occasionally—one meets with people, usually the wrong side of seventy, who speak of anyone who goes to a poultry show as "gone to look at cocks and hens," or who connect Pigeons with "Blue Rocks 10s. a-dozen, gents;" these latter not the least the wrong side of seventy, but sporting striplings of, with them, the silly side of twenty. But putting aside such, there were many who, until our Crystal Palace shows and our handsome volumes on poultry and Pigeons, had no idea whatever of the striking beauty which was to be seen among these birds. The Crystal Palace Shows I regard as the educators of the English eye on poultry subjects. Other shows are held in places often out of the way and not architecturally pleasing, and consequently the world in general is absent; but one Crystal Palace Show is of more value in spreading further and further the love and culture of poultry and Pigeons than all the other shows of England put together. Everyone sees it advertised and thousands visit it; and I hope its promoters will give six prizes, or even eight prizes where they now give four, and make it the Derby of the poultry world, and its first prizes immeasurably beyond in esteem any other first prizes whatsoever.

I consider, then, the great Crystal Palace Show as the eye-educator of Englishmen in matters of poultry; and as a larger number of well-off people live near London than in any other neighbourhood, so we shall have a larger number of poultry, and especially Pigeon fanciers and exhibitors, resident within twenty miles of the metropolis.

But among the mind-educators of English people on poultry subjects stands first and foremost Mr. Lewis Wright. His style is pleasing. He begins a chapter in a way to catch the general reader and make him read on. A mere dry detailer of poultry points would and could never do this. It is not my province now to speak of Mr. Wright's greatest work; of that another time, when its last number has reached me. I speak this week of his second published work, and of that work's third edition. "The Brahma Fowl" saw the light in 1870; in eighteen months a second edition was called for, and now is issued a third. This is a sign of the times. Here is a volume which touches the pocket to the amount of five shillings, and treats of only one variety of poultry, yet which has had so rapid a sale. The sale has also, I believe, not been limited to England, but in America the work has been largely bought and read. I have spoken of the career of this work as a sign of the times: it is so in more respects than one. Fifty years ago no one would have been so

unwise as to publish a five-shilling work on any one variety of fowls, and if they had it would have never reached a third edition within its third year. If there had been such a one it would have been on fighting cocks, but not one on a gentle, home-loving, domestic bird like the Brahma. The times are changed, and the age of patronised cruelty is at any rate gone.

This third edition of "The Brahma Fowl" is like the first edition, and yet different. It is the same in size, shape, and has exactly the same number of pages and the same number of coloured pictures; but the pages are not the same, nor the pictures. The pictures in the first edition were good, but in this third they are better. Markedly so is the portrait of the Dark Brahma cock and the Dark Brahma hen; the latter is especially a lovely bird. There is a pleasant fact connected with "The Brahma Fowl," that it led to its author writing his great "Book of Poultry." Thus Mr. Wright tried his wings with the "Practical Poultry-keeper," strengthened them with "The Brahma Fowl," and soared away into full public favour with "The Illustrated Book of Poultry."

The Brahma is Mr. Wright's especial fowl; and although as yet, owing to limited accommodation for his pets, he has not been a large or general exhibitor, yet a large proportion of the winning chickens of the last two or three seasons have been bred on one side or the other from his strain, and a hen hatched from eggs supplied by him realised the largest sum of money given for any single hen of any breed during the last twenty years—viz., £20.

"The Brahma Fowl" treats fully on the subject indicated by its title, beginning with the origin of the Brahma, then speaks of its qualities and management, contrasts the Dark and Light varieties, and goes on to speak of breeding, rearing, and managing Brahmas, finishing with a chapter on judging them.

I always tell anyone desirous of taking to poultry, Adopt one variety—that which you fancy, and which those who understand the matter think your home is adapted for; and then read-up the subject and get your variety; and above all things, if you wish to succeed, stick to it. If Brahmas be your fancy—and if they are there will be smiles for you from your wife and children, or you will have eggs for breakfast when perhaps your neighbours have none; and the kitchen denizen or denizens, the maid of all work or the grand cook, will willingly save-up scraps and learn to help you, as they find what a kitchen friend for eggs and chickens is the Brahma. Let such a man or woman (ladies are excellent fanciers, indeed among the very best), with a Brahma turn get this work, read it hard, master its contents, and within the first season he or she will save its cost over and over again.—WILTSHIRE RECTOR.

*Pheasants for Coverts and Aviaries.* By W. B. TEGETMEIER. H. Cox, London.

THE eleven engravings are beautiful, including the species of Pheasant for use and ornament, known in this country; the paper is equal to drawing paper, and the binding handsome. The literary part is useful, but chiefly a compilation.

### HIGH-COLOURED CANARIES.

We were very much surprised to see in your Journal that the receipt for breeding high-coloured Canaries belonged to Bemrose and Orme. We wish you to understand that we (Wright and Shaw, of Sutton-in-Ashfield), sold this receipt to Orme last year (1872), with an understanding that he was not to divulge it to anyone. We are very sorry to learn that he has deceived us. This year the birds exhibited by Bemrose & Orme principally have been bred and moulted by us.—WRIGHT & SHAW.

[I forwarded a copy of the chief contents of this note to Messrs. Bemrose & Orme, to which Mr. Bemrose replies as follows:—

"I beg to say Mr. Orme did purchase from Messrs. Wright the method of feeding that we adopted to obtain high colour, which I had known for years but I had never given the food in sufficient quantity. Mr. Orme, contrary to my wishes and unknown to me, told the method of feeding to a man named Bennett. I was not aware of this until some time after, but it eventually came to my knowledge that Bennett and Barnesby (to whom Bennett had told it) were writing to fanciers offering to sell the method adopted by us—in fact, had sold it to several, amongst the number to Holmes, of Nottingham, who gave Barnesby £2 for it. Upon finding this out I at once wrote to you, deeming it the most straightforward course to pursue. I can only say I deeply regret Orme's conduct, and my having had any connection with the case.

"With regard to the latter part of Messrs. Wright's letter, stating 'that the birds exhibited by us were principally bred and moulted by them,' it is simply untrue. At the commencement of the season they had three variegated birds, which I thought would turn out well, but they have not done so. In order to obtain these we had to buy several others quite useless as show birds, having sold three of them myself as song birds for 5s. I am quite willing to admit all that is true, but must protest against

the latter part of their letter. The highest-coloured birds we have shown have been moulted by myself—I moulted ninety-eight, some of the best not having been yet sent out.—E. DEMROSE.

"P.S.—It is my intention at the close of the season to leave the fancy."

There is no need to pursue the subject further in our columns.—Eps.]

## THE BEE-KEEPER'S CALENDAR FOR JANUARY.

IN COMMENCING a calendar in *THE JOURNAL OF HORTICULTURE*, I will state that during the last few years a considerable advance has been made in apian science by a wide-spread section of intelligent bee-keepers. The granite of common sense is cropping-up to the surface in most of the counties of England, and it is on this foundation that all good and successful management in the past has been achieved. The progress made in practical bee-keeping of late is so perceptible, that I cherish the hope I may have the happiness of knowing that thousands of the rural population of England derive a substantial income from bee-keeping.

Some three months ago I received an invitation to visit a village in North Staffordshire. About a couple of hours after my arrival almost all the leading bee-keepers within five miles of the village came to spend the evening with me and my host in conversation about bees. Bee-keeping in that neighbourhood had made no progress from time immemorial till about three years ago, when a book of modern date on the practical management of bees fell into the villagers' hands. They now keep bees for profit, some having fourteen hives, some ten, some seven, and others four hives. I am happy to say that I never met more advanced and intelligent bee-keepers before or since.

If I have to pilot the steamer for twelve months, let me, before I mount the paddle-box, wish all the crew and passengers "A Happy New Year," and express my hope that we shall have fair weather, and a pleasant as well as a prosperous voyage.

### JANUARY.

If bees have food enough in their hives now, the less they are disturbed—indeed the quieter they sit amongst their combs, the better. Though all healthy hives are benefited by the bees taking an occasional airing in mild weather during the winter months, the inmates of healthy hives sit more quietly and closely together than those of unhealthy hives. On turning-up a hive infected with foul brood, we invariably find the bees sitting very loosely in it, and that they at once begin to spread themselves over the combs. On turning-up one of my own hives lately, I saw the bees act in this way, and suspecting the cause I applied some smoke to enable me to examine it thoroughly, when I found it extensively diseased. The bees will be shaken out of it into a hive of sweet combs some night this week.

Though September and October are the best time for feeding bees for the winter, many bee-keepers fail to give enough food at that season, and continue to feed them for months afterwards. Such late feeding is attended with the risk of inducing the bees to commence breeding, and the brood being chilled to death by frosty weather. There is also some difficulty in getting the bees to take food during cold weather, when they naturally seek warmth by crowding together. If necessary to feed in January, let the food when given be warm, say about 100° or blood heat. If the bees will not take it, let them be brought into a hothouse or warm room, and there fed with warm syrup, keeping them in their hives. In such a case I pour the warm liquid over bees and comb, and keep them shut-up for twenty-four hours.

Is it necessary to ventilate hives in winter? No; the smallest door possible affords the bees air enough during winter. With wooden hives ventilation is an advantage, as the greater part of the moisture which (without ventilation), condenses on the insides of the hives and rots the combs, is carried through the ventilating holes. Where wood hives are used, the crown holes should be covered with fly-proof wire, and used as ventilating shafts; and where such hives have no crown holes, I have seen the combs saved by boring holes through the crowns and sides with gimlets and small brace-bits.

During the winter both honey and bees should be protected from house and field mice; during the summer they need no protection from such robbers, but in winter bees sit so closely together in the centre of their hive, that mice frequently enter without molestation and devour the honey in the outside combs, and will even kill the bees and afterwards eat their heads off. How the sagacious mice manage to take bee by bee from the mass and carry them outside the hives without being stung is a marvel; but they do it. I have known many hives nearly ruined by mice eating the heads of the bees, and leaving the bodies in heaps outside. To prevent these depredations we contract the doors of the hives in winter by using pieces of wood with doorways in them, sufficiently large to permit bees to carry out their dead, and small enough to exclude mice.

As wet and cold are hurtful to bees, I may here refer to the protection from these needed in winter. It has been stated by

some one that bees die in a temperature of 31°—that is to say, when the mercury falls to within 2° of the freezing-point inside a hive, bees cannot live. I have not yet put this to the test of experiment, but if it is a fact, the importance of covering bees well in winter cannot be too highly insisted on. The best and neatest covers for hives which I have ever seen were some I lately noticed in Staffordshire. They might be called wooden cases for hives, and were about 20 inches wide and nearly as deep. They stood on floor boards and had moveable lids. The hives placed inside were well protected and easy of access. The cases were large enough for supering, eeking, and feeding inside, and cost 15s. each. I saw eighteen in one garden, where they had a very pleasing appearance. Between the hives and the cases there is space enough for some under-covering in frosty weather. I have never seen covers so complete and satisfactory.

During the active months of summer there may not be space for all I have to say in the first number of the month, and it may, therefore, be necessary to continue my remarks another week. As I am anxious to make these notes as comprehensive as possible, if any of your readers find difficulties in bee-management, on stating them to the Editors they will receive the best consideration and attention.—A. PETTIGREW, *Sale, Cheshire.*

## BEE-FARMING.

IN ANSWER to "G. H.'s" query whether I kill the queens excepting one when uniting three or four swarms, I believe it is the best way to do so, as a young queen may be selected for stock in that manner; but in my practice I have not done so, simply because in this part of the country we keep the heaviest hives for stock (so that there may be no danger in wintering), and such often happen to be the first swarms, consequently second swarms and old stocks which have young queens are generally condemned. These are what I have had to unite, and as I did not fear securing a queen out of the lot, I have taken no further trouble, excepting in my own apiary, where I have followed the practice laid down in the "Handy Book of Bees"—viz., to take the heaviest hives for honey, and feed the lightest to the required standard. I seldom find much difficulty in preventing the bees fighting. I believe scent is the bond of union; for if fighting is going on, by blowing smoke of corduroy or fustian vigorously amongst them the commotion ceases at once.

When taking my friends' bees, which are kept in the small old-fashioned hives, I proceed thus:—Suppose four hives have to be taken, I get four empty hives, blow a little smoke into each of the condemned ones, and proceed just as in artificial swarming, only drumming longer, or till the bees are all out or nearly so. I then place the bees on the original stands and take the honey-hives into some dark outhouse, turn them bottom upwards, and in the course of half an hour what few bees are left in the honey-hives will be glad to escape to their original stands as soon as light is admitted. I then take the two hives next each other, and dash one on its own slab and place the other on it, taking care to fumigate them equally. I wait a short time while these unite, which will not be long in September or October. I then treat the other hives in the same way, and perhaps not more than a score of bees will be lost. I have united stocks in my own garden without the loss of a single bee excepting a queen, which I found underneath the hive.

Respecting the other query on supering I cannot say much, for I have only tried twice—once in 1872, and once in 1873—and have succeeded pretty well by simply placing a little guide-comb in the glass, putting it on an adapting-board, and then over the circular hole—say 3 or 4 inches in diameter—in the top of the hive, without any restrictions to the queen or drones. I am thinking of trying several experiments in supering next summer, and if the weather be favourable your correspondent will be welcome to my experience.—THOMAS BAGSHAW, *Longnor, near Buxton.*

## WHAT IS HONEY?

THE discussion of "What is Honey?" recalls the old controversy of "The Chemistry of Honey," where it was held on the one side that even sugar and water after passing through the body of the bee and stored-up became converted into veritable honey, a doctrine from which our Editors, if I remember, as well as the present writer, entered their dissent.

Mr. Pettigrew is perfectly correct in treating, for practical purposes, sealed honey as a distinct article from the unsealed; the latter, as I have taken occasion before now to point out, will not thicken nor consolidate, even after frost sets in, while the former will stiffen-up and crystallise during midsummer heat; hence the great necessity for bee-keepers on breaking-up hives to keep the two perfectly separate. Unsealed honey is always better given at once as feeding to bees, otherwise mixed with the sealed it has the effect of keeping the whole thin and induces fermentation.

I related a few years ago how I found a very capital straw hive, driven on the twenty-fourth day after swarming, had, at

the end of the season, when a large body of healthy bees were introduced, the unsealed honey covered over with a white fungus, and that it turned out in the spring a mass of corruption from foul brood thereby induced.

While agreeing with Mr Pettigrew as to the distinctness of sealed from unsealed honey, I cannot subscribe to the twice swallowing and disgorging process with the accompanying chemical change thereby brought about. I incline to think, rather, with your other correspondent "B. & W." that of this we want adequate proof; neither do I believe our orderly little favourites act on the haphazard system of tossing the honey "into the first empty cells they can find." On the contrary, such of us as possess uncomb observatory hives are familiar with noting the great time and pains every fresh arrival takes in selecting the cells in which to store away pollen as well as honey, with the evident intention of keeping all properly classified and distinct, and we cannot fail to observe the gradually-filling honey cells in the upper portion of the hive, till at last only the smallest orifice remains in very many; and may it not be that our favourites at this particular stage possess the power, before hermetically sealing-up, to suck-out and extract the aqueous and aerial properties, causing it ever afterwards to consolidate and keep?—A RENFREWSHIRE BEE-KEEPER.

### HONEY SUPERS AT EXHIBITIONS.

I AM very glad to see your able correspondent "B. & W." has taken up the above subject. I certainly did not expect to see exhibited at our flower shows supers filled by artificial means; but as I said in my previous letter, it was unfortunate that it should have been such a bad year for bees for the great Show at Manchester, but at any future show the honey should be honey proper—i.e., gathered by the bees from flowers only. I have been a prizetaker with bell-glasses as well as with hives, but never gave my bees an ounce of honey or sugar in my life, except to feed them up for the winter. I entered in the class for supers, glass and wood, or straw, but had no success in either, though I had my bees on the heather.

I quite agree with "B. & W." that rules should be laid down, but in No. 1 leave out that portion about feeding bees eight months previous to the show. I like to give my bees a little food in March. I would not allow feeding after March. No. 2 I do not agree with. Let the exhibitor strengthen his stock so that the honey may be legitimately stored by the bees.

I was at the Burton-on-Trent Flower Show in August last, and the supers were very poor; many were not half full—very different from what they were two years ago, which was the first show, and I think the best I ever saw except that at Manchester this year. They all said it was a poor season in the Burton district, which I think can be echoed by all bee-keepers.

If some rule could be laid down so as to guide the committees of flower shows, I think they would avail themselves of them. I can name a few shows that I attend in the northern and mid-land counties, and perhaps "B. & W." or other correspondents can assist in the matter, so as to give all a fair chance; but by all means leave a class for the working man both in straw hives and straw supers.—SOUTH LANCASHIRE BEE-KEEPER.

### SALT FOR BEES.

IF "A. T. W., *Kidwelly*," adds a little common salt to his food for bees, particularly in the spring of the year, the food will be greatly improved. Insects, like animals, crave for salt at times. I am, sir, an old bee-keeper and have often watched them, in the early spring, sucking the straw of a freshly turned-out dung-heap from the stable—for what?—it is the salt in the manure.

Allow me to add to this note the very simple mode of taking a hive for honey, practised by me for years. On a very fine sunny day when the bees are fully occupied away from home, stop up the entrance and gently remove the hive some little distance from its stand, then turn it upside down, take away the bottom board, and what bees are at work in the hive will immediately rise in the air and fly back to their old quarters, and from there they will again search for their property, displaying a most wonderful instinct.—AN OLD MAN.

### OUR LETTER BOX.

SEPARATING VARIETIES (*H.*).—It is high time your fowls were separate. If they are laying at the time of the separation you should wait (to prevent disappointment) a fortnight. If they are not laying when put apart for breeding purposes, and begin a week afterwards, you may set the eggs. Where it is intended to set early eggs, the birds should be divided the first week in December. There is little or nothing gained by keeping them together.

BANTAM EGG-ROUND (*W. H. S.*).—If the case be as you represent it, and there is an egg that cannot be laid, the cure is easy, but not so much so as if you could have acted at once. Draw out a wing feather, soak it in castor oil, and introduce it in the egg-passage. You must do it gently, and you must not touch the egg. If the egg be broken in the passage the case is fatal. Lubricate the passage till the egg begins to move, and the cure is rapid. It is probably the first egg. Let Nature do all that is necessary after the oil, and do not help her.

DAK BAHMA'S PLUMAGE (*F. S. G.*).—Many of the best Brahma cocks

have a few buff feathers. They are not desirable, but they are by no means a disqualification. We do not believe the Golden Hamburgs had anything to do with them. The fault is a graver one in pullets and hens. The question of breasts is almost a matter of fancy. The first and best birds ever imported had speckled breasts. No judge would be justified in withholding a first prize from a bird on account of a speckled breast, if he were superior to his competitors in other points.

HOUDANS' CHARACTERISTICS (*Houdan*).—The proper colour of Houdans is black and white speckled, not only in the plumage, but in the colour of the legs. Some prefer darker, some lighter plumage. The essential points of the breed are five claws, good top-knots and beards, and a square Dorking-shaped body.

FOWL HOUSES (*L. S. F.*).—The roosting place of a given number of fowls is not so important as the extent of their run. Six birds will roost comfortably in a space 6 feet square. You can make up the necessary number of cubic feet by taking it out of the clouds. Make your houses 13 feet high. They need only be plank all round, and should not exceed 35s. each.

MAIZE FOR FOWLS (*F. P. G.*).—You would not presume to contradict us, but you differ from us in  *toto* . Granted. *Punch*, some time since, gave us the drawing of two militiamen—"raw material." "Jim," said one, "you be'ant in step." "Be'ant I? then change you'n." We keep a thousand hens and pullets and feed them well. We keep account, and are sure that for early laying maize is not the food. We give a little every day, but our food is ground oats, barleymeal, whole barley of the best quality, and scraps. We believe in no foods. We are never without eggs, but we do not come up to your numbers. May your eggs never be less.

CANTERBURY POULTRY SHOW.—There is an omission of the third prize in the Black Red Game Bantam class. It was awarded to Mr. T. W. Ams, 42, High Street, Clapham.

ROYAL DUBLIN SOCIETY'S WINTER SHOW.—Mr. Seale did not win his own cup. It was won by Mr. Zurlhorst with the best Blue-pied Pointer hen, and duly presented to him.

NAME OF BIRD (*Naturalist*).—The name of the bird you mention on page 502 is the Mountain Finch, Brambling, or Bramble Finch, as it is commonly called by bird-catchers in the neighbourhood of London; the *Fringilla montifringilla* of ornithologists.—D. BROWN.

### REMARKS.

23rd.—Fine forenoon, then rather cloudy; rain in the evening, and wind at night.

24th.—Fair and pleasant, but not bright though warm.

25th.—Foggy and misty in morning; fair about noon; fine evening.

26th.—Dull all day, with rain in the evening.

27th.—Heavy rain in morning; very bright sunny afternoon.

28th.—More or less fog all day, no sun, and very foggy at night.

29th.—Foggy in the morning, especially about 8 a.m.; finer afternoon, with some sun; fine evening, with lunar halo.

30th.—Fine morning; rather raw day, and sharp shower at night.

A week of very ordinary December weather, no remarkable extremes either of heat, cold, pressure, or rain; the temperature frequently just about freezing point, and repeated fogs.—G. J. SYMONS.

### COVENT GARDEN MARKET.—DECEMBER 31.

We have no alterations to report.

From observations taken near London during forty-three years, the average day temperature of the week is 41.8°; and its night temperature 30.1°. The greatest heat was 54°, on the 12th, 1852; and the lowest cold 3°, on the 13th, 1867. The greatest fall of rain was 1.00 inch.

## SAVING FUEL.

**PRESUME** that the modern compensating systems of heating, as applied to hothouses, have not been as yet so generally adopted as to have had much effect in modifying the fuel bills. To discard any boiler which has done, and is still capable of doing, good service, to give place to some of these comparatively untested inventions, is a matter which demands consideration, and even the recommendation of liberal compensation may not have the desired effect of introducing them into office.

The next question which is likely to prove of interest, and one worthy of being discussed, is, How best to economise with those appliances which are already in general use? Cheap, and therefore inferior, fuel is often advocated and used for the sake of economy. My own experience goes to prove that no saving whatever is effected through the use of such. Good coal or coke always contains and gives out the greatest amount of caloric, and in the end is the cheapest. We some time ago tried the dross, but what with inferior fires and a much larger quantity of refuse, we have resumed and will abide by the good coal.

I am of opinion that if economy is to be practised, its most effective form will be through the reduction of temperatures.

Low night temperatures for Vines have lately been much advocated in some of your contemporaries. A night temperature 10° or 12° above the freezing point for Vines very early in the season, and at a very tender stage of their growth, is said to have a very beneficial effect. Some Muscat Grapes I saw exhibited in September last had been grown under this arctic treatment, and certainly the livid sea-green colour was not salutary. Where early forcing in the true sense of the word has to be practised it can only be successfully done by some powerful stimulant, and that with the Vine means heat. No fruit-bearing plant under artificial circumstances is more susceptible of cold than the Vine. Any attempt at starving it is sure to end in failure. I never yet could mature Grapes at a given time, or indeed at any time, in a temperature continually below 60° at an advanced stage of growth; it is not, therefore, so much with the object of diminishing the heat for Vines that I wish to call attention to low night temperatures, but rather as regards the treatment of Pines and other exotics. I believe the fuel consumed for vineries throughout the winter and early spring months is small compared with that required to keep up the tropical temperatures which are frequently supposed to be absolutely indispensable for the well-being of these plants at all seasons of the year. It may be said one Pine stove does not exist for ten vineries; but for one viney started in the dead of winter ten remain inactive until the advance of genial weather, when fostering care nearly dispenses with fire heat.

The heating of large plant establishments is a serious consideration: some which I know would not only bear

with impunity but positive advantage a reduction of 10°, or even 20°, in the temperature at which they are at present kept. I am able to affirm this from practical observation. A boiler which previously did its work most efficiently, heating ranges exclusively devoted to Pines, Orchids, &c., by means of upwards of 2000 feet of 4-inch piping, had an additional range with 1000 feet more piping attached in October, 1872, and the circulation towards the first-mentioned ranges was greatly impaired, and the temperature of the interior reduced to a degree seldom, if ever, before attempted for such inmates. In cold weather (the place is much exposed) the night temperature of the houses for weeks in succession sometimes did not exceed 45°, and that of the day, with a few glimpses of the sun rarely exceeded 60°, that being the minimum and this the maximum from October to the end of March; yet of Pines there were numbers in various stages, principally succession plants of Smooth-leaved Cayenne, and there were, besides, a good number of the same variety in fruit; also a lot of Queens which showed fruit, as desired, in September. I never recollect seeing successional plants remain so dwarf, rigid, dark green, and healthy during the dull months of winter. Those bearing fruit did not swell it so rapidly or mature it so soon as they would have done in a high temperature; but how different the finely-developed plump-pipped fruit from those shrivelled or prematurely ripened in a high stewing temperature! The Queens, many of which did not ripen until the end of March or the beginning of April (a grand hit for the early season), were double the weight of those subsequently ripened in a high temperature in June. The houses are, as all Pine stoves should be, drip-proof. Moisture was, and required to be, very judiciously applied both at the roots and in the atmosphere under cool treatment. Pine-growers would do well to study the giving of water in any form at all seasons of the year. According to experience more rests in watering than attention to all the other requirements combined. Nothing is more injurious to the Pine Apple than supplying the plant with a quantity of water when a corresponding absorption or evaporation is not taking place.

In ordinary practice, to have Queens ripe by the beginning of May, a sharp start is necessary in January, when much fire heat is needed between those dates. It is now a matter of serious consideration whether it would not be attended with many advantages to start the plants into fruit in autumn, and grow them slowly during the winter, as above indicated, to meet the demand in May, and so avoid the roasting push which is often resorted to when ripe fruit must be had at that period.

Amongst the Orchids were many of the finest East Indian kinds, as well as species of nearly every genus. The whole not only retained their formerly healthy condition, but actually improved in the low winter temperature, as was evident from the stiff foliage, the still deeper shade of green it assumed, the numerous finger-like fresh roots which the plants emitted, and the profusion of bloom which they have since produced. Other stove

plants were equally luxuriant. To lower the temperatures without decreasing the care bestowed in cultivation would be no loss, but to lower the temperatures and raise cultivation to a higher standard of perfection is certainly a great gain. It was in contemplation in this case to keep the plants a little cooler in winter than they formerly were, but certainly not to the extent forced upon us; yet so successful was the treatment that the temperatures were again lowered for the winter, and no apprehension whatever is felt on entering a fine stove in the morning to find a nice sweet atmosphere and the thermometer indicating 45°.—M.

### LEUCOPOGONS.

I wish to direct the attention of the readers of the Journal to the claims the various members of this genus have to a more extended cultivation. I do not remember, during the whole of my gardening experience, having ever seen them grown to any great extent; and when the taste for New Holland plants died out, these, with many other beautiful greenhouse ornaments, suddenly disappeared, saving in the collections of those who were old-fashioned enough to love plants for their real worth and beauty quite independently of what might be the fashion at any particular time. I must confess being old-fashioned enough to love these Leucopogons, for they supply a profusion of snowy white flowers which are invaluable during the winter months. They bear cutting well, and I really know of nothing which is so tasteful for arranging in a lady's hair for a ball or dinner party. I always endeavour to cater for the fair sex in the matter of plants and flowers, and if my fair readers will only grow a few plants of the genus now under consideration they will always have, during the dullest season of the year, material for bouquet-making or head-dresses of the most chaste and beautiful description.

Leucopogons have been so much neglected that it is very questionable if one in a dozen, even of those whose business it is to know plants, have an idea of the truly beautiful objects they are when well grown. They will not conform to crinoline training like an Azalea, but with a little management they form compact handsome shrubs, which in winter are laden with clusters of snowy flowers of great beauty. They belong to the Epacrids, and as a genus are distinguished by their funnel-shaped corolla, which has five spreading lobes; these corollas being seated in a five-lobed calyx, furnished at its base with a few dry chaffy bracts. The anthers are five in number, situated on short filaments included within the corolla; whilst the style is furnished at the apex with a capitate stigma, and gradually increases in size down to the base. The fruit is usually a berry, but this will not be an object of decorative utility. The flowers are white, borne on terminal and axillary spikes.

The cultivation of these plants is quite simple, and they may be grown by those possessing very little glass-house accommodation. One thing, however, is essential to their well-being, and that is an abundance of sun light. The soil should be about two parts good peat, one part light loam, and one part sharp sand; the whole should be well incorporated, and used when in a nice friable state. It used to be held as an infallible maxim that Leucopogons did not like or require much water, and so, forsooth, we hear it said now very often respecting Ericas; but my experience goes to prove that both genera like a plentiful supply, but the drainage must be perfect, so that nothing stagnant nor sour remains about them for an instant. After flowering, and before growth commences, the plants should be cut back to within some few inches of the old wood, but upon no account should they be pruned too hard. To avoid repetition it will be well to observe that the flowers are all white, and the limb of the corolla is more or less bearded with white hairs, hence the generic name. The following few kinds are amongst the most desirable, and are well deserving of careful attention at the hands of all lovers of winter-flowering plants.

**L. RICHIEI.**—This species is tolerably plentiful on the mountains of Tasmania and New South Wales, where it attains a height of 4 or 5 feet, and assumes the proportions of a handsome shrub. The leaves are oblong-lanceolate, of a smooth and shining green, which contrasts beautifully with the snowy flowers that are produced on axillary spikes, continuing in perfection for several months during the winter and spring.

**L. LANCEOLATUS.**—Like the preceding this plant blooms during winter and spring, but in addition so profuse is it that strong plants often continue well into the summer before the

last of the flowers pass away. It naturally attains a height of from 6 to 10 feet, but I have seen it flowering when about the same number of inches high. The leaves are lanceolate and dark green; the flowers borne upon axillary spikes and pure white. Native of the mountain districts of New South Wales.

**L. TAMARISCINUS.**—This is a very handsome species. The leaves are ovate, smooth, and dark shining green; flowers produced upon somewhat dense spikes, and in great profusion. It continues in beauty throughout the winter months. Native of New Holland.

**L. AUSTRALIS.**—This is the last I shall enumerate, although there are many others deserving a place in large collections. It attains a height of some 3 or 4 feet. The leaves are lanceolate, long, narrow, and dark green; spikes many-flowered, axillary, and produced during the whole of winter. Native of Tasmania, &c.—**EXPERTO CREDE.**

### VINE CULTURE.

THERE is one period of the year when I think Vines planted in inside borders are not treated rationally, even by many whose cultivation is otherwise faultless, and to this I attribute many of the evils complained of during such a trying summer as the past.

As soon as the fruit is gathered the borders should be thoroughly examined to see whether they require water; never mind injuring a few roots, it is better to do this than allow the whole to suffer, and, moreover, the Vine will bear its roots being cut, and in many cases this is beneficial to it, inducing it to emit feeders more at home.

It is quite a mistake to suppose that the roots of Vines, or indeed plants in general, should be kept dry during their so-called resting period; they are never really at rest. I believe the nearest approach to rest in the roots of Vines is just at the time the buds are bursting into leaf; there is no visible sign of growth in them till some of the leaves have grown to their full size. The exact time when root-action commences can be told to a nicety by noticing the colour of the leaves, which is of a very light green at first and remains so for some time, when suddenly on the forwardest and healthiest plants patches appear which are almost blue, and gradually mingle with the lighter colour, and all is changed in a few days to the beautiful lively green so natural to the healthy Vine. When this bluish colouring matter first appears is just when the plant has begun to make use of its roots. Although a large plant may have made sufficient leaves to cover a quarter of an acre, it has had nothing to do it with besides what was stored-up in itself till such time as the leaves began to assume a darker colour, and then it would begin to draw fresh supplies from mother earth.

Bearing this in mind, it is reasonable to suppose that the roots have much to do in the autumn, and practically this is found to be the case; the roots are quite fresh and seemingly active long after the leaves have put on their autumnal colours, and I believe that as long as a leaf has any hold on the stem the roots are busy.

All this I consider of the greatest importance to the cultivator. There are seasons when he cannot water his plants, notably when the ripe fruit is hanging on them, and without doubt they frequently suffer at this time, for the evaporation going on is something enormous in warm dry weather; but this can be remedied to a certain extent by giving abundance of water just before colouring, and again, if necessary, after the fruit is gathered. As far as my experience goes, with a well-made border it is always necessary to water in autumn or winter.

Another lesson to be derived from the facts I have mentioned concerning root-action commencing in the Vine after the formation of the first leaves, is not to apply too high a temperature till it can be seen that the roots are actually at work. Not that I would start with a very low temperature. I commence with 50° to 55°, and do not exceed this for ordinary Grape-growing—I am not writing about forcing—till the flowers are set. Muscats are no exception; mine are often below 50° when in flower. Flowers formed in a comparatively low temperature and with continual ventilation have shorter and stronger flower stalks (bear this in mind, my friends who are troubled with shanking); the flowers are more perfect in every way, the quantity of pollen produced is something marvellous compared with that produced in a higher temperature. A greatly-respected octogenarian in company with one of our

worthy Editors actually asked last summer if I had been troubled with mildew, the pollen that had fallen on some leaves of Lady Downe's looking in the distance exactly like sulphur.

Although I recommend the same temperature for Muscats as for Hamburghs, I do not advise them to be grown in the same house when it can be avoided, because they flower and ripen at a later season.—W. TAYLOR.

### JUDGING ROSES.

In answer to the appeal made in the Journal on the question of the presence of Tea Roses in a stand, will you permit me as one who has now for a great many years had the privilege of acting as a judge of Roses to give my view of the question? I have never considered the presence of Tea Roses in a stand added anything to its value, and for these reasons—

1. I am set to judge the twenty-four (let us say) best Roses, and my object is to ascertain which are the best Roses of the kind exhibited; whether, taking two stands, there are more really good Roses in the one than in the other. I do not think that I am called upon to consider whether I like a pink Rose better than a crimson, or a yellow than a rose colour, or a Tea than a Hybrid Perpetual, but whether, knowing the sorts, those exhibited in one stand are finer, fresher, and more perfect than in the other. I have frequently seen one stand where great faults were committed in matters of taste—putting too many of one colour near to one another, or placing a small flower where a large one ought to be. But I have ever held that even taste in putting-up is subordinate to quality of bloom. In the same way I have seen a box where the moss was perfection and the blooms at first sight caught one's attention, and another where it was indifferent; but again, to the perhaps intense disgust of the owner of the first box, I have stuck to my rule—quality of flower, and not the accessories.

2. The alleged difficulty of getting good Tea Roses is one more dependant on climate and situation than on anything else. Our friends in South Devon would not have the same difficulty of growing them as those in the midland and northern counties. An amateur who has a walled garden can grow them better than one whose garden is open; and therefore I do not think a man who is thus favoured has to get an extra mark because he has a favourable locality in which to grow his Teas. And were we to enter into such questions we should want to know who had a good Rose soil or who had not; whether an amateur lived on the top of a breezy hill or in a sheltered nook; and therefore I think the best and safest rule is to take the Roses as they are, and let the finest and best win.

The difficulty which some of your correspondents have felt about their breakfast on the morning of the Rose Show at the Crystal Palace is one which can easily be met. If they will go out of the main entrance and cross over to the high-level station of the London, Chatham, and Dover Railway they can get anything they like. As to Kensington, that *inhospita terra*, the nearest port of refuge is the Museum. The only drawback there is, that as the shows are always held on Wednesdays, it is one of the days on which you cannot get in without paying.—D., Deal.

### TO YOUNG GARDENERS ON RENOVATING OLD FRUIT TREES AND OTHER SUBJECTS.

I THINK there can be nothing of greater importance to a gardener at any time, but especially when taking to a garden which has been neglected, than having a well-grounded knowledge of what is required and what can be done with old and somewhat exhausted fruit trees. Many a young gardener has regretted the folly of making a hasty condemnation and clean sweep of all trees of any considerable size existing in his newly acquired situation. What is the result? The supply for some years cannot meet the demand. Should the employer be a consenting party to the wholesale destruction—in some instances he is really the instigator—yet in a little while when there is no fruit, or but little, he forgets about that, and the gardener alone is held accountable. The stream of discontent once set running, it is sure to swell with other grievances whether real or imaginary. It is best at all times to avoid this if possible. It is apt to be said, "We used to have such and such fruit." (N.B., Cooks can do this nicely—quality is nothing to them if the quantity is little). It is enough for a young gardener to feel disgusted at the malformed trees and the cracked disfigured little fruit, after being accustomed to fruit of large size and

perfect shape, not to speak of well-trained trees. I can quite understand the ambitious feelings that will at once spring up under such circumstances in a young gardener who wishes to excel; but it is best to be on the safe side, and rather than make a sweeping clearance I would strongly advise the adoption of a more gradual course—to feel, as it were, the way. To make a grand sweep of good, bad, and indifferent before consulting the requirements of the house, or knowing whether it is possible to replace the trees with better varieties suitable to the locality, is a matter of the greatest importance. To replace an indifferent fruit tree with a really bad one, or worse, to have no fruit whatever, will bring down from all quarters the most disagreeable consequences. Can there be a greater pleasure or a more noble and interesting pursuit, to say nothing of its practical bearing, than to bring back a deformed and somewhat exhausted tree to youthful vigour and fertility? I maintain that this in all respects is more creditable and of greater utility than replanting, where there are trees of a proved variety which is known to suit the situation.

On producing a crop, should the sample of fruit be indifferent as to size and appearance, and the trees vigorous and healthy, in displacing them for fruit of a nobler character, I repeat we may replace proved sorts unknowingly with worse. To grub-up a tree and plant a nursery tree instead, as is too often done now-a-days, is a mistake. I have often seen grand trees wantonly cast away in order to make room for a young tree that must take years before it produces the crop which the old one would do with a little judicious treatment. We are apt to look at a tree which has got to the top of the wall, for instance, unless it is a model of training, with an eye of contempt—as an eyesore which must be destroyed at any cost. We ignore the fact, that when in a bearing condition there will be as many basketfuls on it as there will be single fruit on the young tree in the same period. When we have a large tree with a good constitution we can at once place half a dozen young trees on its head, and in the second or third year have the whole well furnished with fruit. I do not think I am without the bounds of truth when I state that in many instances there is a long and vexatious scarcity of fruit, owing to the erroneous idea that it can only be obtained by replacing the old trees with others subjected to more modern treatment. It is undoubtedly in many instances a great mistake not to attempt renovating neglected trees, in others they must undoubtedly make room for young subjects; but which course should be adopted in each particular case must be a matter of judgment, which can only be decided upon by one on the spot.

I will now rather deal with the best means of treating a tree that it is deemed necessary to renovate; and in laying my ideas before your young readers I can assure them that what I shall state is the result of long study and close observation, by one whose natural taste is for gardening, and whose experiences commenced with infancy, under an enthusiastic fruit-growing parent. "Ah!" some will say, "he is evidently one of the old school." Not exactly, nor of the new, but I have great faith in the natural. I am not an admirer of the careless grow-as-they-like system. Nothing seems more out of place in a gentleman's garden. Late in I visited two large establishments in which all fruit trees, except those on the walls, were left to grow at will, and certainly they produced immense crops. In an outside spot, as an orchard, no one would complain of them, but where everything is kept with mathematical exactness we look also for the gardener's skill being brought to bear on the trees. I happened to call again at one of these gardens, and a young man had taken charge. These trees were all cast away, and young ones took their place, but the sequel was he had to go himself. Apples could be carted away like Swedes from the field—and then to have none! It was out of the question. No one can deny that it is a great advantage to have these big trees, either in a quarter of the garden, or, better, in an orchard. Without them the basketful after basketful of fruit needed in many establishments would seldom be forthcoming; but if planted indiscriminately they are out of place in a well-kept garden. The tendency of to-day is towards the opposite extreme. A deformed pigmy fruit tree, of a foot or two high, loaded with eight or ten fruit, is pretty enough in its way, but how many such will it take to supply the house a week? There is in their case no pick-and-come-again. The legions of whimsical geometrical-trained fruit trees is only equalled by that of the numberless patent forms of miniature glass buildings. They are well enough after there is sufficient of the more substantial necessities. Their place is simply to

form an auxiliary; to rely on them solely is an error that cannot be too studiously avoided.

Utility must ever be the pass-word in the fruit and vegetable garden, and infuse ornamentation when it does not interfere with utility. The torture to which fruit trees are subjected on the Continent, and which some too enthusiastic admirers on this side of the water would have us believe to be the perfection of training—has not this been proved to have eventually a very detrimental effect on the well-being of the tree? It has been proved over and over again—to wit, with the Azalea and many other subjects—that there are certain bounds beyond which nature cannot be forced with impunity. I ask, Where is the great bulk of fruit that fills scores of fruit-rooms grown, supposing that there are hundreds of these fancy-trained trees, also an orchard of more natural character, but not neglected? My experience, and I believe that of most others—especially with Apples—will answer in favour of the orchard. Pigmy-trained trees are playthings for the owners of many small gardens, who derive more pleasure in occupying their time in training than from the quantity of fruit produced. To many again—and I share their idea—nothing seems to be a fruit tree unless they can hide themselves amongst its blooming branches in spring, and have a store of fruit at Christmas. What is wanted now-a-days is a maximum of fruit for a minimum of labour. We have now to contend with aere after aere of dressed ground, and thousands upon thousands of bedding plants, the ever-wanted cut flowers, to say nothing about an abundance of tender vegetables, and all this with a minimum amount of labour. It is consequently impossible to pay that attention to the repeated pinching, lifting, training, mulching, and the like, that must be attained to in order to attain any degree of success.

I am well aware that many who have a thorough training think it not beneath their attention to study out-door fruit culture, and will not commit themselves; but too many by half think if they can run-up a long list of long names they are at once gardeners. Young men, depend upon it, it is a grave mistake. A plentiful supply of fruit is an absolute necessity, flowers notwithstanding.

Now, where are those who never did a day's work with trees to learn about out-door fruit-growing? It is no mere fancy that there are such. I have worked under and with many young men who confessed to never having done so. There are many books on the subject, and from them their knowledge is obtained, but the books of modern writers seem to me to be written wholly for one end; they treat, from the beginning to the end, on young trees—nursery trees—of various shapes. The young man who studies such books will most naturally, unless he has had some practice in renovating neglected trees, proceed to destroy all to make room for the many fancy forms he admires on paper. I believe that it is seldom he gets an opportunity of realising with living trees the pictures which he admires. I do not assert there is nothing to be learnt from these books, but it is well to be able to judge of what is right by having a knowledge of what can be done in other ways. If I were to put into the hands of a young gardener a modern treatise on fruit culture, I would at the same time give him one of an earlier date, for instance that of Forsyth. There is in it no doubt some absurdity, but cannot the same be said of modern books in a more marked degree? Although it is upwards of seventy years since Forsyth published his work, it contains much sound knowledge that has not been improved on, and holds its own against newer ones, which seem to be written for the villa garden rather than for large establishments. Forsyth was a great man with me in my boyish days. Those beautiful, large, clean-skinned fruit, produced on the young branches in his faithful illustrations, compared to the small shabby tasteless fruit from the old scrubby branches—the quality and quantity on the former compared to the latter, were my delight to verify in growing trees. Especially do I remember a large well-trained Glou Morceau Pear tree, and the six or eight splendid fruit at the extreme end of each long branch, compared with the few small indifferent fruit located from their back to the stock. The question that suggested itself to my mind was, Why not have more of these vigorous two or three-year-old branches like the extremities bearing the fine fruit? It was with intense gratification when gathering fruit day after day that I noticed the difference between fruit growing on old and young wood. I always knew where to find fine, clean, high-coloured fruit. What benefit one derives from learning to think in boyhood! It helps one to overcome difficulties; it gives one more confi-

dence as to what will be the results of any particular operation. In a word, he gets the physical nature of the tree so well at heart that, like the practical physician with a sickly person, he sees at a glance if it is possible to regenerate the patient. It is, therefore, a great point in gardening—one to which young men should pay great attention—to learn when and how art can step in at the right minute to help nature, and to supersede her if it can.—J. TAYLOR, *Maesgwynne, S. Wales.*

#### NEW AND IMPROVED BOUQUET-HOLDER,

MESSRS. DICK RADCLIFFE & Co. have sent us the engravings of a bouquet-holder. It is made in electro-gold, is not only

a very handsome holder for a bouquet, but also answers the purpose of a stand for flowers.

#### STRAWBERRIES IN WINTER.

At this season of the year, what is there nicer to put upon the dinner-table than a good dish of Strawberries? I grow Keens' Seedling for early use, President, and Sir Harry. These are too well known to need description. I am well aware that they are old varieties, but as croppers and for flavour they are all that the most fastidious could desire. I always select as many of the first suckers as I shall require—they make the strongest plants—and all the other suckers I have cut off as they appear, which is a great consideration in the successful culture of the Strawberry in pots. I never allow superfluous suckers to remain. I pot each sucker in a small 60-sized pot, which I fill with rich compost—namely, good fibry loam and decayed dung, and I place a small stone on the stem to keep it in its place. Very soon the pot is full of roots. I constantly use liquid manure, and give them every encouragement; the more liberal the treatment the greater will be the results when fruiting. When the pots are full of robust roots the plants are separated from the parents.

I usually give the plants about three shifts. I never allow them to become pot-bound, and as they are repotted I place them in a warm position, where they are exposed to plenty of sun and air; each pot is placed on a flat brick, and plunged in ashes up to the rim, every precaution being taken to keep worms out. For the final shift for fruiting I use 24-sized pots, and I also pot very firmly, using a compost of fibrous loam, decayed dung, and crushed bones, with a good sprinkling of charecoal.

I have tried keeping the plants in pans when growing. I have seen decayed manure put in the pan, also water, but I do not like either. I always have the best success by pursuing the following method: I have turf cut out of a pasture, and placed bottom upwards—the grass on the shelf, the soil upwards. I place the pots on this; and when starting, the plants root into the turf and receive great support from it. When I water I give plenty on the turf. Many failures arise from giving them too strong heat when starting. I have seen them, after they have made their growth, placed on their side to keep them dry. I always place mine in an orchard house during the period of rest.

I have kept some plants during winter, and not fruited them till the second winter; they always repay me for the extra trouble. I call them two-year-olds. It is a very easy method; I pick off every bloom bud as it appears. The result the second winter is superior. In the autumn of 1872 I took up fifty plants out of a Strawberry plantation several years of age as an experiment, and from them early this year I had a capital crop, and at any future time if short of plants I should do so again. The red spider is the great pest of Strawberries; all

that is required to keep it away is the syringe used very freely.  
—F. P. LUCKHURST, *Mill Bank Hall*.

## ROYAL HORTICULTURAL SOCIETY—VOTING BY PROXY.

WE have received two printed circulars asking the Fellows to give the power of voting by proxy at general meetings of the Society. We have on a former occasion warned the Fellows against giving that power. It always causes more injury than it effects benefit. It has always been found that those in authority, having the funds and officials to work with, are enabled to obtain proxies from Fellows residing at a distance much more readily than any opponent of the Council, who has to apply for proxies individually and at his own expense. No Fellow should have the power of voting on any motion without having heard the arguments urged on both sides. The House of Peers have resigned the privilege of voting by proxy because it was known to operate wrongfully; and we know of no reason why the Chairman of the Royal Horticultural Society's Council should be able to say, any more than a Prime Minister, "Let the opposition argue, I have the majority in my pocket."

IN reply to "A LIFE FELLOW," a reference to the manuscript of my letter of Dec. 25th will show that it suggested that it would have been better if the first words of the "appeal" had been, "The old Council was caused to retire by a very small number of votes, and most of them local ones." I did not propose to alter "A LIFE FELLOW'S" letter. I gladly, however, join issue with him on the question of fact whether it was a large or small number of votes which caused the late Council to retire. In your report of the meeting of March 26th, 1873, in the number of 27th March, 1873, Mr. Lindsay (page 256, second column), says, "It would be in their recollection that the circumstance which had led to these proceedings was at the last annual meeting, the vote for the non-adoption of the report was carried by a majority of 86 to 11; the Chairman then stated that he did not see how it was possible for the Council to take any other step than resigning." Eighty-six, mostly Kensingtonians, to fourteen horticulturists!—this on the authority of the Secretary of the present Council at the annual meeting of the Royal Horticultural Society, which numbers some 3500 Fellows; and "A LIFE FELLOW" considers that the old Council was not caused to retire by a very small number of votes, and those mostly local ones! Continue the reference to your report, and it is stated (page 258), that on Mr. Lindsay's amendment to prevent men's proxies, 107 voted for and 53 against, and that ladies' proxies were 225 for and 206 against. The numbers given in the *Gardeners' Chronicle*, published on the 29th, and therefore with more time to get the exact figures, are—"For amendment by show of hands 109, by proxies 116; total, 225. Against, by show of hands 53, by proxies 151; total, 207. Majority for the amendment, 18." Further on in your report, the bye-law permitting the Council to resign was voted for by 93, against 23 and 37 proxies. Majority for the bye-law, 33. "The supporters of the bye-law did not use proxies."

What I said is, that without starving horticulture I believe that the Council cannot pay the rent, £2400 according to the charter, when due, and I repeat it.

"A LIFE FELLOW" hardly sees the point in my answer to his comparison of the Zoological and Botanical Societies with ours. What I said was, that the Crown being the landlord of the houses round the Botanic and Zoological Gardens received on their increased rental a large rent for the space occupied by the Gardens. The Crown is not the landlord of the houses round South Kensington Garden, and the land having been bought mainly out of the people's shillings, it seems an abuse that the rich neighbourhood should not pay a rent approaching to its value if kept private—this to be applied to public purposes—or that greater public use should be made of the gardens.

"A LIFE FELLOW'S" last paragraph I do not understand. If he means that I supported the proposal adopted by the late Council to admit Exhibition visitors to the garden on consideration of freedom from £2400 a-year rent and £2000 a-year debenture interest, and of an estimated £1000 a-year for horticulture (the settlement with life Fellows being understood), I fully admit this responsibility. I think this arrangement would have been a fair compromise. It would not have taken away very much of the privacy of the gardens from the Kensingtonians; it would have made some greater use of the land,

and would have given some money for horticultural objects, besides freeing the Society from much of the load which weighs it down. I fear that "A LIFE FELLOW'S" Kensingtonian friends may regret the day that they prevented terms like these being carried out, and doubt the new Council's will and power to "sell the Society to the Commissioners" on better terms.  
—GEORGE F. WILSON.

## ABOUT ROTHBURY.

IF the question had been asked some twenty or thirty years ago, What about Rothbury? the answer would likely have been that it is a village of no great importance in the centre of Northumberland; and if the inquiry had been made at an earlier period, it might have been said that its claims to respectability were of a somewhat questionable character. The tongue of slander used to say unpleasant things about Rothbury—not that it differed much from other villages, but the circumstance of its situation gave it a sort of claim to notoriety. It lies at a considerable distance from any other village of importance, and necessarily exercised a considerable influence for good or for evil over a wide district. It was here that the unfortunate Earl of Derwentwater and his adherents raised the standard of rebellion against the present ruling family of the country, and proclaimed a member of the exiled Stuarts as the Sovereign. The issue of that ill-starred rebellion is well known, and the wide domains of the unfortunate nobleman were forfeited to the Crown on his perishing on the scaffold. Sympathy for him, it need hardly be said, was long felt in the neighbourhood, where his good qualities as a landlord and a kind and indulgent master were widely known; and this sympathy no doubt led many to couple his case with that of the family for whom he sacrificed his life, and consequently in Rothbury and other places the people long maintained a hope that the cause of the Stuarts was not altogether desperate. Border songs and popular tunes breathing a wish of the kind were common enough in the younger days of people still living, although it does not appear that the Derwentwater property extended to Rothbury, the seat of the family being a good many miles away; neither does it appear that the claimant for the broad acres it once possessed, whose case occupied so much attention a few years ago, ever found much sympathy or support at Rothbury, although she met with it elsewhere.

To those intending to visit this once out-of-the-way village a journey on horseback or some primitive conveyance was necessary, and that not long ago. Now, however, that pioneer of civilisation, the railway, takes the traveller to the very place. A single line of rail branching from the North-Eastern line at Morpeth carries the passenger over some twenty miles, more or less, of uninteresting country. This term, however, would not be applied to it by the antiquarian, for objects of interest present themselves at various points on the way. First of all, while changing trains at Morpeth the town lies before him in a valley on both sides of the river Wensbeck, the railway station being much elevated above the town; in fact the district around Morpeth is very hilly, and crowning an eminence but a short distance from the station are the remains of Morpeth Castle, a stronghold in the border frays, which extended almost down to the union of England and Scotland, when most dwellings of any importance bore marks of having been fortified in some way. The Castle has evidently been one of importance, though not more so than another we catch a glimpse of a short time after leaving Morpeth. This is Mitford, once the stronghold of the Bertrams, a noted family in border warfare, and their family seat is of course mixed up with their history. Other fortified houses, as Ogle, Belsay Castle, and Letter Harle Tower are too far from the line to be visible to the traveller; but ere long he comes in sight of Roadley Castle, placed on a ridge of some elevation, but I believe the structure that now presents itself to the spectator is more of a sham than a real ruin, and its history is unimportant, while the aspect of the country is not inviting. By degrees this becomes wilder, and now and then glimpses of distant hills reveal the fact that we are approaching a moorland district; at a station a short distance from Rothbury the train stops, and looking out we find the name of one of the gentler sex is posted-up as ticket-collector, and very gracefully she performed her duties, informing us in reply to an inquiry that the remains of the famed Brinkburn Priory are some three miles off. But the train proceeds, and curving round the steep sides of a hill, the summit of which is in its primitive wildness, it pulls up at what is at present the ter-

minus, and the village of Rothbury is not more than a couple of stonethrows from us, but on the other side of the river Coquet, a stream which at this point seems to contain as great a volume of water as the Thames at Richmond. The river, the village, and the mansion are all seen to the best advantage from the railway station.

Perhaps there is nothing which marks the difference of ideas between the denizens of the north and their brethren of the favoured south than the manner in which they speak of the respective features of the country. In the north every river has its praises recorded in the popular songs of the neighbourhood, the Tweed and Clyde being especially rendered the burden of many a song; while Tynedale, or the tract of country drained by the river Tyne in its upper reaches, was noted all over the kingdom for the hardy and skilful class of bowmen it sent forth to foreign as well as border warfare. The efforts of the poet have not been wanting to sound its praises as a river, but I believe in the latter respect it would have to give place to the Coquet, the most important river in central Northumberland, as the Tyne is in the south of it. This noted river has its origin in the ridge of hills which forms the boundary between England and Scotland. The course of the stream before reaching Rothbury is through a valley of great width, and of proverbial good quality as farming land, the corn crops at the time of my visit (towards the end of August), being more advanced than at many places two hundred miles farther south, and excellent. The river, as may be imagined, takes a serpentine course through this flat district, but on nearing Rothbury the valley diminishes, and indeed the river is hemmed in by high precipitous banks with but little land on either side that is available for cultivation; the village, it may be stated, is on the left bank, and the wild moor rises to a great elevation almost from the backs of the dwellings. In fact, it is in consequence of this place forming a sort of resemblance to the more distant highland scenery that Rothbury at the present time derives its importance; for at the back of the village is the moor in its full garb of hundreds of acres of Heather, which at that time was in full flower, and intermixed now and then with stunted Birches in some places and Willows in others, while more important than all were the huge masses of fixed and detached rock. Some of the latter were of large size, approaching that of a moderate-sized haystack, others such as the traveller could throw as easily as a cricketball, the whole, I believe, being a freestone of excellent building qualities, and which if placed near a large town would make a fortune to the owner. As it is, the buildings in Rothbury, old and new alike, are constructed of it; and although the weather-beaten surface of these huge masses presents the usual grey tint given by the Lichen, the stone when broken much resembles Bath stone, and appears to be more durable. The older houses in Rothbury present an agreeable pale-grey tint, while the newly-erected ones are of a bright stone colour. Some of the oldest dwellings have the familiar heather thatch once common in moorland districts, while their newer neighbours are roofed with blue slate; the timber-framed houses of the south and west of England has no place here. Trees seem to be confined to the district immediately bordering the river.

The immediate cause which called an obscure country village into celebrity was the great salubrity of the place, and the advantages it presented of providing the densely populated district of the lower Tyne with a sort of highland outlet, and both the working classes and their employers have taken advantage of that. Excursion trains run from the great towns on the Tyne and Wear, carrying their thousands of pleasure or health-seekers for a day's "outing" on the moors, and who return with bunches of Heather as tokens of having been to such a distance; while for the more wealthy, ample accommodation has been provided in the shape of monster hotels. The ascent of the hill is an exhilarating pastime to the sedentary townsmen, and the pure air and other advantages add to their enjoyment.

Nor is the district without its charms, the river after it passes the village is still further hemmed-in by high rocks, and at one place its whole bed seems a solid impenetrable rock, with not a particle of moveable matter upon it, and at one particular place while the ordinary bed may be 100 feet wide, or more, the whole stream is confined in a narrow chasm of not more than 7 feet wide, through which it rushes with great impetuosity. A foot-bridge has been fixed over this natural curiosity to prevent the accidents that were said to have now and then occurred by reckless persons attempting

to jump over. Lower down the river the banks are densely wooded for some distance, the old Priory of Brinkburn being embowered in wood, and tradition says, a body of foraging borderers were unable to find it, when its inmates, unfortunately for themselves, attracted them to it by ringing their bells in thanksgiving, as they expected, of having escaped the pillaging visit, which, as it was, ended otherwise.

Other places of note border the river, but the great attraction to visitors is the bracing atmosphere, and the ascent to the top of the hills reveals other distant tracts of a like kind. Simonsides, a somewhat higher mountain lies to the west of it, and on the opposite side of the Coquet, while several miles away are the renowned Cheviots, which form the north-western boundary of the county, and which occupy so prominent a position in the history of the two countries, as being the scene of many a bloody battle, the most remarkable being that of Flodden, where James IV., of Scotland, and the flower of his nobility perished. The vestiges of a camp of much earlier date than that of the famed battle are at one end of the village.

Like most other places of recent growth, which owe their progress to some presiding genius, Rothbury is indebted to one whose name is known all over the civilised world. Sir William Armstrong, the great engineer, whose guns and their projectiles seem destined to alter in a great measure the character of future warfare, has here erected a mansion, which is very appropriately named Craigside, a spacious-looking dwelling snugly ensconced in one of those recesses often met with in a mountainous country, the site being at the base of two hills meeting at right angles, one facing the south the other the west. A considerable tract of fine land tolerably level lies between the mansion and the river. Part of this has been formed into a kitchen garden with forcing houses, and other parts running-up to the waste behind the mansion are kept as dressed ground, and the whole, including a large portion of the former moor, has been enclosed by a formidable wall, which I found was sealed against intrusion. Doubtless, there are good reasons for this, but being the first case of the kind I have met with, I simply mention it, and can give no details of the garden beyond that. I believe most things were found to thrive remarkably well, as, in fact, most plants do in fresh soil, more especially when that soil happens to be at the base of an elevated range of freestone mountains. Not only will Rhododendrons and other American plants do remarkably well in such a position, but most other kinds of trees and shrubs—Vines especially. I think the place had only been established a few years, and from what I could see of it from the railway station, it had all the appearance which great wealth usually commands. Though the right bank of the Coquet on which the mansion looked-out presented the wild character of highland scenery of moderate elevation—naked rock and detached stones grey with age contrasting well with the purple Heath—there was in another direction ample breadths of well-cultivated valley, with excellent crops of corn, &c. The hill against which Craigside is built is one of those detached hills of, perhaps, only a mile or two across, and separated by a like extent of valley from others, and it is a greater distance from the Cheviots, in some secluded glens of which the snow is said to lie all the year round. There is enough of moor at Rothbury to tire most ordinary pedestrians for one day's travel, and Heather enough to allow a good many excursionists a handful each to carry back with them to their densely populated towns.—J. Ronson.

#### PTERIS TRICOLOR.

In reply to Mr. Pocock's note, I have to say that I do not grow *Pteris tricolor*. My Fern-growing conveniences are limited, and my object is to cultivate only, or mainly, Ferns from which I can "cut and come again" for decorative purposes—as mixing with flowers in rooms. I am, however, well acquainted with this beautiful Fern, and have tried my hand at it with fair success, at a time when I had a pride in attempting to conquer all stubborn and "niffy" subjects.

My treatment was very similar to that detailed for *Adiantum farleyense*, with the exception of somewhat firmer, more loamy soil. The best-coloured specimen I ever saw was grown by a farmer's "odd man" in pure silky loam and silver sand. On the Continent I observed it luxuriating in simple leaf mould, but this medium is, as Mr. Pearson says, very capricious. Most kinds of leaf mould are vastly improved by a search, and this, furthermore, is the best preservative against worms in pots.

Mr. Pocock has given some capital landmarks on the cul-

ture of stove Ferns. Like Cinerarias they never do so well as when moisture rises regularly and freely from below, and when the pots look misty the Ferns grow freely. Another important point is to use water at a regular temperature, say 5° above that of the house. The use of water without proper regard to its temperature is fraught with immense danger, especially in the case of plants of sluggish growth, and those liable to the attacks of insects.—OLD FRIEND.

### ALPINE PLANTS FOR SPRING BEDDING.

Mr. D. THOMSON'S interesting letter containing most useful hints on alpine plants for spring bedding, leads me to send you a list of plants in a narrow winding border forming the lower tier of a rockwork, which at this season have a pretty effect here (Weybridge, Surrey).

I must premise that the Mossy Saxifrages are in large clumps, and most of the other plants strong ones.

Saxifraga nervosa	Saxifraga longifolia
Primula altaica	Primrose
Saxifraga glacialis	Saxifraga hypnoides
Primula auriculiflora	Primrose
Saxifraga atro-purpurea	Saxifraga nepalensis
Primrose	Primrose
Saxifraga altifida	Saxifraga pubescens
Primrose	Primrose
Saxifraga palmata	Saxifraga serratifolia
Primrose	Primrose
Saxifraga Andrewsii	Saxifraga trifida
Primrose	Primrose
Saxifraga elongata	Saxifraga umbrosa regilops
Primrose	Primrose
Saxifraga cochleata	Saxifraga geranioides
Primrose	Primrose
Saxifraga adscendens	Saxifraga Geum polita
Primrose	Primrose
Saxifraga marginata	Saxifraga hypnoides ice-
Primrose	landica
Saxifraga irrigua	Primrose
Saxifraga pyramidalis	Saxifraga serratifolia
S. sponhemica [hypnoides?]	S. Haworthii
Primula altaica	S. Geum variety

—GEORGE F. WILSON.

### CARTER'S ROUND-LEAVED BATAVIAN ENDIVE. EARTH-BLANCHING.

This is a winter-salad vegetable of great excellence. Sown in July it has afforded a supply for winter use which is especially esteemed. In growth it is particularly compact, less leafy than many other Batavian Endives, and consequently more edible in heart and midrib. Dug-up in November when perfectly dry and the outer leaves carefully folded, it was buried, root uppermost, in the south slopes of Celery ridges, and a month afterwards, and onwards, it turned out in fine condition, white as milk, crisp as anything could be, sweet as a nut, and with no decay saving in the very outside leaves. By this simple mode of blanching, anyone having a garden may have a salad at Christmas that will add to the appearance of any festive table, and be as good as it looks. Of course, it is equally good under Mushroom-house and other modes of blanching, but the main object of this note is to recommend a plan, far from new, but easy and effective.—W.

### KEEPING GRAPES IN WINTER.

THOUGH our experience with the Grape Vine is none of the most extensive, and though our editor, after asking for the ideas and experiences of correspondents on this subject, goes to the bottom of the matter himself, the following notes on the subject may not be altogether unacceptable.

We are fully convinced that large and airy structures are, for various reasons, better adapted for both fruit and plant culture than those of less dimensions. The main point in which large houses are superior to small ones is their capability of containing a large volume of air, which with ordinary attention may be kept in a more equable and healthy condition for the growth, ripening, and keeping of Grapes than it is possible to do with contracted houses. Still, while first-rate examples of Grape-growing may be found in small structures, very poor results may also be found in large houses, though, doubtless, the management has nearly everything to do with it. None of the vineries we have to produce Grapes from are either wide or lofty, the late one being only 10½ feet in width,

height at back 11½ feet, and at front 6½ feet. We had occasion to do a little improvement in the border this autumn, and found that from the surface to the subsoil of iron sand, on which a layer of brickbats had been placed for drainage, it was only 2 feet in depth; and that a little rain which fell during the time a section of the border was open caused 2 inches of water to rise amongst the drainage—if it may be called such. It was not surprising, under these conditions, to find all the roots down in that particular stratum entirely killed. The heating power is measured by a flow-and-return 4-inch pipe, and there are plants grown in the house the whole year.

Our ideas with regard to the general management of late vineries are that there is generally too much water thrown about, even in the height of summer, and too little applied to the roots. Nor are we any advocate for giving unlimited ventilation when the Grapes are ripening: our plan is to give air according to the state of the weather, rather inclining to keep the air circulating amongst the fruit very warm than to allow the temperature to fall for the sake of a rush of air constantly playing through the vinery. We are of opinion that to perfectly finish Muscats to the highest state of perfection, it is one of the first points of importance to let the bunches have as much direct sunlight as possible, though for the black varieties we do not think this is so necessary. As to giving air after the fruit is ripe, for days together the late Grapes now hanging here have had no direct ventilation; only on really fine days is there any ventilation given, except what is almost continually on where the greater number of the plants are stood: except on warm nights the pipes are kept lukewarm. The latest of the fruit was ripe by the middle of October, and has kept as well as any, and better than a good many we have seen this season, as the almost constant cry of gardeners has been that they only wished to see the last of their Grapes cut. We have some Lady Downe's hanging in another house which were ripe in August; the house has been full of bedding plants since the end of September, and consequently the ventilation has not been stinted, yet the mouldy berries cut-out would not average two at the most to each bunch. The same applies to a Muscat at the Black Hamburgh end of the late house: these are not entirely cut yet, and with free ventilation we could wish for nothing better in the way of keeping.

We think it a great mistake for gardeners (in which term amateurs are included) not to be more guided by the many peculiar circumstances each one has particularly to do with, and try less to shape their modes of cultivating various subjects by hard and fast lines, which they may either have found to succeed well in one place, or have seen or read of some one else having succeeded with. The most successful gardeners will be found to differ essentially in their details of working from others, though there are sure to be leading principles the same in all cases. The subject we are more immediately in hand with is no exception to this; and we know of no better mode for obtaining good results in Grape-keeping than just to pick out the principles which may be enunciated by writers as a framework, and to fill-in the details in practice according to local circumstances.—R. B. P. (in *The Gardener*).

MESSRS. DOWNIE, LAIRD, & LAING'S ANNUAL BULB SHOW will commence in the Crystal Palace on the 21st March, and

will continue for a fortnight. Doubtless it will be well worthy of inspection.

### LADY HENNIKER APPLE.

THE facility with which new varieties of Apples are raised from seed is so great, that, as is usually the case in such instances, there is always a very large proportion of worthless sorts to a very few that are good. In the example before us we have one of the latter class, and one which will take its place among the very best of those Apples of which it is difficult to say whether they are culinary or dessert varieties. In this respect it takes rank with such kinds as Beauty of Kent, Wormsley Pippin, and Reinette du Canada. Attractive in size and in colour, it will make a show in a large dessert, and if

planted; these were reduced every few years. The last thinning was about seven years ago, when thirty-three trees were cut-out. The tree in question was always the favourite, and it has been carefully preserved. The cook says she prefers it to all others. It is largely used here when large and handsome dishes of mixed fruit are required for the dinner-table. Its appearance by lamplight is most telling. It is in use when the large shooting parties are on—viz., from October to February. The tree is very healthy and a great bearer."

### ROSE FÉLICITÉ PERPÉTUEE AS A STOCK.

I should like to make a suggestion to the numerous class of Rose amateurs. Has anyone given the old climbing Rose

Lady Henniker Apple.

need were, its flavour would not cause so much disappointment as many other fruits introduced to the dessert merely for the sake of their appearance.

The fruit is very large, roundish, narrowing a little towards the apex, and with blunt angles on the sides, which terminate in prominent ridges round the eye. Skin yellow on the shaded side, with a faint blush of red, which is covered with broken streaks of crimson on the side next the sun. Eye large and open, with short segments, and set in a very deep and angular basin. Stalk very short, set in a very deep, wide, russet cavity. Flesh very tender in the grain, well flavoured, and with a pleasant perfume.

A first-rate Apple, chiefly valuable as a cooking variety, but useful also in the dessert. Season from October to February.

This Apple was raised at Thornham Hall, near Eye in Suffolk, and the account of it furnished by Mr. John Perkins, the present gardener there, is the following:—

"Between the years 1840 and 1850 the late Lord Henniker had great quantities of cider made to give away in the summer months. Several bushels of Apple pips were sown in beds, from which the most promising seedlings were selected and

Félicité Perpétuee a good trial as a stock? From my observation of a few Hybrid Perpetuals that were some years ago budded on this stock, I think it would be well worth a trial. It is a very strong grower and very free rooter, and I think it is likely to be very suitable for Teas and Noisettes. I am aware that the stock has been previously tried, but I should like to know if anyone has tried Tea-scented kinds on it.

Is it anything uncommon for a seedling Rose to come into bud about ten weeks after its appearance above ground? I had one that did so this year, but I did not let it flower. —G. W. BOOTHBY.

### THE AMERICAN BLIGHT ON APPLE TREES.

By T. MACKAY, C.E.

[Read before the Nelson Association for the Promotion of Science and Industry.]

In the spring of the year a slight hoariness is observed upon the branches of many of our Apple trees. As the season advances this hoariness increases, and towards the end of the summer the under sides of some of the branches are

invested with a thick downy substance, so long as at times to be sensibly agitated by the air. Upon examining this substance it will be found that it conceals a multitude of small wingless creatures, which exude it from their bodies, while at the same time they are busily employed in preying upon the limbs of the tree. This they are well enabled to do by means of a long beak, or proboscis, terminating in a fine tubular bristle, which, being insinuated through the bark and the sappy part of the wood, enables the creature to extract, as with a syringe, the sweet vital liquor that circulates in the plant. The sapwood being thus wounded, rises up in excrescences all over the branch, and deforms it; the limb, deprived of its nutriment, grows sickly, the leaves turn yellow, and the tree perishes. The insect which is productive of so much mischief is a species of Coccidæ named *Aphis lanigera*, or woolly plant louse, popularly called the American blight. It was first observed in England in 1787, but it is uncertain if it was, as has been supposed, accidentally imported there from America. Some entomologists say it came from France. At all events, there is little doubt its original habitat was a warmer climate than that of Britain. It has, however, found its way hence from the latter country. The wonderfully rapid development of the aphid has thus been described by a popular writer:—

"It produces in the course of a season eleven broods of young. The first ten are viviparous, or brought forth alive, and consist entirely of females. These never attain their full development as perfect insects, but being only in the larval state (the larvæ are active, and resemble the perfect insect, but are wingless) bring forth young, and the virgin aphides thus produced are endowed with singular fecundity. But at the tenth brood this power ceases. The eleventh does not consist of active female larvæ alone, but of males and females. These acquire wings, rise into the air, sometimes migrate in countless myriads, and produce eggs, which, glued to twigs and leafstalks, retain their vitality through the winter. When the advance of spring again clothes the plants with verdure the eggs are hatched, and the larva, without having to wait for the acquisition of its mature and winged form, as in other insects, forthwith begins to produce a brood as hungry, as insatiable, and as fertile as itself. Supposing that one aphid produced a hundred at each brood, she would at the tenth brood be the progenitor of one quintillion (1,000,000,000,000,000) of descendants."—(Paterson, "Science Gossip," 1855.)

It will thus be seen what very formidable foes these insignificant-looking little pests are to our orchards, and two questions naturally arise—first, What is the cause of their being so? and second, Where can a thoroughly radical remedy be found against their ravages?

There are some particular kinds of Apple trees more attractive to these insects than others. Whether this may be attributed to the particular colour of the bark, a deficiency of lime, the presence or absence of certain juices in the sap, or to over-cultivation or climatic influences creating an abnormal condition of the tree, and consequently rendering it more susceptible to parasitical disease, it is hard to say; but the blight now treated of is evidently more destructive in semi-tropical climates, such as Australia and New Zealand, than in Britain, owing in a great measure to the effect which the frequent hot sunny days, succeeded by the cold frosty nights of early spring, have upon the circulation of the juices of the tree, unduly stimulating their flow in the daytime, and abruptly checking their current at night, by which they burst their vessels and become the food of such insects as have been already described, the insects being often mistaken for the cause of the disease, while they are really the effect of it.

That the action of the American blight, the scale blight, and the Cîcidæ on our Apple trees is, to a great extent, the effect of the last-described condition, there cannot be much doubt.

Assuming, therefore, such an hypothesis to be correct, it is clear that, in place of the various nostrums or specifics—such as the preparations of carbolic acid, corrosive sublimate, kerosine, lime, or sulphur, which are recommended for washing the diseased trees, or the plastering of the infested parts with moistened clay, all of which are very transient in their effects—a non-liable stock to disease should be selected on which to graft any liable variety the grower may desire to cultivate. That there are such stocks proof against blight there are several authorities for stating, and, moreover, there is a member of this Association, Mr. Lightband, sen., living in our midst, who has successfully treated the disease by grafting

an anti-blight tree, using a variety of winter Apple, on diseased ones.

In Darwin's book, "Animals and Plants under Domestication," vol. ii., chapter 21, "On Natural Selection," he says:—

"From some unknown cause the Winter Majetin Apple enjoys the great advantage of not being infested by the coccus."

"On the other hand, a particular case has been recorded in which aphides confined themselves to the Winter Nellis Pear, and touched no other kind in an extensive orchard. . . . Liability to the attacks of parasites is also connected with colour."

Considerable controversy has lately been carried on in the pages of the "Australasian" on remedies for the American blight, and much has been said in favour of using stocks of the Majetin Apple as a sure prevention of the disease. A Mr. Wade, of Pomona Place, Launceston, Tasmania, in a communication on the subject to the same paper, says:—

"That on his arrival in Tasmania he devoted special attention to the check and prevention of Apple blight, and one of his first ideas was to raise stocks from the seeds of those sorts not affected by blight. He chose the seeds of the Siberian Bittersweet, and the result was success far beyond his most sanguine expectations, for barely 1 per cent. of stocks raised from those seeds were in the least affected by blight, while some alongside, raised from promiscuous seeds, were destroyed by it, and that he has continued the system for several years with the same unvarying success."

Mr. Lightband's operations above referred to have been most successful. The juices of the fresh graft after a while permeated the whole of the diseased tree, infusing, as it were, a new life and fresh vigour into it. The aphides avoid infesting it, the leprosy bark exfoliates, and a clean sound bark takes its place; the tree continuing to bear two kinds of fruit—that of its original stock, as well as of the anti-blight graft. These, however, will no doubt in time merge their respective types or qualities, the one with the other.

From these circumstances it is not too much to say there are good grounds for assuming that, in the first place, as a prevention of the disease, the selection of an anti-blight stock on which to graft the particular kind of Apple desired to be grown will be the best means of insuring a healthy fruit-bearing tree; and in the second, as a cure for trees already affected with the blight, the inoculation process of Mr. Lightband is the most rational plan that can be adopted.

It is not the Apple tree alone, however, that such parasites persecute. The Pear, the Peach, the Apricot, and the Nectarine, as well as the smaller fruits, also the Grape Vine and the Hop plant, are all, more or less, infested by a species of one or other of them; and those who desire to derive both pleasure and profit from their fruit gardens or Hop grounds should not fail to seek for and apply proper remedies in good time.

In conclusion, it may not be out of place to advance a few words on the bearing which the theory of natural selection, or the survival of the fittest, has upon the subject now under consideration. It is obvious that without an operating cause—one, doubtless, amongst many, such as the parasitical influence of aphides on fruit trees in enforcing, as regards the latter, the necessary process of renewal by stimulating horticulturists to adopt improved methods of cultivation, as well as instinctively, as it were, to select such stocks as will prove the fittest against the destructiveness of these pests—with little exception many fruit-bearing trees would be left untended, and, as a natural consequence, would inevitably degenerate, and eventually dwindle away. In this will be recognised one, perhaps, of the many purposes designed for these tiny insects by that Providence Who hath numbered the very hairs of our heads, and without whose knowledge a sparrow doth not even fall to the ground.

The Vice-President having placed his microscope at the service of the meeting, the author was enabled to illustrate very clearly the peculiar nature of the American blight, as well as the scale blight. He also exhibited several branches of Apple trees from Mr. Lightband's garden, showing the curative effect of that gentleman's anti-blight grafting treatment.

A discussion ensued, in which several members took part.

Mr. Elliot mentioned that when on a visit at the Hon. W. Robinson's, in the Amuri, three years since, while walking through the orchard one morning he discovered a tree affected with the American blight, much to the disgust of the gardener. The trees in this orchard were at the time ten years

old. No fresh tree or graft had been imported into it for at least seven years, and the nearest fruit garden was twelve miles distant.—(Communicated by W. SWALE, Canterbury, N.Z.)

### HEATING—FUEL.—No. 2.

Gas having the greatest heating power of all ordinary combustible substances, it must necessarily be the best for heating hothouses or greenhouses by the circulation of heated water in iron pipes. I make no question of the superiority of gas over coke and coal, but whether it is equal in cost, or less or more expensive than either of these two, I am not in a position to ascertain, therefore I ask for information on this head.

In heating by gas all the heat generated by the combustion of the fuel can be utilised. The boiler or apparatus being entirely within the house, we not only secure the heat of the water in the pipes to be given off by them, as in other boilers heated by coal or coke, but the heat that is given off by the surface of the boiler itself, which in some cases, as when the boiler is in a shed outside the house, is equal to as much heating surface as would warm one or more of the compartments heated by the hot-water pipes. The great fault of the majority of our hot-water boilers is that their setting is heated quite as much as the water in the boiler, and the heat is all the time given off in space outside the structure, and is therefore sheer loss. No one would, neither do I, advocate the fixing of boilers so as to have the stovehole within a greenhouse, but I see no objection to having a properly-constructed boiler entirely within the house, yet stoked from the outside, so that the dust and smoke consequent on combustion may be kept from the plants. To have the boiler within the house is to derive the full benefit of the heat; to have the boiler outside is to lose the whole of the heat radiated from the boiler's outer surface, which in some cases is nearly, if not fully, equal to the surface acted-on by the fire.

Quite different is heating by gas to that by coal or coke. There is no dust or dirt, no frequent attention, the trouble is almost nothing, no cost of carriage of fuel beyond the first provision, no uncertainty of heating, the heat being the steadiest and most constant. On these grounds gas-heating is to be preferred to any other mode.

The boiler being within the house, and the air which is required for combustion derived from the house instead of from the external air—as in the case of boilers fixed outside—is this an evil or otherwise? The heating power being in proportion to the air consumed, and gas being the most powerful agent of all, it may be that we lose as much by taking from the internal warm air for combustion, admitting cold external air to supply its place, as is gained by having the heating power within the house. There may be some loss of heat in this way, for it is only just to consider that the displacing of warm air by cold must lower the temperature in which this takes place; but is not the displacing of warm vitiated air (as it all is in a confined structure) by the admission of cold fresh air, counterbalancing? This, if an evil, could be overcome by supplying the combustion chamber direct from the external air, moderating the current of air by a screen or screens of perforated zinc, and in this case no loss of heat would be experienced, the fumes of the gas being properly carried-off by a securely-jointed pipe or funnel to the external air.

It is generally considered that gas as a mode of heating is only suitable for small structures, but the reasoning by which such a conclusion is arrived at puzzles me. Because gas is at present only used for lighting and for heating on a small scale, what have we to be guided by in concluding it not suitable for heating on a large scale? Surely nothing but the supply, for if it answer—and there is no question about it—for small houses, it is evident it would do so equally well for large structures. The only thing would be to have larger apparatuses and separate ones for every structure, which is one of the greatest points in favour of gas as a fuel in comparison with either coal or coke. The heating by gas would enable us to dispense with reserve or duplicate boilers, without which it is admitted our very best makes of hot-water boilers are not safe. There is always an anxiety, especially in severe weather, attached to heating by one boiler which it is not pleasant to experience, to say nothing of a breakdown of the heating apparatus at such a time. By gas-heating we entirely relieve ourselves of the anxiety of a breakdown; we save the duplicate boiler, equal to the cost of furnishing every compartment with a separate heating apparatus; we are enabled to dispense with

a vast quantity of flow and return pipes to and from the boiler, which in many cases are equal to a large extent of heating surface, at times corresponding with the heated surface utilised; so that a considerable saving of fuel is effected by heating the radiating surface only, none being lost in supply and return pipes. When we add the value of the piping that is taken up in flows and returns, and the necessary elbows and costly valves, it is clear there is a saving in first cost of no mean amount, probably equal to half the first cost of an apparatus for heating each structure separately by gas.

Then when but little heat is required, the fire that has to be kept going for the heating on the one-boiler system of very little piping is something enormous compared with the work done, so much of it being expended in heating the water in the boiler (which is the same in quantity for a large as for a small extent of piping) and the connection pipes; so that we are left to wonder why in point of economy we departed from the principle of heating each house separately and adopted the one-boiler system. We cannot get more from the fuel than the heat there is in it; and how a large furnace should give more heat than four or half a dozen smaller ones, the quantity of fuel being the same, is only to be accounted for by the extravagant manner in which we employ the fuel, half its heat being expended on the setting; consequently we have almost as much loss by the setting of a smaller boiler as in that of one six times larger: hence the greater heating power of a large as compared to a small boiler furnace.

Every house should have its separate heating apparatus, which should have a boiler so constructed that the whole of the heat, less that below the temperature of boiling water (212°), afforded by the fuel, will to the utmost extent be given out and imparted to the water; and this being the case, as I see no reason why it should not, the necessity or value of the one-boiler system and accompanying duplication vanishes. Gas, because it enables us to heat every structure independently of another, because there is no waste of heat or fuel, and because of its certainty and steadiness of action, cleanliness, and easy management, I hold to be the best mode of heating, and therefore preferable to all others.—G. ABBEY.

### INFLUENCE OF THE STOCK ON THE SCION, AND VICE-VERSA.

[Essay Read at a Meeting of the American Pomological Society.]

Born theory and practice teach us that the relationship existing between the root and the top of a tree cannot be impaired to any great extent by any artificial intervention of man. The very moment that an inserted bud or graft commences to granulate and then unite, that moment the two parts of the embryo tree struggle, as it were, for the mastery. That is, certain idiosyncrasies, inherent either in the branches of the one or the roots of the other, will form a leading feature in the mature plant. Abundant proof of this is afforded by examining the roots of nursery-grown Apple trees, whether budded or grafted. Take, for instance, some well-known variety, as the Bellefleur, and the roots will be found uniformly long, slender, and very fibrous; other kinds will prove exactly the opposite. If we place a graft of some well-marked variety upon any ordinary stock, say 5 or 6 feet high, in a few years certain peculiarities of the bark will be found extending down from the branches to the body of the tree; as is instanced in the Newtown Pippin Apple, and Van Mons Léon le Clerc Pear. Another curious feature respecting the influence of the scion upon the stock, is noticeable in some of the so-called "sports," or variegated-leaved plants.

During the past season [1872], a Mountain Ash, upon which was budded a variety with variegated leaves, commenced to push forth young shoots from the main body of the tree, below the point where the bud was inserted. In every case these had variegated leaves. Now, in view of the fact that these adventitious buds were there in advance of the original variegated bud, the presumption is that they were created green, and their normal condition yielding to the controlling influence of the new branches, caused the change to occur by the flow of sap from above.

A still more remarkable case than the one above cited, was related some time since. Scions of a diseased Horse Chestnut with yellow leaves were worked upon strong, healthy young trees. Sometime thereafter, upon examining the stocks where the scions had failed, young shoots were found down the body bearing the identical yellow-hued foliage; and yet, where the

buds originally inserted had "taken," they produced perfectly healthy green leaves.

This disease, for I hold that all variegation is in some manner unhealthy, had evidently been communicated from the bud or scion to the stock before the death of the former, and for a short time during its vain struggle for existence, contaminated the parts below.

The Scientific Committee of the Royal Horticultural Society also records a like case with a yellow-leaved *Laburnum*. After the inserted bud had died, variegated shoots were noticed issuing from the stock both below and above the inserted point; and Dr. Masters, the English botanist, has stated that an *Abutilon* had thrown out variegated shoots after grafting with a variegated variety, but ceased to do so after the inserted graft died.

But, in some instances, the stock exerts a marked influence upon the scion, thus showing the co-operative system in use between them. The *Gardeners' Chronicle* mentions an instance of a couple of Muscat Vines worked on the Black Hamburgh, in the same house with a Muscat, on its own roots. Those worked on the Hamburgh start fully five or six days in advance of the one on its own roots, although they are nearly a fortnight behind the Hamburghs they are worked on. It is a curious fact that there has never been seen any difference in the ripening season, nor any effect on the fruit.

As we stated in the commencement, certain marked peculiarities will, sooner or later, always make themselves known; sometimes it will be one thing, and again another and totally different feature assumes the superiority. The governing cause, involved in mystery as it is, to a certain extent affords us a clue by means of which we may study a very useful lesson in plant life.

We know that all vegetable growth arises from a cell, and what are termed young shoots, leaves, blossoms, &c., are in fact but an accumulation of cells, which, in time, develop woody fibre and other organs. The propagator of new varieties knows that a single bud, or a section of a young branch, may be inserted in a different tree, and these will unite and produce fruits and flowers similar to the kind from which the bud or graft was taken. Now, let us inquire into the changes that occur during this growing process, or, as horticulturists term it, "taking." Between the wood and bark is where active growth takes place, and the layer of young cells found here is known as the cambium layer. All growth, of whatever nature, is by cells, the origin of which is, however, at present unknown. But this cell-growth is accomplished by small protuberances making their appearance on the walls of the older cells, and these rapidly increase, and again, in turn, assist in the formation of others, and this is carried on so long as growth takes place. Without going into a long dissertation upon the subject of cell-growth, which would form a long essay in itself, I will merely state that the question has been asked in relation to a budded tree, Can the cells, at the point of union, be partly of one variety and a part belong to another? My theory is, that a cell singly is entirely a component part of the variety from which it originates, either from the scion or stock, and is invested with all the powers and principles inherent in that part. A single cell cannot be of two varieties, but a collection of cells, as, for instance, the cellular tissue, may be formed partly of both. The vascular or fibrous tissue is governed by the same laws, each separate, but the little bundles of woody tissue uniting by their outside covering or walls, thus forms a compact mass of wood, and the bud or graft has taken, which ultimately forms the future tree.

A bud is, in fact, an embryo tree. It contains within its protective covering all the elements of tree growth, with all the organs of vegetation and reproduction intact. Therefore, when a bud is inserted beneath the bark of another plant, the cellular growth at once takes place on both sides, these unite by their outside walls, and the so-called sap commences to circulate in the intercellular passages from one to the other. It is, therefore, no wonder that certain peculiarities embraced in the root may be found developing in the scion or top, and *vice versa*. That the scion is enabled to reproduce its kind, is due to the fact that its young growth is merely an increase of cells already formed, and the variations alluded to at the commencement of this paper are the result of constant currents of sap flowing between the two remote portions of the tree, and at the same time imbuing the one with certain marked characters contained previously in the other. Thus, in a somewhat hurried, and I fear very imperfect manner, I have alluded to the influence of the stock upon the scion, and *vice versa*.

This interesting subject is by no means all theory, as many suppose, but is the result for the most part of close examination by means of a powerful lens. Future investigation will, undoubtedly, reveal many novel features which we now know not of, and to accomplish this fully the patient student of horticulture is asked to join the botanist in the pleasant task.

But there is another and more popular aspect to this subject, the relative advantages of certain stocks for particular species of plants. Under this heading we may take, for example, the Plum worked on the Peach. Prejudice and distrust on the part of many cultivators have done this operation great injustice. To the owner of a heavy soil, where the Plum root thrives luxuriantly, Peaches should be planted with caution; but, on the other hand, in the great Peach districts, with a light mellow soil, the Peach root will succeed far better than the Plum. Peaches always make a large number of strong fibrous roots, and return to the top a vast amount of nutrition. The junction in certain varieties of Plum on Peach roots is perfect, and the tree is long-lived and healthy.

The testimony of some of our most noted pomologists goes to show that the practice is correct, and a careful examination plainly indicates that the theory is faultless as well.

The subject of dwarfing fruit trees is not properly understood. The Pear worked on Quince roots certainly dwarfs the tree to a certain extent, and for a few years; but is the process caused by some inherent property contained in the Quince? We think not. Once allow the Pear to throw out a few roots above the point of junction, and the tree becomes a standard. The abundance of sap or nourishment gathered up by the roots and forwarded to the top causes in most cases a larger and finer growth of fruit, thus showing that the Quince is adapted to these kinds; but take an uncongenial variety, and mark the result. The fruit is often in such cases worthless. Years ago we were told that budding Cherries on the Mahaleb stock would cause the trees to become dwarf. Little did these propagators know that when they annually pruned their trees, this was what dwarfed them, and not the root. The junction in this case is always perfect, and it is a well-known scientific fact that excessive pruning causes debility in a plant, and that when vitality is checked the tree becomes dwarf as a matter of course. Excessive growth and productiveness seem to be generally antagonistic. A dwarf tree, after the first vigorous growth is over, will, if healthy, produce good crops and mature a reasonable amount of new wood. Certain varieties of Pears, as, for instance, the Bartlett, never unite properly on the Quince stock—the cellular tissue of each never seems to make a perfect union. Very many trees that we have examined under a strong lens reveal a marked line between the cell-growth of the two, and not, as in the case with other kinds, a lengthening of both cell-growths, one up and the other down, so that it is very difficult to determine where the exact point of insertion really is. There are causes, over which we have no control, that debar us from dwarfing some varieties, but science has not yet solved the mystery.—JOSIAH HOOPES.—(*Horticulturist*.)

## HOLLAND HOUSE,

THE RESIDENCE OF BARONESS HOLLAND.

Not one other among "the stately homes of England" have had either for its possessors or its tenants such a series of totally distinct characters, mostly celebrities, but differing in their opinions as widely as in their positions. A volume could be filled with anecdotes and stirring details, rendering the continuous narrative interesting, which told how the house passed from tenant to tenant ever since Geoffroy de Monthray, Bishop of Coutances, and Aubrey de Vere, Earl of Oxford, held the manor in the time of William the Conqueror. A mere enumeration must suffice in our columns. Sir Walter Cope, James I.'s money-lender, bought the estate of the last of the De Veres, and built, in 1607, the present mansion. His daughter brought the estate to the Earls of Warwick. During the Parliamentary War General Fairfax was its tenant, and tradition tells that he and Cromwell and Ireton held conferences beneath its trees. Addison was husband of its proprietress in 1716. It had various other tenants, and of these were William Penn, the Quaker, politician, and colonist; Mrs. Morrice, daughter of the exiled Bishop Atterbury; and Shippen, the incorruptible Jacobite. In 1762 it was sold to Mr. Henry Fox, ancestor of the first Lord Holland, and it has continued in possession of this family.

The grounds of Holland House have been several times

noticed in our pages by Mr. Keane, and it is not surprising that such a fine old place, so near London too, should receive so much attention; but now that the Princess of Liechtenstein's splendidly illustrated work\* has brought it so prominently before the public, it may be useful to reproduce some of Mr. Keane's notes on the gardens, to appreciate the beauties of which, however, the summer, not the winter, is the proper season. The flower beds, of course, are now no longer bright with many hues and beautiful combinations of flowering and fine-foliaged plants; but even in their present more sombre state, from their neatness, and being set in smooth green sward or well-kept Box edgings—some fifty years old—they are pleasing to the eye, and afford a good idea of how effective such beds skilfully planted must be when at their best. Conifers, save some fine old Cedars, are but few, for the London smoke is destructive to them as to many other plants,

though Holland Park is not more exposed to it than other places at a greater distance from the densely-peopled portions of London. Still it is well known to travellers by the Great Western road that if there is a fog, it is always at its thickest at Holland Park, and gardeners in the country know little of how smoke-begrimed is a plant after such fogs as we had in the end of last year. Besides, Holland Park is slowly but surely becoming engirdled with houses, and as time goes on the bonds will grow tighter still. The old Elms, in which the rocks love to congregate, and other deciduous trees, are now gaunt and leafless, but in summer form noble masses of verdure.

We will now quote from Mr. Keane, but it must be borne in mind that he wrote in summer.

The grounds of Holland House are entered from the high road between Kensington and Hammersmith, and the approach

HOLLAND HOUSE—WEST FRONT.

is through an avenue of Elm trees. Before the south front is a large square bowling-green terrace, bounded by balustrades adorned with flowers in vases and Orange trees, and in the centre with a large basin fountain. Before the east front is the carriage square.

Before the north front is a terrace walk 200 yards long by 5 feet wide, with a colossal statue of Charles James Fox, which overlooks it from the highest point. Parallel with the east side of these grounds runs a long broad walk under a grove of fine old Elm trees, called Louis Philippe's walk, from the circumstance of the King of the French having visited Holland House and grounds at the time it was made. The ground rises on all sides to a beautiful knoll in the park, crowned with an old and picturesque Cedar of Lebanon. Fine old Cedar and other trees creep on the slopes, and form groves around the base and along the valley—not thick groves of gloom, but groves in which the forms of the trees are fully developed, and, being planted at various distances apart, producing glades of pleasing landscape scenery.

Before the west front of the house (of which the accompanying is a representation) is a flower garden, a rich parterre and beautiful pattern, the walks brimful of gravel, and the beds overflowing with all the most choice and best sorts of flowers.

It is arranged in the best manner to give the pleasing variety the contrast, and the distinctness of colours which are clearly and expressly defined throughout the composition, and is seen to advantage when the whole is overlooked from the terrace, surrounded by balustrades, on the top of the banqueting room. It is protected on the north side by a wall, and on the west by the ruins of what had originally been a stable, which is now made, by the stables having been arched with masonry and covered with Ivy, to resemble a ruined aqueduct.

Of the portion called the Dutch garden we are enabled, through the courtesy of Messrs. Macmillan, to give a view taken from the south-west side, outside the Ivy-covered arches referred to. The bust seen in the engraving is that of Napoleon I., opposite to which is an octagon marble basin, and next the wall the embowered seat of Rogers the poet, with these lines over it—

“Here Rogers sat, and here for ever dwell  
With me those pleasures that he sings so well.”

The whole of this section of the garden is enclosed by a dwarf Box hedge. Outside of the arches is a small terrace garden in Box, and beyond it, on a lawn, several Apple trees, on which the Mistletoe is flourishing.

The Lily Pond garden is simple in design, with an oval pond surrounded by four L-shaped corner beds, and the pond in

\* *Holland House*. By Princess Marie Liechtenstein. Macmillan & Co.

summer is covered with the beautiful *Nymphaea alba*. There is a corresponding panel, in which the centre is an oval bell, which in summer is filled with Cannas and other sub-tropical plants.

The conservatory is 60 feet long, furnished with some specimens of *Camelias* planted in the border, and with the large Orange trees that adorn the square before the south front of the house. Attached to the conservatory on the north side is a banqueting room of handsome proportions, and furnished in the best style of art and ornamentation. Close to it, on the east side, is a tower, which is approached by a flight of steps; and from the south side of the conservatory is a colonnade 66 yards long, running east, which is continued to the front of Holland House. By this means a communication under cover is opened from the house to the conservatory, then to the banqueting room, then to the loggia, then to the tower, and home by the flower garden, by the pleasure ground, or by the terrace walk, along the whole length on the top of the colonnade.

Passing from the square where Orange trees and other greenhouse plants stand during the summer months, we enter the orchard house, thirty yards long. It contains Peach and Nectarine trees planted against the back wall and in pots, besides Plum and Cherry trees in pots. Having crossed the green drive embosomed in a grove, we enter a range of glass 45 yards long heated by hot water, and divided into five parts, consisting of vineries early, succession, and late, and Peach houses. Besides these there are two ranges of heated pits, and frames filled with an abundance of bedding plants for the summer.

Holland House is surrounded by pleasure grounds so nicely connected with the park that a beautiful and varied landscape is produced, bounded by deep shady groves that form the framework of this delightful picture. In these well-wooded grounds are many fine old trees. An Elm measured 17 feet 3 inches in girth (a re-measurement this year gave 15 feet), and two Cedars of Lebanon 14 feet 9 inches, and 12 feet 6 inches each at 2 feet from the ground.

Before concluding these remarks we must notice a green drive, which extends half a mile in length towards the Baywater Road, forming, in fact, a grove of Elm, Lime, and other trees, and the Lime-tree walks in proximity to the house must be delightfully shady in the summer heats. We have to add that the keeping of the gardens reflects great credit on Mr. Dixon, who has their management, and that the visitor meets with every attention at his hands. Further particulars respecting this place and the summer bedding-out in former

years will be found in our new series, vol. ix., p. 256, and vol. xxiii., p. 159.

## NOTES ON VILLA AND SUBURBAN GARDENING.

**MANAGEMENT OF PLANTS IN ROOMS.**—When, as often, plants are slightly injured by frost, cold water should be sprinkled on them before the sun reaches them, and this sprinkling ought to be continued as long as any appearance of frost remains on the foliage. Water is often very judiciously applied to plants in rooms, and the evil arises from falling into the opposite extremes of too much and too little. Fear of spoiling the carpet, forgetfulness, and sometimes a dread of injuring the plant, are the chief causes of an under-supply of water. On the other hand, many have a notion that such plants should have water every day and at stated periods, without inquiring whether it be necessary or not. Saucers or pans are often placed under flower pots to prevent the water which escapes from soiling the apartment, but in these cases the saucers should be partly filled with gravel to prevent the roots from being soaked with water, or the water which lodges in the saucer should be removed. Fancyful and elegant baskets of wire or wickerwork, and plant-tables, are perhaps preferable to common stands. The baskets should have a pan of zinc, copper, or other metal, and over this a bottom pierced with holes, or a grating of wire, on which the pots are to be placed. The pan is generally about an inch deep, and has a plug or other contrivance by which the surplus water may be drawn off. Plant-tables can be constructed in the same manner, and admit of an endless variety according

THE GARDEN AT HOLLAND HOUSE.

to the taste of the owner. In either of these the pots may be wholly concealed by green moss or cut paper, so that nothing but the plants themselves may appear. Water is as essential to the leaves as it is to the roots, because they are liable to get dirty, and thereby to be injured. They should therefore be frequently washed over with a syringe having a rose to it; and in order to perform this operation properly the plants must generally be removed to some other apartment, where they should remain till they are dry. In winter this operation must be performed in mild weather, only if it shall be done in an apartment not colder than that in which the plants usually stand, and the water should be about milkwarm. When the plants are in baskets or on tables they can be removed and washed without deranging their order. Plants which have large and leathery leaves, such as Oranges, Pittosporums, *Camelias*, and *Myrtles* may be washed with a sponge, or if very foul with soap, and the soap carefully removed by pure water. Loose dust may be removed by a pair of bellows. Attention to cleanliness greatly increases the vigour of the plants.

Bulbs of most sorts flourish in rooms with less care than many other kinds of plants. Hyacinths should be planted in October.

In preparing pots for them select such as are about 4 inches deep and 3 inches wide, put a bit of rotten dung in each pot, fill each pot up with light rich soil, and plant the bulbs so shallow that nearly half the bulb stands above the soil; plunge the pots in the open air, and cover them 6 or 8 inches deep with rotten bark. During spring take them out as they are wanted to come into flower, and set them in the window of a warm room where they will be fully exposed to the sun. Those who do not possess a garden may set the pots in a cellar or outhouse, or in the corner of a yard, and cover them with light soil or sand until they are wanted to bring into the rooms to flower. When the leaves begin to decay after they have done flowering, give them no water. When the leaves are dead take them out of the soil and remove the offsets, and lay them in an airy situation until the time of planting. If grown in water-glasses they require to be placed in a light airy situation, and the water will require to be changed once in three or four days. If drawn-up weakly it will be necessary to support the stems with sticks, split at the bottom so as to fit the edge of the glass at the top. This, however, will not be necessary if they are kept in a light and airy situation. When out of flower plant them in pots of soil to perfect their leaves, and treat them as above; they will flower again the succeeding year. This is the favourite mode of house culture, and the bulbs best adapted for it are Hyacinths, Polyanthus, Narcissus, Van Thol and other Tulips, Crocus, Persian Iris, Narcissus, Colchicums, Guernsey Lily, Jonquil, and others. Dark-coloured glasses are the best, as they prevent the light from interfering with the roots of the plants. Rain water is preferable to any other, and it should be changed frequently to prevent its getting putrid, and in performing this operation care must be taken both in withdrawing and in replacing the roots. This is necessary till the flowers have expanded, for after this the plants may be left undisturbed till the flowers have decayed. The water which is supplied must not be colder than that which is withdrawn or than the general temperature of the apartment. Much heat is not necessary for such plants, because they flower better the more slowly their vegetation proceeds. Chimney-pieces and other warm situations are not nearly so well adapted for these bulbs as stages near the window, or the window-sill itself.

At this season, when there is little to be done in the way of cropping, everything around the villa should be made clean and neat. All vegetable refuse may be collected into a heap to rot for manure: nothing of this kind should be lost. Vacant ground, if any, may be turned-up rough to be fully exposed to the action of the weather. This is especially necessary for strong soils, in order that the frost may separate their parts and render them more friable. When manure is applied, a little at a time as often as an opportunity or the nature of the crops will allow, is better than when the ground is overloaded with dung.

**VEGETABLES.**—If a sowing of Peas and Beans has not yet been made, no time should be lost in getting them in while the weather continues favourable.

**FRUIT.**—Continue to prune any fruit tree if not done last week, taking care, however, to keep the spurs short and close, otherwise they soon become long and give the trees an unsightly appearance.

**FLOWERS.**—Remove everything unsightly from the flower plot. Nothing looks worse than to see decayed stems of plants standing at this season. Bulbs, if any, that have made their appearance above ground should be protected in the event of frosty weather; but not unless, as this has a tendency to make them weak and tender.

It has been proved by severe winters that evergreens are extremely hardy and will bear any severity of frost. All those evergreens considered most tender, such as Portugal Laurels, Rhododendrons, &c., were observed to brave the frost unhurt, when they were placed in high unsheltered places, or facing the east or north. It was observed also, that those evergreens were destroyed whose aspect was south and west, and which lay in warm and sheltered situations. The cause is this: The shrubs did not suffer which were not subject to alternations of heat and cold, while those which lay in warm situations, being thawed by the sun's rays during the day, could not endure the sudden chill of returning frost at night.—W. KEANE.

## WERE THE FRUITS MADE FOR MAN, OR DID MAN MAKE THE FRUITS?

(Essay by Professor Asa Gray, read before the American Pomological Society.)

THESE need not be taken as mutually exclusive propositions; for as "God helps those who help themselves," and man's work in this respect is mainly, if not wholly, in directing the course or tendency of nature, so there is a just sense in which we may say "The art itself is nature," by which the greatest triumphs of horticultural skill have been accomplished. Moreover, I am not one of those naturalists who would have you

believe that nothing which comes by degrees, and in the course of nature, is to be attributed to Divine power.

The answer I should give to the question, as we thus put it, is—

1. Some fruits were given to man as they are, and he has only gathered and consumed them. But these are all minor fruits, and such as have only lately come within the reach of civilised man, or are not thought worth his trouble. Huckleberries and Cranberries, Persimmons and Papaws are examples taken from this country. Whether even such fruits have or not been under a course of improvement irrespective of man, is another question.

2. Others have come to man full-flavoured and nearly all that he has done has been to increase their size and abundance, or extend their season. Currants and Gooseberries, Raspberries and Blackberries, Chestnuts, and, above all, Strawberries, are of this class.

3. But most of the esteemed and important fruits, as well as the grains, have not so much been given to man as made by him. The gift outright was mainly plastic raw material, time, and opportunity. As to the cereal grains, it is only of the Oat that we probably know the wild original; of Wheat there has been an ingenious conjecture, partly but insufficiently confirmed by experiment; of the rest, no wild stock is known which is not, most likely, itself an escape from cultivation. Of some of them, such especially as Maize, not only can no wild original be indicated, but in all probability none exists.

So of the staple fruits. Of some the wild originals can be pretty well made out, of more they are merely conjectural; of some they are quite unknown, and perhaps long ago extinct.

To cite examples in confirmation or illustration of these points, to note how very ancient some of our varieties of common fruits are, and how very recent certain others—to consider how they have originated, with or without man's conscious agency, and how they have been perfected, diversified, and preserved, mainly under man's direct care—would be to expand this note into an essay, and yet to say nothing with which pomologists are not familiar.

It would be curious to speculate as to what our pomology would have been if the civilisation from which it, and we ourselves, have sprung had had its birthplace along the southern shores of our great lakes, the northern of the Gulf of Mexico, and the intervening Mississippi, instead of the Levant, Mesopotamia, and the Nile, and our old world had been opened to us a new world less than four hundred years ago.

Seemingly, we should not have as great a variety of choice fruits as we have now, and they would mostly have been different, but probably neither scanty nor poor. In Grapes, at least, we would have been gainers. Our five or six available species, of which we are now just beginning to know the capabilities, would have given us at least as many choice sorts and as wide a diversity as we now have of Pears; while Pears would be a recent acquisition, somewhat as our American Grapes now are. Our Apples would have been developed from *Pyrus coronaria*; might have equalled anything we actually possess from *Pyrus Malus* in flavour, though perhaps not in variety, if it be true, as Karl Koch supposes, that the Apples of the orchards are from three or four species. Our Plums would have been the progeny of the *Chicaea*, the Beach Plum, and our wild red and yellow *Prunus americana*, which have already shown great capacity for improvement; our Cherries might have been as well flavoured, but probably not as large as they now are. But instead of Peaches and Figs, we should be discussing manifold and most luscious varieties of Persimmon and Papaw, the former, probably, equal to the Kaki just acquired from the far east. As to Strawberries, Gooseberries, and Currants, we should have lost nothing and gained something, as we possess several species, besides the European types themselves; as to Blackberries and Raspberries, we should have been better off than now, by the earlier development and diversification of our indigenous species. And we might have had all our finest Strawberries a thousand or more years ago, these having come from our American types *Fragaria virginiana* with its varieties (which, as well as the old-world *F. vesca*, occurs all across the continent), and *F. chilensis* which ascends the Pacific coast to Oregon.

Then we should consider how much earlier our race, with an American birthplace, would have been in possession of Tomatoes, of the Pine Apple, of the Cherimoyer, and the other Custard Apples, of the Star Apples, and other sapotaceous fruits, of Chocolate, of Lima Beans in all their varieties, of Peanuts; not to speak of Potatoes, Sweet Potatoes, and

"Jerusalem" (that is, Gira-sela or Sunflower) Artichokes; the last supplemented by our Ground-nut (*Apios tuberosa*) would have been the first-developed esculent tubers, and would probably have held their place in the first rank along with Potatoes and Sweet Potatoes of later acquisition.

Among the causes and circumstances which have given to the fruits of temperate climates of the old world their pre-eminence, opportunity is one. How many potential fruits of value lie undeveloped in this country we know not, and more, shall never know. They have lost their opportunity. Necessity, which is the mother of pomology as well as of other invention, has been fully supplied out of other accessible, and in some cases, no doubt, originally better materials.

There are some, however, for which evidently "a good time is coming." Of these, our wild Grapes are foremost. They have such a start already, and seedlings, whether from crosses or otherwise, can be produced and selected and reproduced in so short a space of time, that they will probably have achieved their position when the American Pomological Society holds its centennial celebration.

Blackberries, from *Rubus villosus*, are in similar case; and if due attention be paid to the Low Blackberry or Dewberry, and to the Sand Blackberry of New Jersey and farther south, the foundation for a greater diversity of excellent sorts will be laid.

As to Cranberries, already an important staple, increase of size and abundance of production are all that are to be expected. It is easier to bring about improvements in the direction of sweetness than in that of acidity. Huckleberries, also, have probably nearly reached their perfection unassisted.

A few wild fruits may be mentioned which manifestly have great capabilities, that may or may not be developed in the future. The leading instances in my mind are the Persimmon and the Papaw—not the true Papaw, of course, which we have in Florida, but the *Asimina* or Western Papaw, so-called. Both Persimmons and Papaws are freely offering from spontaneous seedlings incipient choicer varieties to be selected from; both fruit when only a few years old, thereby accelerating the fixation of selected varieties into races; and both give fruits of types wholly distinct from any others we possess of temperate climates. He that has not tasted a *Naki* has no conception of the capabilities of the *Diospyros* genus. The Custard Apples of the West Indies give some idea of what might be made of our Papaw when ameliorated by cultivation and close selection from several generations. I have understood that one of the veteran pomologists of the country, Dr. Kirtland, of Ohio, a good while ago initiated a course of experiments upon the Papaw, in this regard; it would be well to know with what success, and whether the breeding and selection have been continued through successive generations.

Our American Plums, already mentioned, have for many years been in some sort of cultivation, and have improved upon the wild forms; but I suppose they have not been systematically attended to. Their exterior liability to black-knot and other attacks renders them for the present unsuccessful.

Finally, if pomology includes nuts, there is a promising field uncultivated. Our wild Chestnuts are sweeter than those of the old world; it would be well to try whether races might not be developed with the nuts as large as Marrons or Spanish Chestnuts, and without diminution of flavour. If we were not too easily satisfied with a mere choice among spontaneous Hickory-nuts, we might have much better and thinner-shelled ones. Varying as they do excessively in the thickness of the shell and in the size and flavour of the kernel, they are inviting your attention, and promising to reward your care. The Pecan is waiting to have the bitter matter between the shell and the kernel bred out; the Butter-nuts and Black Walnuts to have their excess of oil turned into farinaceous and sugary matter, and their shells thinned and smoothed by continued good breeding; when they will much surpass the European Walnut.

All this requires time, almost unlimited time; but it is not for those who are enjoying the fruits which it has taken thousands of years to perfect, to refrain from the good work which is to increase the enjoyments of far future generations.—(*Horticulturist*.)

## DOINGS OF THE LAST AND PRESENT WEEK.

### KITCHEN GARDEN.

PRUNING *Gooseberry* and *Currant bushes*, also looking over fruit trees to thin-out branches where crowded. Digging and trenching kitchen-garden quarters. Where the division lines

consist of any description of fruit trees, the pruning should always be done before the ground is dug or trenched; it is also desirable to loosen the surface soil under the bushes or trees to the depth of 3 inches, and to throw it out into the middle of the quarter, and this for a twofold reason: First, the larvae of insects are to be found in the surface soil, and if they are buried at the bottom of the trenches will be destroyed; and in the second place, the new soil which is taken from the open ground to replace that which has been removed will act as a stimulant to the trees. When *Gooseberry* bushes are infested with caterpillars, removing the old soil in this way any time during the winter and replacing it with fresh is an effectual remedy. The old soil ought always to be placed on the surface of ground which has to be trenched, as in digging much of the top soil is still left near the surface. In all operations of digging and trenching it is well to study neatness. The ground, if at all uneven, should be levelled, and the surrounding alleys which may contain weeds have the surface scraped off with a spade; and before digging out the trench a line should be tightly stretched along the side and the ground marked off; and on finishing the work a line should be again used and a neat edging made.

In gardens where there are plenty of frames, hand-lights, and other glass appliances, it is easy to obtain early crops of the smaller vegetables and salads, but where the glass is restricted, Early Horn Carrots, Radishes, and Paris White Cos Lettuce may be sown on sheltered borders facing south; the soil being dry and the weather fine, it may be done at once. For all small seeds that are sown early it is very desirable to place about 2 inches of fine dry soil over the surface and to sow the seeds in it. Where there is much potting done there will always be a supply of fine soil from the potting-shed. This ought not to be wheeled-out and wasted, as is sometimes done, but stored in a dry place, so that it may be always at hand to be used as indicated above. The early-sown Peas must be watched, as the long-tailed field mice are very partial to them, and will do much damage if not trapped by the usual methods.

### FRUIT AND FORCING HOUSES.

Our *Vines* in the early houses are slow in breaking this year. The borders have been well supplied with tepid water, that on the outside being protected with wooden shutters as well as fermenting material underneath the shutters. The heat, whether the covering is composed of stable manure or a mixture of that and leaves, declines in four or five weeks, when it may be removed by turning the heap over and mixing some fresh material with it. Advantage should be taken of this to water the border, the water to be of a temperature of 55° or 90°. Cold water may be taken from a river or pond if rain water is not to be had, and raised to the required temperature by adding hot water from a copper as the watering proceeds. Water should not be allowed to stand in the copper and be used afterwards; such water is occasionally injurious to the roots of plants.

We have not yet cut the Grapes in the late vineries, but for the last three or four years all the bunches were cut between Christmas and New Year's-day, the stalks inserted in bottles of water, which were hung-up in an airy fruit-room. Lady Downe's, Gros Guillaume, and Muscat of Alexandria will be all the sorts that remain for this purpose. This year Royal Vineyard and Mrs. Pince's Black Muscat are quite spoiled with mould. The season which has just passed has been a bad one for keeping Grapes; and fuel being so dear, the heating apparatus was not used when it ought to have been—at the time the Grapes were colouring, so that the fruit is not well ripened. The more sugar the fruit contains the firmer will be the flesh, and the better will the fruit keep.

Successive batches of Strawberry plants in pots are making healthy progress; the earliest (Black Prince) are setting their fruit in a dryish atmosphere and a night temperature of from 60° to 65°. The pots are on a shelf very near the hot water pipes, and at this stage of their growth none of the plants must be allowed to suffer from want of water. Many growers recommend saucers of water under the pots. We tried this once, and will not do so again, the result not being satisfactory. About four years ago, finding the hot-water pipes under the pots acted upon them injuriously, and those pots at the hottest end suffered most, boards were laid over the pipes to prevent the heat from ascending directly to the pots; this was a great improvement to the health of the plants.

Clumps of Mint and Tarragon should be potted-up and placed in any of the forcing houses. The early Potatoes, spread out thinly in a dry loft, have sprouted nearly an inch. Those who force their first crop in frames or pits should have their plants set out; if not yet done, no time should be lost. We prefer heated pits to frames for them; but if pits are not available, a bed of leaves and manure should be raised, with 6 inches of loam on the top, and the sets must not be put in until the bottom heat declines to 55° or 90°. When pits are used for this crop with artificial heat from hot-water pipes, the plants should be near the glass, and air should be freely admitted when the plants are above ground; they are also liable to the attacks of the aphid tribe, which should be destroyed by fumigation.

## PLANT STOVE AND CONSERVATORY.

The plan we pursue with the plants in our stove at this season may commend itself to others who grow mixed collections of plants in the same house. There are many species of plants which thrive best in a moderately moist atmosphere with a minimum temperature of 65°—such subjects as *Nepenthes*; some of the Palms, as the noble *Phœnicophorium sechellarum*; and *Orchids*, as *Phalenopsis*. All hardwooded plants that are expected to flower freely during the ensuing spring and summer months should not be wintered in this house. Many species of *Orchids* require a lower temperature and drier atmosphere to insure freedom of flower and robust health, such as *Vanda tricolor*, *V. suavis*, *V. insignis*, *Aërides odoratum*, *affine*, *Fieldii*, and many other species, East Indian *Dendrobies*, &c. Our plants are removed to the Pine house, where the Pines are at rest.

A succession of flowers can be obtained by removing *Gardenias*, *Clerodendrons*, *Allamandas*, &c., from such a house as this to the stove, at intervals of two weeks. We do not approve of potting any plants during the winter months, but it is sometimes necessary. Some choice new Ferns were growing freely, and the pots had become matted with roots, these were potted, and *Dendrobium chrysotis* commencing to grow was also fresh-basketed. Plants of this *Orchid*, though not imported much more than twelve months, have made growths nearly a yard in length. Thrips persist in attacking the *Orchids*. *Cypripedium Veitchii* is their favourite feeding ground. Many splendid specimens have been disfigured by this pest. We fumigate periodically during the winter months, first removing tender Ferns and *Orchids* from the house. Every plant known to be infested with bug or scale has been overhauled and thoroughly cleansed with a sponge and tepid water in which soft soap has been dissolved. We are rather short of flowers in the conservatory. Roman Hyacinths are nearly over, but Tulips, Hyacinths, and other Dutch bulbs are coming in.

A few plants of *Azalea indica* have been placed in the forcing house, also *Deutzia gracilis*, *Spiræas*, *Lily of the Valley*, &c. A batch of *Roses* in pots, which were recently pruned, were placed in an early vinery at rest. The house has been started; the *Roses* and a batch of dessert Orange trees, with Figs in pots, will remain. The temperature commencing with a minimum of 50° is suitable for all; the plants are syringed daily with water which has been over the hot-water pipes for twelve hours previously. *Roses* in pots are subject to two pests, which must be watched for and checked on their very first appearance; they are the bud worm and green fly. The first must be picked out of the centre of the young shoots with a needle or pin, the fly must be destroyed by fumigating with tobacco smoke. Many varieties of *Roses* throw three times as many shoots as should be allowed to remain; these ought to be thinned-out when the growths are about 3 inches in length, a little judgment being required, so that a well-shaped plant may be produced. Removed all the late-flowering Hyacinths, Tulips, and *Polyanthus Narcissus* to the cold pit from the plunging material out of doors; many of them have made growths an inch in length. As soon as the plants were taken out a small pot was inverted over the crowns, as the sudden exposure to light and air is disastrous to the plants.

If possible, all the *Chrysanthemum* cuttings will be put in this week; those intended to form specimen plants were potted late in November, but a lengthened experience has proved to us that such early cuttings frequently run to flower in April. When this happens it is well to fall back upon the cuttings struck in January. The pots in which are the cuttings are placed for a week or ten days in a cold frame, when they are removed to a very gentle hotbed. It has been necessary to dip all the cuttings in an insect-destroying compound to kill the aphids before potting them.

## FLOWER GARDEN.

We continue to pot-off Zonal *Pelargoniums* as opportunity offers. Spring-struck cuttings of *Verbenas*, *Ageratums*, and a few other bedding plants are preferable to those struck in autumn. Batches of all such will be put in at once, and struck in bottom heat in the early Cucumber and Melon houses; it is too early yet to place them in hotbeds.—J. DOUGLAS.

## TRADE CATALOGUES RECEIVED.

Sutton & Sons, Reading.—*Suttons' Spring Catalogue and Amateur's Guide for 1874*.

B. S. Williams, Victoria and Paradise Nurseries, Upper Holloway, London, N.—*Descriptive Catalogue of Flower Vegetable, and Agricultural Seeds, 1874*.

J. C. Wheeler & Son, Gloucester, and 59, Mark Lane, London, E.C.—*"Little Book," or Select Seed List, 1874*.

J. Blackley, Leyton, London, E.—*Catalogue of Tree and Climbing Carnations, &c.*

Robert Parker, Exotic Nursery, Tooting, Surrey.—*Catalogue of Agricultural, Flower, and Vegetable Seeds, &c.*

Pine-Apple Nursery Company, Maida Vale, Edgware Road,

London, W.—*Catalogue of Kitchen Garden, Farm, and Flower, Seeds, &c.*

## TO CORRESPONDENTS.

\* \* We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.*

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

RUBUS ARCTICUS (F. R.).—Never having tasted its berries we can give no opinion relative to their excellence. Erman, in his travels in Siberia, met with them at Eragoslovsk, in Siberia. He says that it was first discovered in that district, and that the flavour of the berries is superior to that of the Strawberry, and little inferior to that of the Pine Apple.

JAMES'S PROLIFIC MARROW PEA (J., Suffolk).—The best answer to your query is the following, which Dr. Keen said in this Journal last August:—"James's Prolific is a very handsome white wrinkled variety, about 3 feet high, with fine large pods of a light green colour, containing from six to nine

James's Prolific Marrow Pea.

large peas of the finest flavour. This is a grand Pea, and ripens-off its crop pretty much at one time, so that the ground can be at once cleared for some other occupant. I am so much pleased with this Pea that I intend to adopt

it for my principal mid-season crop, sowing it at proper intervals for rapid succession." The accompanying woodcut has been sent to us by Messrs. Carter & Co., who introduced the variety.

**POTATOES FOR LIGHT SOIL (E. F.).**—You must have grown inferior varieties to have all "more or less watery." If you cultivate those which we recommended at p. 492 of last volume, you will succeed better.

**WATSON'S LAWN SAND (J. K.).**—We have not used it, therefore cannot give any evidence.

**TENANT'S TREES, TOOL HOUSE, &c. (Aconitum).**—Your predecessor had no right to remove them unless by special agreement with the landlord. Whatever you plant or erect without such an agreement will become the landlord's property.

**EXCLUDING TAME RABBITS (T. H. S.).**—A fence of galvanised wire a foot high, inclined outwards, would probably exclude them from the dower bed.

**LIST OF FRUIT TREES (A Notice).**—To give the list and the particulars you require would fill a column. Enclose five postage stamps with your address, and order "Fruit-growing for the Many." You will receive it free by post, and it contains all you ask for.

**VIOLETS OUT OF DOORS AND IN COLD GREENHOUSE (F. E. S.).**—Violets out-doors only require to have the soil enriched with some thoroughly rotten manure or leaf soil, choosing a moderately light rather than a stiff and heavy soil, it being well worked and exposed to the weather the winter before planting, which should be done in April, or early in May, in moist weather, putting in rooted runners or suckers in rows a foot apart, and that distance apart in the rows. For the convenience of attending to the plants every fifth row may be left out, which will leave an alley between every four rows of plants. The plants should be well watered at planting, and afterwards during dry weather. The ground should be frequently stirred about the plants with a hoe, the beds kept clear of weeds and the plants of runners, and in autumn they should have a mulching between the rows of partially-decayed leaves or other material, taking care not to cover-up any flower buds. The mulching should not extend an inch in thickness. The best position is an east or other border shaded from the hot midday sun. For pots, we think them best potted in September, taking-up the plants with nice balls, and potting in 6-inch or 7-inch pots, in fibrous loam two parts, and a third of leaf soil, or three parts loam to one of thoroughly decomposed manure. Place them in a cold frame, and shade from bright sun for a few days, and then remove to a light airy position in the greenhouse, taking off decayed leaves as they occur, and keeping duly supplied with water, but avoid soaking the soil sodden by frequent needless waterings; better dryness than this, especially in moist weather.

**PLANTING PAMPAS GRASS (Item).**—Keep the plants in the pots in the greenhouse, and if a cold one all the better, the pots being protected by a little hay placed over them, if the weather is so severe as to freeze the soil in the pots. Plant-out in April, making the ground rich and loose by digging, and working-in some well-rotten manure, leaf soil, or other rich compost, and if heavy add sand or old mortar rubbish so as to lighten it. Water well at planting, and in summer if dry weather prevail.

**COPING FOR FRUIT WALL (D.).**—The coping, if you intend it for protection to the blossom, should project 2 feet from the wall. It is best of glass, or wood sashes glazed, supported by iron brackets, the sashes being about 6 feet long. The drip is injurious, and troughs or gutters should receive the water and convey it clear off to one or both ends. The best angle is probably 45°. We have an idea of somewhere seeing the sort of thing you want, and it was called "Portable Fruit-tree Crymboethus," but manufacturers should advertise.

**RAISING BEET, CINERARIA MARITIMA, AND PYRETHRUM GOLDEN FEATHER (Richard).**—Red Beet for flower-garden decoration should be sown early in April, rather thinly in pans or boxes, or in a warm position out-doors, placing the plants, if in pans, in a very gentle heat, keeping near the glass, and hardening well off. *Cineraria maritima* seed should be sown in March in a gentle hot-bed, and when the seedlings are large enough to handle they should be pricked-out an inch apart in boxes, and be returned under glass and kept growing for a time, hardening well off before planting-out. The cuttings should be put-in in gentle heat in March. They are vastly superior in colour to plants raised from seed. *Pyrethrum Golden Feather* seed should also be sown early in March in gentle heat, the pans kept near the glass, and when large enough to handle the seedlings should be pricked-off in boxes about an inch apart, returned to heat, kept near the glass, and be gradually hardened-off. It will be necessary to shade, keeping rather close and moist for a few days after pricking-out until established, then admit air freely.

**MANAGEMENT OF VINERY (C. Percival).**—You may start your vinery with a minimum of 55° in February. It is not "absolutely necessary" to raise the temperature 5° when the shoots have grown a few inches. A temperature 5° or 10° higher will be necessary when the Grapes are in flower. The best surface dressing is composed of equal parts loam and rotted manure, a 6-inch potful of finely-ground bones being added to each barrowful.

**BUSH PEAR TREES FOR YORKSHIRE (A Yorkshireman).**—Dugene d'Étè, Jargonelle, Williams's Bon Chretien, Beurre d'Amanlis, Thompson's, and Knight's Monarch.

**EUCALYPTUS GLOULUS (Inquirer, Kenilworth).**—Write to Messrs. Veitch, of Chelsea, Messrs. Kollisson, of Tooting, or to any of the principal seedsmen.

**HEATING BY GAS (Uninitiated).**—We shall in an early number describe fully the mode of heating greenhouses with hot water, gas being employed as fuel.

**PEACH TREES CASTING THEIR BUDS (A Constant Reader).**—The most likely cause of the buds falling is the imperfect ripening or perfecting of the buds, it being probably retarded by the "good crop" borne last season; and the roots being in a light gravelly soil, it is likely the trees may have suffered from want of water during the growing season. The falling of the buds is frequently a consequence of keeping the trees too dry at the roots when the fruit is ripening and the growth perfecting, also too dry when at rest. It arises from an imperfect formation of the buds and inactive state of the roots, which may be brought about by too dry a soil or atmosphere and attacks of red spider; but the chief cause is the wood not being thoroughly ripened.

**BOUVARDIAS FOR GREENHOUSE (Cambridge).**—The *Bouvardias* are grown out-doors in summer, as you would see the treatment of them for that purpose at page 4 of our last week's number, also as window plants; and the reason you are surprised that in the same number the words occur "*Bouvardias* of sorts require a cool stove," from your not being aware that the latter refers to plants grown especially for winter flowering, which to bloom freely at that season require a temperature of 50° to 55° from fire heat, or a warm green-

house or cool stove. We have *B. elegans* now in flower in a greenhouse from which frost is only excluded, but the flowers do not open nearly so well as those in a warmer house. The kinds suitable for a greenhouse are *B. elegans*, *B. floribunda*, *B. Hogarth*, *B. splendens*, *B. Vreelandii*, *B. longiflora*, and *B. Davidsoni*. A few greenhouse flowering plants are—*Acacia arnuta*, *A. longiflora*, *A. mamillata*, *A. oleifolia elegans*, *Azaleas* of sorts, *Chorozema cordatum splendens*, *Coronilla glauca variegata*, *Correa Brilliant*, *Cytisus nemesios*, *Camellias* of sorts, *Diosma capitata*, *Eriostemon bixifolius*, *Gentyllis fuchsoides*, *Eutaxia floribunda*, *Libertia Reedii*, *Hydrangea japonica*, *Judigera decora*, *Kalosanthes coccinea superba*, *Labonia floribunda*, *Nerium rubrum plenum*, *Polygala Palmata*, *Valletta purpurea*, and *Witsenia corymbosa*. In our manual, "The Greenhouse," you will find a full list of greenhouse plants with their treatment. It may be had by post from our office for 10d.

**COTONEASTER SIMMONDSII SOWING (Scybor).**—The seeds should be sown in the open ground in light moderately rich soil in March, keeping them in the meantime in layers in sand; cover them three-quarters of an inch deep with fine soil. Some may come up in the first, but the majority not until the second season. It is not, that we are aware, readily raised from cuttings, but layers root freely; they may be made from now up to March. Seedling plants, from their better growth, would be preferable for a divisional hedge in gardens. *Berberis Darwinii* makes a very beautiful hedge or screen of about 4 feet high. It seeds or berries freely with us, but the birds take all of them unless the bushes are netted. Both it and *B. Aquifolium*, especially the latter, come up freely with us from self or bird-sown seeds. Plants of *Cotoneaster Simmondsii* and *Berberis Darwinii*, 9 inches to 12 inches high, may be had at a cheaper rate per hundred. We do not know where the seed may be obtained.

**INSECTS (C. R. H.).**—The insects on the leaves of your Clematis in the conservatory are females of a species of scale insect, which must be got rid of by careful examination and crushing, or your plants will soon be infested with vast numbers of young. (L. J. K.).—The minute black objects on the small twigs of your Apple trees are the eggs of a small black bark mite. It would be well to wash the twigs with a stiff mixture of lime and soap-suds.—I. O. W.

**NAMES OF FRUITS (J. Woodliff).**—The Apple sent you as the Gravenstein by the nurseryman you name has no resemblance whatever to that variety. Apple No. 2 is a local Lincolnshire variety, and known by no other name than "Old Mac." The Pear is *Gloin Morceau*. (*Portadown*).—Apples quite smashed; came in a bag, the label bearing the postmark of the above-named Irish town. Fruit should be sent in a box.

**NAMES OF PLANTS (J. W.).**—*Ruscus aculeatus*, or Butcher's Broom. So called popularly because butchers used it to brush flies from their meat. (*H. G. Chatham*).—Apparently *Pinipnella Saxifraga* var. *dissecta*, but it is never safe to name Umbellifers without fruit. (*Mac*).—1, *Lycopodium alpinum*; 2, *Polystichum aculeatum*.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### PROFIT OF POULTRY-KEEPING.

I WILL give my short experience. I may say we have a good run, except that I had to keep my whole stock penned-up for two months in the middle of the season, which I consider was a loss of about £2. I had stock to buy, which has cost me £1; food and eggs for sitting have cost £7. My receipts have been—eggs, £6 15s.; fowls and Ducks, £2 10s. Manure I put as a set-off against labour. My stock now consists of one Spanish cock and thirteen hens of last year (1873), various breeds, and twelve hens of 1872, seven Ducks, and one drake. We are now getting about four eggs per day from *Cochin* and *Brahma* pullets, which we are selling at 2d. each, so that I am disposed to think that, judiciously managed, it is anything but a losing game, as I have had all sorts of bad luck, losses of chickens by rats, &c. My advice would be, Do not set a hen on more than nine eggs, do not begin to set before March nor set any after April. I will now conclude, wishing you and your many readers a very happy new year.—SPANISH COCK.

### HENS AND CHICKENS MURDERED.

In the autumn of last year I was under medical advice, taking Homburg "Elisabethan" water, imported by Messrs. Best, Henrietta Street, Cavendish Square. It was in large bottles, packed in a hamper with some of the foreign hay in which, I understand on inquiry, Messrs. Best usually receive it from Homburg. No bottle was broken; and a few days after the hamper had been unpacked, and the bottles put away—the hamper with the hay remaining in a down-stairs passage—my cook took some of the hay to put, at their bed-time, in the sleeping-place of a healthy Silky hen with a fine brood of healthy chickens just feathered. When she went to attend to them in the morning mother and chicks were all dead. Thinking this an unaccountable fatality, and not connecting it with the use of the foreign hay which, though coarse, was sweet and dry, some more of the hay out of the hamper was used in the same way, a few days later, for a Game Bantam hen in perfect health, with a healthy brood some three weeks old or more, when the same fatality occurred, mother and chicks (the latter Silkies and White Game Bantams) being found dead in the morning. The hay in the sleeping-place and hamper was then, on the impulse of the moment, destroyed, but on mentioning the facts some weeks later Messrs. Best furnished a sample of the Homburg packing hay which I enclose.—E. J. N. H.

[We have given the hay the closest investigation we can with-

out discovering anything that can be considered deleterious, much less fatal. At a loss to account for death, we have tried to find some other cause for the sad losses. We cannot help thinking the fowls were, perhaps, smothered by being buried in hay, or that the hay was pressed too hard on the top of them. We believe you will discover some cause for death, and there can be no doubt it was the same cause in both instances.—Eds.]

### CANNOCK POULTRY SHOW.

For a first Show this proved unusually good, a great annoyance to the promoters arising, however, from the pens being sent by a mistake of the railway company to a distant station. As they did not arrive until about ten o'clock on the morning of the Show, great anxiety prevailed among the Committee, but with the willing assistance of a few amateurs who happened to be present, the birds were soon properly placed, and a collection well worth seeing resulted. Of *Spanish* the entries were numerous, and some really first-class specimens were to be met with, alike in the general and the selling classes of this variety. The *Dorkings* were good, but only two pens actually competed. In *Cochins* both Partridge and Buffs were well shown. *Brahmas* were good, and the Light-feathered cup pen particularly so; they were the good old-fashioned heavily-built pen, so well known, belonging to Mr. A. O. Worthington, of Burton. An admirable pen of Duckwing *Game* fowls were the cup-winners; they were shown in faultless condition, as indeed were some few pens of both Brown and Black Reds. A few very excellent *Hamburghs* were shown, but the classes should be divided, as in this case all breeds of *Hamburghs* competed together. A wonderfully neat pen of Red Piles were the cup-winners in the *Bantams*, and in the Any other variety Malays and Frizzled fowls received the prizes. The *Geese*, *Ducks*, and *Turkeys* were unusually good classes.

A fine collection of *Pigeons* formed a very interesting portion of the Show. Mr. Yardley, of Birmingham, sending a large entry of his best birds to secure the silver cup for the most prizes taken in *Pigeons*. This he easily accomplished.

Among the remarkable things at this first Show, a great many visitors were attracted by a Grey Cat, sent also by Mr. Yardley, in a large cage containing six of his best fancy *Pigeons*—viz., a Black Barb, a Black Carrier, a Kite, a Yellow Jacobin, a White Pouter, and a Red Turbit. So far from any aggression on the part of pussy on her involuntary associates, the *Pigeons* absolutely dispossessed her of her cushion, and then stood pruning their plumage upon it most of their time. So much for training, for this Cat is reported to be a wonderful mouser and rat-killer.

*SPANISH*.—1 and Cup, R. J. Hickman, Upper Penn, Wolverhampton. 2, S. W. Hallam, Whitwick. 3, W. Jones, Walsall.

*DORKINGS*.—1, J. Watts, Hazelwell Hall, Birmingham. 2, J. McConnell, Evesay Harold, Hereford.

*COCHINS*.—1, R. Kendrick, jun., Lichfield. 2, J. Bloodworth, Cheltenham. 3, J. Nash, Walsall. 4, H. Yardley, Birmingham.

*BRAHMAS*.—1, J. Watts. 2, A. C. Peake, Rugeley. 3, Dr. Holmes, Chesterfield. 4, R. Kendrick. 5, Pritchard, Tettenhall. 6, F. Cooper, Walsall. Light.—1 and Cup, A. O. Worthington, Burton-on-Trent. 2, J. Bloodworth, 3, J. Watts. 4, Chawner, jun., Houndhill, Uttoxeter.

*GAME*.—Black or Brown Reds.—1, Major Costabodie, Rugby. 2, J. P. Gardner, Rugeley. 3, J. P. Gardner. 4, Belt, Burton-on-Trent. Any other variety.—1 and Cup, T. Robson, Penkridge. 2, E. Bell, Earton-on-Trent. 3, Major Costabodie.

*HAMBURGHES*.—1, J. Ward, Ashby-de-la-Zouch. 2, J. Adkins, jun., Walsall. 3, T. Blakeman, Tettenhall. 4, J. R. Yates, Manchester.

*BANTAMS*.—Any variety.—1 and Cup, J. W. Smith, Beckberry, Shiffnal. 2, J. Watts. 3, J. Forsyth, Wolverhampton. 4, J. Bloodworth. 5, G. Mayfair, Cannock. 6, Yardley, G. Roden.

ANY OTHER VARIETY.—1, G. Burnell, Rugeley (Malay). 2, J. Watts. SELLING CLASS.—1, S. Cambrook, Chipping Gauden (Cochins). 2, H. Yardley. 3, H. J. Storer, Galesley, Penkridge (Dark Brahmas). 4, J. Nash, Walsall. 5, J. Adkins, jun., Walsall.

*DUCKS*.—1, H. Yardley (Whistling). 2, R. Kendrick, jun., Lichfield (Roman). 3, W. H. Crewe, Etwell; Mrs. P. S. Chirn, Sandfield, Lichfield; Lieut.-Col. Harrison, Cannock. 4, R. Fowler, jun., Birmingham.

*GEESSE*.—1, W. H. Crewe, Etwell. 2, J. Lyett, Stafford. 3, C. R. Gilbert, Cheslyn Hay. 4, R. Keeling, Congreve, Penkridge; J. Lyett.

*TURKEYS*.—1, Cup, and 3, R. Kendrick, jun. 2, Lieut.-Col. Harrison.

### PIGEONS.

*CARRIERS*.—1 and 2, H. Yardley. 3, A. Wright, Stafford.

*TUMBLERS*.—1 and 2, H. Yardley. 3, A. Wright.

*FANTAILS*.—1 and 2, H. Yardley. 3, J. C. F. Jones, Walsall.

*DRAGONS*.—1 and 2, H. Yardley. 3, W. H. A. Miller, Walsall.

*HOMING*.—1, H. Yardley. 2, G. Reaney, Bridgeton, Cannock.

ANY OTHER VARIETY.—1 and 2, H. Yardley (Yellow Barbs and Blondinettes). 3, H. P. Broom, Broomfield; C. R. Gilbert, Cheslyn Hay (Barbs); J. A. Cooper, Walsall.

*SELLING CLASS*.—1, H. Yardley (Black Barbs). 2, J. A. Cooper (Red Jacobins).

Mr. Edward Hewitt, of Sparkbrook, Birmingham, was the Judge.

**HATCHING DUCKLINGS LATE.**—My experience is in opposition to "R. W." I had a hatch of Ducks on the 29th of last July, and they did well for the first three weeks, but afterwards fell off, and at the approach of thunder or very hot weather all use seemed to leave their legs; they could not stand, they were what is called in this part "all abroad," and I only reared two Ducks out of a sitting of eleven. I would not again try to rear in the hot weather. I do not know how it might be quite in the

autumn, but I should think there would then be a difficulty in getting eggs.—WELBY, Wellington, Somerset.

### FORFAR POULTRY SHOW.

This was held in Reid Hall, Forfar, on the 1st and 2nd inst. The following are the awards:—

*GAME* (Black Red)—Cock.—1 and Cup, J. Anderson, Blairgowrie. 2, J. Henderson, Bruckley Castle. 3, R. Stewart, Blairadam. 4, J. Gault, Forfar; A. L. Fenton, Forfar; J. Jamieson; 5, Both & Tosh, Forfar; J. Morrison, Ruthven, Meigs. 6, Mrs. W. Ferguson, Inverness. Hen.—1, J. Wishart, Kirkcaldy. 2, Mrs. Morrison, Forfar. 3, J. Jamieson. 4, J. Gault; W. Badlie, Monifeth; 5, Both & Tosh. 6, D. Mason, Forfar; R. Stewart; J. Wishart.

*GAME* (Brown Red)—Cock.—1, G. Salmond, Monifeth. 2, Mrs. G. B. Laird, Birmam. 3, H. L. Horne, Ardie Hill. 4, D. Harley, Edinburgh. 5, R. Stewart. Hen.—1, C. Jamieson, Forfar. 2, T. W. Mitchell, Perth. 3, D. Harley. 4, H. L. Horne; R. Stewart. 5, W. Nicoll, Forfar; P. Symon, Errol; J. Stark, Morpet (2); Both & Tosh.

*GAME* (Any other colour)—Cock.—1, Master C. P. Jamieson, Forfar. 2, W. Bailhe, 3, D. Harley. 4, A. Laveston, Forfar; G. Jamieson. 5, W. A. Swan, Leslie; H. L. Horne. Hen.—1, D. Harley. 2, J. Jamieson. 3, J. Clark, Forfar.

*HAMBURGHES* (Spangled)—Cock.—1, Cup and 2, J. M. Campbell, New Bth. 3, W. Brough, Blairgowrie. 4, J. Mackay, Arbroath; G. J. Campbell, New Pittsburg; R. Cameron, Stewarton. 5, J. Mackay; R. Thomson, Kirkcaldy; W. M. Intosh, Blairgowrie. Hen.—1, J. M. Andrew, Carnoustie. 2, Mrs. W. Carnegie, Forfar. 3, Mrs. Brown, Crieff. 4, J. M. Campbell; R. Dickson, Selkirk. 5, W. Abel, 6, J. M. Campbell; W. Hood, Blairgowrie; W. Smith, Brechin.

*HAMBURGHES* (Pencilled)—Cock.—1, R. Dickson. 2, G. G. Cuthbert, Carnoustie. 3, A. Hannan, Balalidge Burn, Dunfermline. 4, A. Platt, Kirkcaldy. 5, J. Guthrie, Carnoustie. Hen.—1, Mrs. W. Chalmers, Hallyburton, Coupar Angus. 2, A. Hannan. 3, R. Dickson. 4, D. Milne, Forfar; H. L. Horne; Mrs. W. Chalmers. 5, G. G. Cuthbert.

*GAME BANTAMS* (Black Red)—Cock.—Cup and 1, J. Seaton, Kirkcaldy. 2, T. Ritchie, Forfar. 3, T. Barker, Jarmley. 4, A. Thon, Forfar; W. Fisher, Chacefield, Dundee. 5, J. Grieve, Grandholm Mill; G. K. Seobie, Dunfermline. 6, W. Fisher; A. Ashley, Worcester.

*GAME BANTAMS* (Any other colour)—Cock.—1, J. Anderson. 2, H. L. Horne. 3, P. Stewart. 4, A. Ashley; J. Craig, Arbroath; A. Anderson, Clunie; D. Teviotdale, Arbroath; J. Seton. Hen.—1, A. Ashley. 2, H. L. Horne. 3, J. Seton. 4, J. Anderson; T. Barker. 5, D. Kidd, Carnoustie; Miss R. Frew, Kirkcaldy; G. K. Seobie, Miss B. F. Frew. 6, J. M. Campbell.

*DORKINGS* (Dark-coloured)—Cock.—1, P. Symon. 2, D. Draper, jun., Falkirk. 3, D. Gellatly, Meigs. 4, W. Weir, Inchess, Lirber. 5, Mrs. C. Jamieson, Forfar; J. Turnbull, Falkirk. Hen.—1 and Cup, P. Symon. 2 and 3, D. Gellatly. 4, Mrs. M. Arthur, Moir, jun., Dollar; D. Draper, jun.; D. K. Kidd; D. Gellatly; J. Stark; W. M. Fisher.

*DORKINGS* (Any other colour)—Cock.—1, J. Fotheringham. 2, J. Turnbull, Plan. 3, A. M. A. Muthill. Hen.—1, Mrs. J. La, jun. 2 and 3, J. Turnbull. *BRAHMA FOOTING*.—Cock.—1, Mrs. M. Arthur, Moir, jun. 2, D. Welch, Errol. 3, J. Mitchell, Broughty Ferry. 4, J. Smart, Carnoustie; A. C. Russell, Cardross; J. Young, Kingsdown, Slateford; J. Seton; J. B. Cochrane, Stonehouse, 5, T. Barker. Hen.—1 and Cup, Mrs. M. A. Moir, Moir. 2, D. M. Whannel, Maryborough, Blairadam. 3, Mrs. W. Steven, rick, W. Duncan; J. A. Anderson, W. Falcoun, Forfar; T. Barker; J. Young; P. Symon; W. Weir; J. B. Cochrane. 5, J. Seton.

*COCHINS-CHINA*.—Cock.—1, W. Smith, Newport. 2, Mrs. M. Arthur, Moir, jun. 3, J. Wyse, Falkirk. 4, Mrs. M. Arthur, Moir, jun. (2). 5, A. Burnett, Montrose. 6, H. L. Horne. 7, J. Hay, Cossans, Glamis; J. Guthrie. Hen.—1 and 3, J. Wyse. 2, Mrs. M. Arthur, Moir, jun. 4, A. C. Russell; T. Soutar, Kirkcaldy; Mrs. M. Arthur, Moir, jun.; J. Mitchell. 5, Mrs. M. Arthur, Moir, jun. (2); Mrs. A. Mitchell, Inchture. 6, J. A. Burnett; H. L. Horne. 7, J. A. Burnett.

*ANY OTHER VARIETY*.—Cock.—1, J. Taylor. 2, W. Linton. 3, J. Smart. 4, A. M. A. 5, A. Y. Fold, Dundee. 6, J. Sanleiman, Dundee. Hen.—1, D. Draper, jun. 2, Mrs. C. B. Taylor, Montrose. 3, W. Linton, Selkirk. 4, J. A. Burnett. 5, J. A. Burnett. 6, J. A. Spence, Claverhouse. 7, J. Anderson. 8, W. Christie, jun., Liberton. 9, A. C. Russell (2); W. G. Duncan, Dundee; D. Smith, Ayrth (2); G. Cuthill; W. Nicoll; D. Dalziel; Miss Anderson, Meigs; W. Simpson, Meigs; L. L. McIlison, Ruthven; J. Laveston, Forfar. 10, J. Smart; A. Stephen, Blairgowrie; J. Mitchell; Mrs. C. B. Taylor; J. Clark, Forfar; J. Laveston. Hen.—1, W. Simpson. 2, L. L. McIlison. 3, J. Conacher, Haugh of Kilaorich. 4, W. Christie, jun.; H. L. Horne; Miss A. Anderson, Meigs.

### PIGEONS.

*POUTERS*.—1, 2, and 3, F. M. Crae, Aberdeen. 4, J. Cowe, Aberdeen.

*CARRIERS*.—1, J. E. Spence. 2, F. M. Crae. 3, A. G. Macneil, Coupar Angus. 4, J. Johnston, Loeche.

*FANTAILS*.—1, A. Falconer, Pickerton. 2, J. E. Spence. 3, A. Smith, Broughty Ferry.

*TUMBLERS*.—1, A. G. Macneil. 2, J. E. Spence. 3, W. R. Davidson, Montrose. 4, A. Falconer; J. Felt, jun., Blairgowrie; J. Day, Edinburgh.

*JACOUBS*.—1 and 2, W. & E. Davidson. 3, W. Clene, Forfar.

ANY OTHER VARIETY.—1, A. G. Macneil. 2, J. Cowie (Dragons). 3, J. Day (Tumblers). 4, E. Ireland, Brechin; J. Cowe (Archangels); J. Johnston (Owls); W. J. Steven, Montrose (Owls).

Judge.—Mr. J. Martin, Church Cottage, Clanes, Worcester.

### BALDON ORNITHOLOGICAL SOCIETY'S SHOW.

This Show was held on the 2nd and 3rd inst. in the National School rooms, which were kindly lent for the purpose. One room was used for the *Pigeons* alone, and the smaller one for *Canaries*; the entries in the latter section falling far short of those for *Pigeons*, although the classes for the former were two and a half times as numerous as the latter. The pens were on Turner's principle, uniform and neat, and the effect of the whole good, while a staff of attendants entered well to the requirements of the specimens entrusted to their care; but here again we found that the detestable sawdust covered the bottoms of all the pens.

English *Owls* were a good lot, the first prize falling to a grand old Blue cock; the second being a good Blue much younger, and the third a Silver. *Antwerps* were the great feature of the Show, four classes being devoted to that breed; and we have no hesitation in saying that such a gathering of this variety has

never been seen before. In classes where there were upwards of fifteen entries two extra prizes were very considerably allowed by the Committee, and each of these classes came in for its share of these extras. Shortfaces had thirty-three entries, some birds being of fair quality, but the majority not near the standard for that variety. The first Silver Dun, and second Blue Chequers, were fair specimens. Longfaces (cocks) were a grand display, eclipsing their Shortfaced brethren in a great degree, the birds generally being so true to colour and marking as to partake much of the ornamental appearance of the more fancy varieties; and after naming the first and second-prize winners, the first of which was Blue and the second Silver Dun, it would be difficult to particularise. The first in this also won the cup for Antwerps, and he was perhaps one of the most perfect birds ever seen, combining the sharp-cut outlines of the Carrier with the quick intelligent head of the Antwerp, and as true to colour as is possible. The second was close on the heels of the first, a clear Silver Dun with a jet-black back; the third being a Red Chequer. In hens the first was a Red Chequer, perhaps the most perfect in head properties of any hen going, the only fault being a slight redness on the cere of the eye; the second a Dark Red Chequer, and the third a Blue Chequer. As regards the head properties the medium-faced birds were a very even lot, the style, carriage, colour, and chest-development alone determining their positions. The first was a Red Chequer, second Blue Chequer and a Dark Blue Chequer. Carriers were very poor with the exception of the winners. The first a grand young Black cock, as also the second, the third being a neat Dun hen, but very young. Dragons very good, and the winners Blue, and all cocks. In Turbills a veteran Blue cock was first, a Yellow second, and a young Red hen third. Tumblers, Longfaces, were one of the best classes, and the first prize went to a good-coloured Red Mottle, second to a Blue Bald, and third to a Black. Burbs were very good, the first being a well-made-up Dun hen, second and third Black and Red cocks of great promise, although quite young. The Variety class was a puzzle in which it was difficult to feel satisfied that justice had been done, so many of the standard varieties competing. The first prize was awarded to a Blue Pouter cock, second to an Almond, and third to a Fantail, while the extras went to a Nun, a Magpie, a White Pouter, and a Trumpeter. In the Selling class Silver Owls, Antwerps, and White Pouters won.

The amount received in entrance fees for Pigeons was considerably over the outlay in prizes, which argues well for the estimation in which the Society is held, and it is to be regretted there is not a room in the village sufficiently large for a show on a more elaborate scale.

The room for the Canaries was far too small, as half the cages had to be placed too high up for a proper inspection of the birds, visitors being generally prohibited from removing a cage from the stage. The entries numbered 181, which would doubtless have been considerably increased but for the counter-attractions of Barton-on-Humber, Manchester, Hexham, Dewsbury, and South Shields. It is to be regretted that so much "clashing" had not been timely avoided.

Belgians were first on the list, and with the exception of the winning Yellows were of the "stiff" variety, and lacked that elasticity which always accompanies high-class birds. They were, too, so persistently restless as to render judging a difficult task. Steadiness is always desirable in any cage bird, but in Belgians it is indispensable, and we would strongly urge fanciers to bear this in mind.

The Clear Norwich were of the new gaudy colour, all six prizes going to the celebrated Derby firm.

In the Evenly-marked Norwich class Yellows and Bufts competed together, the first prize falling to a Buff—the best "all-propertied" Norwich in the Show, and the second and third to Yellows.

One class for Ticked or Unevenly-marked Norwich brought together some fine specimens, the first a Ticked Buff, most rich in colour, but rather "washed" in the neck; the second a rather heavily-marked Buff, not so high in colour, but a perfect model of a Norwich Canary, and rarely is such a bird seen; the third was a good Yellow.

Crested Norwich were good; first was a Buff hen, soft in feather and low in colour, but with a magnificent dark crest; second a high-coloured Yellow cock, and the third a large-crested Buff cock. This class (S. Tomes, No. 4) contained a grand stock bird.

Coppies, Yellow, were well shown; first a fine Clear cock, second a full grey-crested hen, and third a cock.

Coppies, Buff, were fine birds, but, as a class, scarcely equal to the Yellows. The winning Lizards were good in colour, but rather small, and too narrowly built, especially the Golden birds.

The Clear Yorkshires were very fine, but it should be remembered these birds have most distinctive characteristics, and are neither good-feathered "Cuppy Plainheads" (as they are termed), nor yet Elongated Norwich.

The Evenly-marked Yorkshires were the great feature of the

Show. They were really splendid birds, the winners in each class being literally perfect in their markings; every bird was worthy of a prize. The winning birds were clear.

Cinnamons had been all moulted under the new régime. The first and second honours in Variegated Cinnamons were taken by beautifully marked Yorkshires, and the third by an evenly but rather heavily marked high-coloured bird, an old warrior, and evidently much distressed by his battles.

The cages of six were well selected, and almost on a par.

The Selling class contained some good and cheap birds. First was a large Silver Lizard cock (should have been in his own class); second a Ticked Yellow Belgian hen; and third, a useful Crested Norwich cock.

Goldfinch Mule, Clear or Variegated. First, a well marked Jonque, full of quality, and will still improve; second, an evenly-marked but rather grizzily-flighted Mealy, apparently much jaded by laurel-winning; and third, a slightly but unevenly marked Jonque, perfect in shape, but short of finish. The illogical "nearest the Canary" theory, would, of course, have placed this bird first. Goldfinch Mule, Dark, one entry, a fine Jonque bird.

There was nothing extraordinary among the Linnet Mules, although it is a difficult matter to breed a bird as good as the first, or so large as the third. In Any other variety of Mule the prize went to a beautiful Bullfinch and Goldfinch, showing well the colour of each bird, especially the "flourish" of the latter. The winning Goldfinches, Bullfinches, and Linnets were good, especially the first-prize Bullfinch, which was a beauty.

A splendid Starling, a remarkably tame and well-shown Missel Thrush, and a handsome Brambling took the prizes in the Variety class in the order named. There was also a pair of Snow Buntings, rarely seen at an exhibition. They are birds of soft, delicate, but unpretending plumage, and on this account scarcely eligible for successful competition in a miscellaneous class.

#### PIGEONS.

OWLS.—English.—1, S. E. Seanoor, Leeds. 2, J. Rhodes, Horton, Bradford. 3, Ward & Rhodes, Otley. *che*, G. E. Sawdon, Sutton, Cross Hills: Ward and Rhodes. *he*, W. Ridge, Bradford; W. Harcastle, Embsay; E. Rhodes.

SCOTTISH.—Short-faced.—1, J. Gardner, Preston. Ext. 2, J. Hutton, Idle. 3, W. Ellis, Bingley. Leeds. Extra 3, P. Joy, Walmgate, York. *che*, W. Harcastle, Bingley. 1, Gardner. *he*, J. Bishop, Skipton; E. Davey, Baildon; W. Ellis; P. Joy; R. Sharp, Lower Baildon. 2, J. Hutton, Baildon.

ANTWERPS.—Long-faced.—Cock.—1, W. Land, Shipley. 2, H. Jennings, Alerton, Bradford. Extra 2, E. Monsey, Low Moor. 3, W. Ellis; H. Mitchell, Bingley. *che*, P. Jewett, Edwicks, Embsay; T. Slater, Bingley; A. Johnson, Bradford; H. Jennings; J. Sparrow & Co., London (2). *he*, W. Ellis (2). *he*, Hutton, Idle; G. Hargreave, Baildon; D. Davey, Baildon; J. Mann, Baildon; D. Webster, Baildon; G. W. Watson, Baildon; C. Hutton, Baildon. Hen.—1, H. Jennings. 2, W. Ellis. 3, Burston & Clayton, Gillingham, Bradford. *che*, J. Bishop, Skipton; J. Wood, Alerton; E. Monsey. *he*, W. Ellis; T. Cordingley, Bradford; A. Johnson, Bradford; H. Jennings; J. Pearce, Burton-on-Trent. *he*, H. Ingle.

ANTWERPS.—Medium-faced.—1, W. Land. 2, H. Jennings. Extra 2, W. Ellis. 3, J. Foster, Denbigh, Bingley. Extra 3, J. Robinson, Baildon. *che*, W. Gopley, Baildon; W. Ellis; H. Mitchell; H. Jennings. *he*, W. Ellis; Burston and Clayton; H. Mitchell (2). *he*, W. Blingworth, Alerton.

CARRIERS.—1, J. Hawley, Gillingham, Bradford. 2, S. E. Seanoor, Leeds. 3, J. Radlin, Leeds. *he*, D. Riddough, jun., Bradford; J. Pearce, Burton-on-Trent. *he*, D. Riddough; J. E. Mason, Shipley; J. Hawley.

DRAGONS.—1, Burston & Clayton. 2, G. W. Dutton, Chester. 3, G. E. Sawdon. *che*, W. Land; H. Jennings. *he*, H. Ingle (2). P. Joy; H. Jennings; Ward & Rhodes, Otley; J. Brearley, Wootton, Windhill; Burston & Clayton. Turbills.—1, 2, and 3, H. Ingle. 2, W. Land. *che*, H. Jennings. *he*, J. Pearce; H. Mitchell; J. E. Mason; J. Hawley.

TUMBLERS.—Long-faced.—1, 2, and 3, D. Riddough, jun. 3, W. Walker, Baildon. *he*, D. Riddough, jun.; A. & J. Wells, Ripon (2). *he*, J. S. Robinson, Baildon.

BARRIS.—2 and 3, J. Thresh, Bradford. *che*, S. E. Seanoor (2). *he*, D. Riddough, jun.; H. Jennings (2). *he*, G. E. Sawdon.

LOVERS.—1, J. Hawley, Gillingham, Bradford. Extra 2, S. E. Seanoor. 3, J. F. Loversidge, Newark. Extra 3, D. Riddough, jun. Extra 4, H. Mitchell. P. Joy. *che*, W. Land; H. G. Poole; G. E. Sawdon; J. Thresh; S. E. Seanoor. *he*, J. Pearce; G. E. Sawdon; J. Thresh; S. E. Seanoor. *he*, A. & J. Wells; J. F. Loversidge.

SELLING CLASS.—1, W. Ellis. 2, J. Lancaster. Extra 2 and extra 3, J. Hawley. 3, W. Ridge. *che*, P. Posselt, Shipley. *he*, W. Ellis; W. Land; J. Mers, Baildon. *he*, D. Riddough, jun.; Burston & Clayton; P. Posselt.

#### CAGE BIRDS.

BELGIAN.—Clear Yellow or Ticked.—2, Anderson & Fawcett, Baildon. 3, R. Hawman, Middlesbrough. *he*, R. Smith, Crosshills. Clear Buff or Ticked.—1, R. Hawman. 2, W. Shackleton, Hildes. 3, J. Stark, Crosshills. *he*, W. and M. Boston, Leeds.

NORWICH.—Clear Jonque.—1, 2, and 3, Orme & Bemrose, Derby. *he*, C. Bexson and Lamplough. Clear Buff.—1, 2, and 3, Orme & Bemrose. *che*, Bexson and Lamplough.

NORWICH.—Evenly-marked Yellow or Buff.—1 and 2, Orme & Bemrose. 3, S. Tomes, Northampton. *che*, Bexson & Lamplough. Ticked or Unevenly-marked Yellow or Buff.—1, 3, and *che*, Orme & Bemrose. 2 and *he*, Bexson & Lamplough. Crested Yellow or Buff.—1 and 2, Orme & Bemrose. 3, J. Duvaly, Knarborough. *he*, S. Tomes; Bexson & Lamplough.

COPY.—Yellow with Clear or Grey Crest.—1, 2, and *che*, W. Hutton, Baildon. Leeds. 3, W. Shackleton. *he*, W. Hutton; D. Hingworth, Hertsford. Buff with Clear or Grey Crest.—1, Anderson & Fawcett, Baildon. 2, O. Paley, Baildon. 3, J. Potter, Bradford.

LIZARD.—Golden-crested.—2 and 3, R. Ritchie, Darlington. *he*, W. & M. Boston, Leeds. Silver-crested.—2 and 3, R. Ritchie. *he*, S. Tomes; M. Houghton, Bradford.

YORKSHIRE.—Clear Yellow.—1, W. Hutton. 2, W. Shackleton. 3, J. Cock-shott, Fearncliffe, Bingley. Clear Buff.—1, W. Hutton. 2 and 3, Anderson and Fawcett. Extra 3, O. Paley.

YORKSHIRE.—Evenly-marked Yellow.—2, L. Belk, Dewsbury. 3, J. Stevens, Middlesbrough. *che*, R. Havason, Darlington. Evenly-marked Buff.—1, L. Belk. 2 and 3, D. Gay, Gillingham, Bradford.

YORKSHIRE.—Ticked or Unevenly-marked Yellow.—1, J. Garbutt, Northallerton. 2, J. Lupton, Baildon. 3, W. Hutton. *he*, S. Hainsworth, Farsley. Ticked or Unevenly-marked Buff.—1, J. Stevens. 2 and 3, G. Golt, Shipley.

CINNAMON.—Jonque.—2, Bexson & Lamplough. 3, Orme & Bemrose. *che*, Bexson & Bemrose; Bexson & Lamplough. Buff.—1 and 2, Orme & Bemrose. 3, Bexson & Lamplough. Marked or Variegated.—1, L. Belk. 2, 3, O. Paley. Orme & Bemrose. *che*, P. Rawnsley; Bexson & Lamplough (2).

In *Cochins* the winners were a splendid lot, Buffs being first and third, with Partridge second. *Brahmas* were mostly Dark, although the third prize was awarded to Light. The excellence of the first-prize pair may be easily understood when it is seen that Mr. Watts's bird only received second honours. The cup was awarded here. *Dorkings* were a grand lot; the first old birds of enormous size, the second chickens, good in all respects, and third also a good old pair. *Spanish* poor except the winners; the first being chickens of grand quality, the pullet beating the second one entirely, while the cockerels were about equal in merit. Next came *Game*, Black or Brown Reds, many of the birds showing the ugly Malay parentage, the awards being made to Game of the true type, style, and colour. The first and cup were grand-coloured Black-breasted Reds, second Brown Red chickens of splendid quality, and third also Brown Reds. One of the best cocks in the Game classes was the first-prize Duckwing, his pullet also being grand in all points except tail, which was badly grown and rather up; the second also old Duckwings, and third Pile chickens, which were, however, rather too fine in bone. Red Game *Bantams* were a grand class, the first an old pair, almost perfect in all points and in the highest possible condition, while the second, quite as good, were not in good order; the third being a pretty pair of chickens. In any other Game the first and third were Piles and second Duckwings, all being good, and the first-named pen very small. *Bantams*, not Game, were first Blacks, second Golden-laced, and third a pair of Nankins, which, however, were a little short of colour. *Hamburghs*, Gold-spangled, were a fair lot; Silvers very good, as also the winning Gold-pencils, but the Silver-pencils were a poor assortment, while *Polands* were such a gathering as is seldom seen in the north of England, Golden winning first and cup, and Silvers second and third.

*Aylesbury Ducks* were all of nice quality, as also the winning Rouens, the cup for this section being awarded to a grand pair of that variety, while very good Brown and White Decoy, domesticated "Wild," and Carolinas came in for other prizes and commendations.

The entries in the Selling class were very large, and several pens were sold, the first prize going to Buff *Cochins*, second to Brown Red Game, and third to *Dorkings*.

*Cage Birds* were also a good entry, but the birds in some classes were poor, this remark applying to the Belgians, except the winners, the Crested, and the Yorkshire varieties. In Norwich, Clear or Ticked, a grand Clear Jonque won first as also the cup for the best bird in the Show, the Even-marked birds proving very good in marking and mostly four-pointed birds. In Mules, any variety, the first was a variegated Linné Mule, and the second a small Clear Buff Goldfinch hen bird, not, however, in full feather. There were some handsome moulted Goldfinches, but others were very poor, and the Linnets were a fair lot, the winners in the Variety class being a Canadian Goldfinch, a bird not unlike a Siskin and Canary Mule, and second a green Parakeet.

*Pigeons* were numerous, a grand display, and beautifully placed on long tables in another large room of the Hall. The Pouter classes were very good, the two winners in cocks, the first a Blue and second a White, grand in style and limb. With the exception of the winners the Carriers were not good, but the cup for the high standard section was awarded to a Black cock. Almond Tumblers good, as also the Long-faced Balts. Antwerps, both Long and Short, were a fine display, and the cup well awarded against Dragoons, as well to a grand old Red-chequered cock of the Short-faced variety; the next class in point of merit being the Fantails, which were an exceeding grand display.

*Cochins*—1 and 3, G. H. Procter, Durham. 2, J. Bell, Thirsk. *hc*, W. Jaggs, Blyth; W. Harvey, Sheffield.

*Brahmas*—Cup, W. Swann, Bedlington. 2, J. Watts, Birmingham. 3, T. Webb, Coldfield. *hc*, H. Davison, Durham. *hc*, J. H. Davison, Newcastle; W. Swann; W. Sanderson, Newcastle; J. Nesham, West Slesburn Colliery. *c*, R. Shield, Swallow; C. J. B. Young, Darlington; T. Webb.

*Dorkings*—1, J. White, Hexham. 2, W. Harvey. 3, W. Swann. *hc*, W. Swann; R. Reed, Canonbie. *hc*, J. Coulson, Shoddy Bridge; Miss M. J. Nelson, Hexham.

*Spanish*—1, R. Newbitt, Epworth. 2 and 3, J. Youngshusband, North Shields. *hc*, J. Willoughby, Hexham; F. E. Schofield, Morpeth; W. Jaggs.

*Game* (Black or Brown Reds)—1 and Cup, W. Youngshusband, Darlington. 2, J. Young, Bishop Auckland. 3, Webster & Adams. *hc*, J. Waller; R. White, Hexham; M. Bainbridge, Durham; Miss M. J. Nelson; E. Akroyd, Leeds. *hc*, J. Robson; R. Millican, Green Head; J. Stewart; Miss M. J. Nelson; J. W. Gilchrist, Bedlington. *c*, T. Brown, Nenthead; Miss M. J. Nelson. *Game* (Any other colour)—1, E. Akroyd. 2, M. Bainbridge. 3, T. Goldsmith, Dudley. *hc*, W. Dalton, Carlisle. *hc*, R. Newbitt; W. Youngshusband. *c*, T. Brown; E. Wilson.

*Game Bantams* (Black or Brown Reds)—1, Miss M. J. Nelson. 2, E. Newbitt. 3, W. Gray, Tow Law. *hc*, W. Murray, Hexham. *hc*, G. Bell, Morpeth; Wardle & Bruce, Newcastle; R. White; W. Murray; Webster & Adams. *c*, E. Ruddy, Hexham.

*Game Bantams* (Any other colour)—1 and 2, Miss M. J. Nelson. 3, J. Hamilton, Hexham. *hc*, R. White; J. E. Murray, Hexham; Miss M. J. Nelson; Webster & Adams. *c*, T. Ayre, Durham; T. Pearson.

*Bantams* (Any other variety, except Game)—1, R. H. Ashton, Manchester. 2, J. Watts. 3, J. C. Milner, Bishop Auckland. *hc*, T. P. Carver, Borough Bridge. *hc*, H. Civil, Hexham; J. Nesham; R. H. Ashton. *c*, J. W. Civil.

*Hamburghs* (Gold-spangled)—1, R. Keenleyside, Darlington. 2, J. Forster, Tow Law. 3, G. Stalker, Bedlington. *hc*, M. S. Sherwin, Carlisle.

*Hamburghs* (Silver-spangled)—1, F. E. Schofield. 2, Ashton & Booth, Mottram. 3, G. Stalker, H. Stanworthy, Burnley.

*Hamburghs* (Golden-pencilled)—1, F. E. Schofield. 2, Miss Elliott, Newcastle.

D. Waller, Hexham. *hc*, J. J. Millican, Alston. *c*, A. Stephenson, Dindley Colliery.

*Belgians* (Silver-pencilled)—Medal, J. Forster. 2, J. Nicholson, jun., Carlisle. 3, R. Pickering, Stubby Lodge.

*Pouter*—Medal and Cup, Parsons & Wilson, Bedlington. 2 and *hc*, T. Webb.

3, W. Ridley. *hc*, W. Harvey; G. W. Boothby.

*Barn Door Fowls*—Medal, E. Barker, Stokesley. 2, T. W. Clementson, Hexham. 3, F. E. Schofield. *hc*, J. Rewcastle, Hexham.

*Any other Variety*—Medal, Miss Elliott. 2, C. J. B. Young, Newcastle. 3, Parsons & Wilson.

*Duck* (Aylesbury)—Medal, T. P. Carver. 2, C. Holt. 3, R. Reed. *hc*, Miss C. A. Wright, Bedlington. *c*, J. G. Milner.

*Ducks* (Any other variety)—Medal, Cup, and 2, Miss M. J. Nelson. 3, A. T. Umpleby, Borough Bridge. *hc*, J. Coulson; G. Stalker. *hc*, T. W. Carrick, jun., Whitfield; J. M. Lowrey, Corbridge.

*Selling Class*—Medal, 1, B. J. Baty, jun., Hexham. 2, Guthrie & Hope, Hexham. 3, A. T. Umpleby. *hc*, W. Swann. *hc*, J. Ridley, Hexham; J. G. Milner; J. Coulson; 1, B. J. Baty, jun.; E. Walker; W. Newton; G. Stalker; Miss M. J. Nelson; G. H. Procter. *c*, T. Brown; J. Nicholson, jun.; J. M. Lowrey; G. Horder, Alston; R. Reed.

#### PIGEONS.

*Pouters*—Cocks.—Medal, R. Blacklock, Sunderland. 2, W. Newton, Hexham. 3, T. Rule, Durham. *hc*, R. White; G. J. Taylor, Huddersfield. *hc*, W. Ridley; P. R. Spencer, Hereford; T. Rule; R. Blacklock; A. Spencer, Driffield (2); G. J. Taylor; Guthrie & Hope; J. Grant, Edinburgh.

*Pouters*—Hens.—Medal, M. Temple, Hexham. 2, G. J. Taylor. 3, T. Rule. *hc*, R. White; J. Dye, Hexham; *hc*, E. Beckwith, Sunderland (2); J. R. Forbuck; J. Dye. *c*, E. Beckwith; Guthrie & Hope.

*Carriers*—Cocks.—Cup and Medal, G. P. Taylor. 2, P. R. Spencer. 3, G. Sailer, Borough Bridge. *hc*, W. Ridley.

*Carriers*—Hens.—Medal, M. Temple. 2, P. R. Spencer. 3, S. D. Baddeley. *c*, P. Wild, Manchester.

*Tumblers*—Young.—Medal and 2, H. B. Massey, Spalding. 3, G. J. Taylor. *hc*, W. Ridley (2); H. A. Ayton, Saltburn by the Sea.

*Tumblers* (Short-faced)—Medal and Extra 2, T. Rule. 3, W. Brydone, Dunse. *hc*, J. Gardner. *hc*, W. R. & H. O. Blenkinsopp, Newcastle; E. Beckwith (2); W. Harvey. *c*, W. Setton; G. J. Taylor.

*Tumblers* (Long-faced, Almonds)—Medal, E. Prudden, Hexham. 2, R. Blacklock. Extra 2, T. A. Towns, Blaydon. 3, T. W. Clementson. *hc*, M. Green, Leeds. *hc*, J. Dye (2); M. Green.

*Tumblers* (Long-faced, Balts)—Medal and 2, D. Riddough, jun., Bradford. 2 and 3, W. Hill, Manchester. *hc*, W. Hill; J. Watts. *hc*, E. Walker; A. Jackson, Bolton-le-Moors (3); G. J. Taylor; A. J. Sticks, Newcastle.

*Tumblers* (Long-faced, Beards)—Medal, H. A. Sticks. 2, W. Hill. 3, J. Murray. *hc*, J. Dye (2). *c*, J. Dye; J. Chadwick, Bolton.

*Tumblers* (Long-faced, any other variety)—Medal, W. Harvey. 2, W. A. Rids, Ashton-under-Lyne. 3, J. Dye. Extra 3, W. R. Mapplebeck, Birmingham. *hc*, W. Hill. *hc*, J. B. Mapplebeck, jun.; T. W. Clementson; W. B. Mapplebeck, jun. (2). *c*, D. Riddough, jun.; W. Hill (2).

*Antwerps* (Long-faced)—Medal, T. W. Clementson. 2, A. N. Podd, North Shields. 3, A. Webster, Leeds. *hc*, A. Webster; C. F. England, Stroud. *c*, J. King, Newcastle.

*Antwerps* (Short-faced)—Medal, J. Lister, Keighley. 2 and Extra 2, W. Gamon, Chester. 3 and *c*, J. Gardner, Preston. *hc*, C. F. Copeman, Birmingham. *hc*, J. Lister; W. Gaudin; G. J. Taylor.

*Columbs* (English)—Medal, N. Donaghy. 2, J. Gardner. Extra 2, J. Chadwick. 3, T. W. Clementson. *hc*, W. Hill, Whitfield. *hc*, J. Dye; F. Wild, Hyde; T. W. Clementson; Halliwell & Thompson. *c*, J. Thompson, Bingley.

*Dragoons* (Blue or Silver)—Medal and 2, W. Gamon. Extra 2 and 3, Guthrie & Hope. Extra 3 and *hc*, J. G. Dunn, Newcastle. *hc*, W. Setton; W. Hill; G. H. Greaves, Blackburn. *c*, T. W. Clementson; W. Hill.

*Tumblers* (Any other colour)—Medal, 2, Extra 3, and *hc*, W. Hill. 3, T. A. Towns. *hc*, J. Watts; A. Jackson; W. Harvey; J. Chadwick; W. Hill; J. Thompson.

*Jacobins*—Medal and Extra 3, G. J. Taylor. 2, W. Croft, Ripley. Extra 2 and 3, T. Rule. *hc*, J. Thompson. *hc*, W. R. & H. O. Blenkinsopp; J. Young; W. Harvey, Shafeld; J. Murray, Newcastle; W. Brydone, Halliwell & Ingram, Halifax.

*Chebbits* (Shell-crowned)—Medal, G. J. Taylor. 2, T. Gallon; M. Green. 3, T. Podd, Hexham. *hc*, W. Croft; T. Gallon; J. Young; O. E. Cresswell, Early Wood, Bagshot.

*Turbits* (Point-headed)—Medal, J. Dye. 2, G. J. Taylor. 3, G. Cutler. *hc*, M. Green; R. Robson, jun., Newcastle; O. E. Cresswell; J. Gardner; G. Cutler. *c*, R. Robson, jun.

*Fantails*—Medal and 3, T. Rule. 2, A. Smith, Broughty Ferry. *hc*, W. Hill; J. F. Leversedge, Newark.

*Any other Variety*—Medal, Cup, and 3, G. J. Taylor. 2, T. Rule. *hc*, W. R. & H. O. Blenkinsopp; W. Brydone; F. Wild. *hc*, J. Young; E. Beckwith; F. Wild; J. P. Fawcett, Whitby; W. Hill; T. Gallon.

*Selling Class*—Medal, M. Green. 2, G. J. Taylor. Extra 2, H. B. Massey. 3, W. Brydone. Extra 3, J. Blanshard, Driffield; Guthrie & Hope. *hc*, W. Harvey; W. Setton, Blackburn; Mrs. Clennell, Morpeth; J. & W. Towerson, Whitehaven; J. Thompson; Guthrie & Hope; W. P. Mapplebeck, jun. *hc*, J. Blanshard; G. J. Taylor; M. Green; Halliwell & Ingram.

#### CAGE BIRDS.

*Belgians* (Clear or Marked)—1 and 2, J. Rutter, Sunderland. *hc*, T. Brown.

*Norwich* (Clear or Marked)—1, J. Baxter, Newcastle. 2, T. Tenniswood, Middlesbrough. *hc*, W. & C. Burniston, Middlesbrough; J. & J. Shield, Leadgate. *c*, R. Hawman, Middlesbrough.

*Crest* (Any variety)—1, J. Baxter. 2, T. Jobling, Middlesbrough. *c*, C. Robson, Killingworth.

*Lizard* (Gold and Silvers-spangled)—1, W. & C. Burniston. 2, J. Baxter. *c*, J. & J. Shield.

*Any Bred* (Even-marked)—1, J. Baxter. 2, R. Gilhespie, Blaydon. *hc*, W. & C. Burniston; J. Baxter; J. Gilhespie, Blaydon.

*Columbs* (Yellow or Buff)—1 and 2, W. G. Hampton, Darlington. *hc*, R. Hawman; J. Baxter. *c*, J. Rutter.

*Yorkshire* (Clear or Ticked)—1, J. Baxter. 2, J. & J. Shield.

*Green*—1, R. Hawman. 2, J. Spence, South Shields. *hc*, J. & J. Shield.

*Mule* (Any variety)—1, J. Spence. 2, R. Hawman. *hc*, T. Tenniswood; J. Barker. *hc*, J. & J. Shield. *c*, J. Williams, Whitehaven.

*Goldfinch* (Moulted)—1, W. Kenwick, Blaydon. 2, J. & J. Shield. *hc*, J. Gardner, Greenhead; J. Murray.

*Goldfinch* (Moulted)—1, G. J. Taylor. 2, J. Maddison, Hexham. *hc*, J. Williams; W. Cartick, Middlesbrough; M. Smith, Gateshead; J. Spence.

*Any other Variety*—1, G. F. Hedley, Hexham. 2, N. L. Cooke, Hexham. *hc*, Mrs. Clennell. *hc*, T. Welch, Hexham; W. G. Hampton.

*Collection of Six Canaries*—1, J. Barker. 2, W. G. Hampton. *hc*, Mrs. Clennell. *c*, J. & J. Shield.

*Judges*.—Poultry: Mr. E. Hutton, Pudsey. *Pigeons*: Mr. J. Hawley, Gillingham. *Cage Birds*: Mr. T. Lowrey, Gateshead; Mr. E. Hutton.

*SPALDING COLUMBARIAN SOCIETY*.—This has just been established, and its members are to be exclusively amateurs, the object being to have monthly meetings to afford opportunity to show and discuss the merits of the higher classes of Pigeons. The Society purposes holding an annual public exhibition of

single birds. The rules seem to be good, and we should like to hear of many such societies.

## POUTERS—ANY OTHER COLOUR OR MARKING CLASS.

I AM very sorry to see this class of Pigeon spoken against at our shows by such an able writer as "WILTSHIRE RECTON," and am pleased to see from a more able pen than mine in "James Hume" taking the matter up. Without these birds the grand shape and length of the Pouter would in time be lost. Committees might just as well think of doing away with the "Any other variety" class in Tumblers, for in this class do we not see the grandest birds for head, beak, and carriage, while for colour they are lost? Agates, for instance, are all shades of colour, but what would the pretty Almond do without them? Again, in Silver Dragons are they not an offshoot of the Blue; but all breeders are bound to have them in their loft, or in time what would become of that bright colour we now see in Blues? Therefore, let all birds that improve a breed have a class at our great shows.—GO-HEAD.

## MANCHESTER ORNITHOLOGICAL SOCIETY'S SHOW.

This Exhibition of Canaries, Mules, and British and foreign birds was held in the Cotton Waste Exchange, Market Place, Manchester, on January 1st, 2nd, and 3rd.

**BELGIAN.**—*Clear, Ticked, or Variegated Yellow*.—1, R. Hawman, Middlesbrough. 2, Bunting & Keys, Derby. 3, W. Haydon, Ormskirk. (The entire class very highly commended.) *Clear, Ticked, or Variegated Buff*.—1, J. Hart, Stalybridge. 2, J. H. Rodgers, Liverpool. 3, J. Shatwell, Macclesfield. (The entire class very highly commended.)

**NEWBORN.**—*Yellow or Yellow Ticked, high colour*.—1, Withheld. 2 and 3, Bemrose & Orme, Derby. *Buff or Buff Ticked, high colour*.—1, Withheld. 2, 3, and 4, Bemrose & Orme. *Yellow or Buff Variegated, high colour*.—1, Withheld. 2, 3, and 4, Bemrose & Orme.

**NOBWIN.**—*Yellow or Yellow Ticked*.—1 and 3, Bemrose & Orme. 2, I. Adams, Coventry. *Yellow or Buff Variegated*.—1, J. Adams (3). *he, S. Roberts and H. Fitch, Derby*; G. Golly.

**NOBWIN.**—*Yellow or Buff Variegated*.—1 and 3, Bemrose & Orme. 2, he, J. Adams. *he, H. & D. Audley*; J. Adams; Bemrose & Orme.

**LIZARD.**—*Golden-spangled, with Clear Cap*.—1, B. Harrison, Oldham. 2, T. Smethurst, Oldham. 3, W. Watson, jun. *Yellow or Yellow Ticked*.—1, J. Shatwell, Oldham. 3, W. Watson, jun. *Buff or Buff Ticked*.—1, J. Shatwell, Oldham. 3, W. Watson, jun. *Clear Cap*.—1, W. Watson, jun. 2, J. Martin. 3, J. Shatwell, Oldham. *he, Bunting & Keys*; W. Watson, jun.; T. Smethurst; B. Harrison. *he, J. H. Rodgers*; T. W. Fairbairn, Canterbury. 3, J. McGregg; J. Hickton.

**LIZARD.**—*With broken cap, pied wing or tail—Golden-spangled*.—1, Withheld. 2 and 3, W. Watson, jun. *Silver-spangled*.—1, T. W. Fairbairn. 2, W. Watson, jun. *Bunting & Keys*. *he, J. Stephens*, Middlesbrough. *he, Rev. V. Ward*, Hythe. 3, Rev. V. Ward; W. Watson, jun.; T. Smethurst.

**LIZARD.**—*Gold or Silver-spangled—First Cage of six*.—1, T. Smethurst. 2, J. Shatwell. 3, W. Watson, jun. *he, Rev. V. Ward*; J. Shatwell. *he, T. W. Fairbairn*.

**MANCHESTER COPY.**—*Clear Yellow or Ticked Crest*.—1, Withheld. 2, T. Smethurst. 3, B. Harrison. *Clear Buff or Ticked Crest*.—1, J. Schofield. 2, B. Harrison. 3, T. Smethurst.

**PLAIN HEADS.**—*Clear Yellow or Ticked*.—1, J. Shatwell. 2, B. Harrison. 3, T. Smethurst. *Clear Buff or Ticked*.—1, T. Smethurst. 2, J. Schofield. 3, J. Shatwell. *he, B. Harrison*. *he, W. Armstrong*, Salford.

**GULLFLECK AND CASSIN.**—1, R. Harrison. 2, J. Goode, Leicester. 3, Bates, Schellberg. *he, H. Ashton*, Prestwick; J. Whitaker, Bradford.

**DARK.**—1, Bemrose & Orme. 2, W. Ashworth, Derby. 3, Bunting & Keys.

**LINNET AND CANARY MULE.**—*Yellow or Buff Variegated*.—1, Withheld. 2, J. Stephens. 3, J. Stephens. *South Shields*. *he, W. Hulton*. *Dark*.—1, J. Stephens. 2, J. H. Harrison. 3, W. Hulton, Randon, Leeds.

**MULE.**—*Any other variety*.—1, W. Hulton. 2, J. Brown, jun., Penrith. 3, R. Harrison. *he, B. Lancaster*, Shipley, Leeds.

**GULLFLECK.**—1, J. N. Harrison. 2, W. Hulton. 3, J. Martin. *he, Rev. V. Ward*. W. M. Grove, Stoke-on-Trent; Bunting & Keys (2); Wilson & Irons, Liffle use (2); J. Stephens; J. Goode; B. Harrison; J. Whitaker; J. Martin.

**LINNET.**—*Green*.—1, R. Harrison. 2 and 3, W. Carriek, Middleton. *he, J. Hulton*. *he, Bunting & Keys* (2); J. N. Harrison, Belper.

**BRITISH BIRD.**—*Any other variety*.—1, Withheld. 2, W. & C. Barniston, Middlesbrough. *he, J. A. Allsopp*.

**FOREIGN.**—*Any variety*.—1, Bunting & Keys. 2, J. Shatwell. 3, J. Cornthwaite, Pendleton.

**JUDGES.**—Mr. G. J. Barnesby, Derby; Mr. G. Tuckwood, Nottingham.

## LONDON FANCY CANARY CLUB.

The annual Show took place on January 1st, at the City Arms Tavern, Blomfield Street, London Wall. The following is a list of the awards:—viz.:

**JOHNIE COCKS.**—1, — Waller. 2, — Clarke. 3, — Hooke. *Hens*.—1, — Clark. 2, — Hooke.

**MEALY COCKS.**—1, — Brodick. 2, — Hooke. 3, — Clark. 4, — McMillin. *Hens*.—1, — Clark. 2, — Waller.

**JUDGE.**—Arthur Willmore, Esq.

## BEE-KEEPING IN 1873.

I HAVE read with very great pleasure the letters from the pen of my friend Mr. Pettigrew, also the controversy between Mr. Pettigrew and "B. & W." respecting the first stage of honey gathered by the bees when it is in its crude state. I found it

out by accident on removing a bar out of a Woodbury some time ago. I found it exactly as described.

With regard to the bee glasses which have been so ably written about, I think it is within the reach of the poorest man to collect honey in them, and it can be sold at double the price of run honey. Last year was a blank with me for bell-glasses, and will long be remembered by bee-keepers.

I began the year with sixteen stocks, had about eight swarms, and had on December 10th only twelve stocks, having joined some three together, some two, according to the strength of each, and in addition I have given about a hundredweight of sugar.

It was very unfortunate that the first great show of bees and honey in Manchester should have taken place in such a bad year for bees, but nevertheless it was a grand show, and I hope it will be the forerunner of many more. At any future show I should like to see honey proper gathered from the flowers only, but in 1873 this could not have been done in England, but the result was a proof of what can be effected in bee-culture. If the horticulturist can produce his bunch of grapes weighing 16 lbs., why not the apiarist his crystal palace of honey or of bees? I may just say that I was the winner of the first prize for the most ornamental hive at the show at Manchester, and had I fed the bees I could have made it much better.

On referring to our Journal of October 23rd, in answer to "C. H. E.," you give a perfect description of my prize hive, and you say it is perfectly worthless, except for exhibition, and only made for the occasion; that the second-prize hive was made of mahogany with four glass sides. I should like to know what is the difference, they both being glass; mine being the shape of a common straw hive, the other a square box? I can only say it is made-up for the winter, and with plenty of food, and I dare vouch for having the first swarm from it, and I will let your readers know from time to time how it is going on. It would not do for us all to fancy one make of hive. Mr. Pettigrew is for the straw hive, some for the Woodbury, I for the Huber.

In 1872 we had rather a large meeting of bee-keepers at Mr. Pettigrew's, and should have had one in the past year, but as most of the Lancashire bee-keepers met at the show, it was thought advisable to let 1873 pass; but this year (all being well) we shall have a gathering to talk over matters and compare notes, either in Manchester or at Mr. Pettigrew's.—SOUTH LANCASHIRE BEE-KEEPER.

## BEE-FARMING.

THE 1st inst. was a beautiful day, so I thought I would examine my ten stocks, four in 18-inch and six in 16-inch straw hives. I found six in very fair condition both as to weight and bees, two very light, and two weak in bees. I was wondering how to proceed with feeding, for I have found that in cold weather bees will not take food from the top, and to feed underneath causes great loss owing to the bees getting chilled; but on the arrival of the Journal I saw just the information I required in Mr. Pettigrew's letter. I boiled some sugar, and placed some warm syrup in a top-feeder on one of my weak hives in the greenhouse, and the bees commenced taking it readily in a few minutes.

On Friday, the 2nd inst., when passing a friend's house about a mile from here, I inquired how their bees were going on, and was informed that about a fortnight ago a pig had found its way into the garden and turned one hive over, and had broken some of the combs. I examined it, and found that about half of the combs were broken, and had been taken out; it was very light, I should say there was not more than 1 or 1½ lb. of honey in it, with perhaps about a quart measureful of bees. There was no probability of its doing any good without feeding freely, and even with that would have been very likely to have been filled with drone comb in the spring, and perhaps have had too many eaters and too few workers; so they would not be at any trouble with it, stating I might have it if I could do anything with the bees.

As I had two hives very weak in bees, I thought I would try to unite them with one, but was afraid of the cold; however, I sent for them on Saturday afternoon, and while it was snowing and hailing outside, I was driving and uniting in the greenhouse by candlelight, which were successfully accomplished without much fighting, although the queen was not sought for, not more than a dozen bees lost—just a few flying out attracted by the light of the candle while inverting the hive.—T. BAGSHAW, Longnor, Buxton.

## THE ART OF SUPERING.

HAVING been an attentive reader of "our Journal" for nearly twenty years, I must own to have cut open the pages of your issue of November 13th, and laid it down for the first time with a feeling akin to pain. Does exhibiting tend to demoralise the exhibitor? It would even seem so. My eye rested first on the communication of a floral judge, noting the pitiful fact that the

very queen of flowers he found decked out like the jay, "in borrowed plumage;" so very extensively, too, that he and a brother judge were helpless to disqualify; further on, amongst the lovers of the feathered tribes, that Canaries are now produced in bright colours like a fast print, "warranted to wash." The artificial colouring being an internal process, cannot of course be expected either to breed or moult true—produced, in short, to show and sell. To escape such disagreeables I took refuge as a last resort in our own especial corner. What there met my view but an article from the pen of your valued contributor Mr. Pettigrew on the art of supering, containing the humiliating confession that the much-vaunted supers of the late horticultural exhibition were simply after all artificial, of Manchester manufacture, produced by feeding.

The honey display at Manchester after a season the worst in the experience of most bee-keepers, at least with us in the north, caused a general feeling of distrust to get abroad that there was something mysterious about these productions; but to the present writer the name of Mr. Pettigrew, who projected and collected the necessary funds to carry out the praiseworthy idea was a sufficient guarantee that everything would be conducted fairly and aboveboard, the more so as in a proposed competitive test of various hives he suggested in the spring, bee-keepers were to be excluded from all interference with their colonies, so that there might not be practised any "clever trickery," as he termed it; and I remembered, too, his burst of honest indignation the other year at some Stewarton supers, which had found their way to his city, and in his opinion were got up by feeding with sugar syrup, while another contributor as stoutly maintained the aforesaid supers contained no more sugar than did his pen.

The inquiry naturally enough arises, Was the art of supering pursued at Manchester by feeding a fair and legitimate competition? Most of your readers will agree in thinking with me it was not, no doubt; although Mr. Pettigrew tells us some of the supers exhibited were got up with sugar syrup, and consequently excluded, he fed with pure honey, the surplus of his stocks driven the twenty-fourth day after swarming. In such a season as last this was clearly what had remained over of former seasons, and consequently was *not*, as the rule demanded, "the produce of 1873." Supposing the same mode to be adopted next season, the surplus would be more or less the left-over sugar syrup of the fall of 1873. I cannot agree with your correspondent that "any honey tainted by farina or other impurity" can be given to bees with impunity to store in supers. The grosser impurities will doubtless be left behind, but the taint will remain.

Mr. Pettigrew presupposes that when the "art" of artificially filling-up supers becomes generally known, the production as well as the demand must be materially enhanced. I am afraid the opposite of this will hold good. Honeycomb in supers has generally realised about double the price per pound of run honey, because the wealthier classes assumed in purchasing it in this form they procured at the enhanced price pure virgin honey in contradistinction to the impure stuff, possibly adulterated with brown sugar, which is too often palmed-off as run honey. But let it once go forth that supers are no longer the pure nectar of the flower of the current season's gleaming, but mere "works of art," dependent for their composition on the conscientiousness of the respective artists, and they will speedily become but fancy ornaments to decorate their dwellings or the honey ware-house.

The most reprehensible part of the exhibition was the unexplained artificial nature of the contents of the supers exhibited at Manchester. The crowds of spectators were permitted to examine and move away under the false impression that they were *boni-fide* productions, due to some particular hive and system superior to what they already possessed, and the extreme badness of the season caused the disparity to appear all the greater. Mr. Pettigrew excuses himself thus: "The International could not wait for a favourable honey year, hence I had to resort to artificial means to get my palaces filled." One beautifully sealed bar of fresh pure honeycomb would be of more value in the eyes of the straightforward honest bee-keeper than any so-styled crystal palace of the Manchester Exhibition. To the practical apiarian are such crystal palaces reckoned works of high art? I trow not. They could, if thought advisable, be produced easily of an enhanced size to the "Try to beat this" of Manchester manufacture; the whole thing involving merely the possession of a few swarms of bees and a cask of the cheapest foreign honey—according to Mr. Pettigrew it mattered not how much fermented, tainted, or filled with impurities, it would all be purified in the slinging process; but most people would suppose refined sugar the more wholesome of the two.

To illustrate that such manufacturing is not altogether a new Manchester idea, I chanced some years ago to make the acquaintance of a town resident who knew absolutely nothing about bee-keeping. He had a friend, however, to whom he was indebted for some very beautiful glasses of honeycomb. The season I first met him his friend had secured not one but many palaces of various sizes; a couple ran to about Manchester weight.

From the description of his situation—the centre of a wide heath district, and knowing something of the results obtainable by combining prime swarms, I never for a moment dreamed but that all were genuine. My acquaintance told me he was going to take a run through to visit the bee-master, and promised to bring some particulars on his return of points of manipulation respecting which I wished for information. He was as good as his word, giving a graphic description of the enthusiasm of his friend upon bees, how he intended getting-up a glass for presentation to Her Majesty of a size that the largest I had seen would be nothing to, how he could easily fill a glass case as large in size as the railway carriage in which they were then travelling, how it would be a good thing to bring out one glass flavoured with citron, another lemon, &c. I brought him up rather abruptly, telling him I feared his bee friend was but a manufacturer, and dropped the acquaintanceship, at the same time pitying the one who had invested a considerable sum in the purchase of the largest palace.

The best proof that the Ayrshire bee-keepers are not, as a body, guilty of palming-off sugar syrup for flower honey, as insinuated by Mr. Pettigrew, is their accustomed octagons are nowhere to be seen the present season, when the price and the scarcity would make the temptation all the greater. Their glass merchants are not like the International, they are forced to "wait for a favourable honey year." The following colloquy passed between, I believe, the largest bee-keeper in Ayrshire and his merchant. On making his appearance the first question asked was, "What has become of your honey?" His reply, "My bees have gathered no flower honey this season, I have none to bring, and cannot make it."

At every exhibition, of whatever description, there ought always to be a lynx-eyed committee of investigation, who would go round disqualifying, if need were, before the judges began their duties, which are onerous enough without being called upon to act as detectives. Were it once known such a system was rigidly enforced no "unpleasantness" would follow, and frauds and chicanery disappear. Our southern friends should take the example set them by the Directors of the Ayrshire Agricultural Society some years ago. An "outsider" brought a bull which successfully competed in the open division, carrying off first honours, and was at once sold at a long price. His head was ornamented with a particularly stylish pair of horns, which were very much admired. Some inquisitive individual put back the hair at the roots, and made the discovery that the horns were false, stuck on with gutta percha. On this being communicated to the Directors the exhibitor was summoned before them, when they intimated that his prize was forfeited and his name for ever expunged from the list of members. The Fiscal, on behalf of the criminal authorities, then took the matter up, and he was tried at the next assizes for fraud and wilful imposition, fines refused, and condemned to an imprisonment of many months. The horns of the bull were real horns from another animal. The foliage of the rose blooms were real too, borrowed from another bush. The honey was also real, borrowed from other hives. The deceived purchaser of the bull could never expect him to reproduce the same horn, or the buyers of the rose the same foliage; those of the Canary the same golden tint; nor yet the Pettigrew hive the same amount of honey during a similar season, all ranking alike in the category of the false and deceptive.—A REXFREWSHIRE BEE-KEEPER.

## FOOD FOR BEES.

ACCORDING to Dr. Edwin Lankester fresh cow's milk contains 86.0 per cent. of water and 4.5 of sugar and, of course, skim milk has a greater percentage of water and less of the heat-producing materials which form the cream taken off by the process of skimming. I maintain, therefore, that skim milk, as it contains a small portion of nutriment and transforms the sugar liquid into honey colour, is much preferable in preparing bee food than merely water "pure and simple." Mere thin sugar toffy, I think, is deficient in the consistence, the strength, the mealiness, the farina of honey, and to correct this defect I add oatmeal, which is the best and strongest of meal, and I find, as I stated in my first note, that the bees clear it away with quite as much dispatch.—A. T. W., *Kidwelly*.

[We have omitted some paragraphs. There is no "farina" of any kind in honey, whether you mean by that term the pollen of a flower's anthers, or meal, which is the synonym of "farinaceous matter." The most successful bee-keepers we have known feed only on a syrup of the consistency of honey, made of sugar, water, and a very slight addition of salt. That bees seek for saline matters is well known by those who have watched them alighting on pebbles by the seashore and the puddles in stable-yards.—EDS.]

PIGEON NOMENCLATURE.—In reply to your correspondent "TURKEY QUILL," it will, I think, be sufficient to state that, so far as I can understand his meaning, I described the Silver

Dun Carrier at Glasgow precisely as he himself would have done.—YOUR REPORTER.

ORANGES FROM ST. MICHAEL'S.—The British Consul at St. Michael's has sent to the Foreign Office, in a recent report, an account of the value of the fruit trade of that island with Great Britain, year by year, from the year 1747, when it commenced, down to 1872. The first export of oranges thence to this country is recorded in 1751, when 3½ boxes at 900 reis per box, amounting in all to little more than 3 milreis, were sent. The trade grew and multiplied; and 120 years afterwards, in 1871, the export comprised 264,925 boxes, at 1610 reis per box, or 426,932 milreis in all. In 1872, the Consul's returns show that there were 256,451 boxes of oranges exported from St. Michael's; their value was £80,705, and the export duty produced £599. Pine-apples and bananas are also cultivated. Our own Custom-house returns state that in 1872 we received from the Azores oranges and lemons of the value of £329,342. But though Great Britain absorbs almost the whole of the foreign trade of the Azores and imposes no duty upon the import of their fruit, these islands treat us with scant courtesy, for France and Prussia are allowed an invidious exception in favour of their merchandise, and an additional *ad valorem* duty is imposed upon British wares exclusively. Owing to this heavy duty French goods, which are favoured, are to be purchased at lower rates. The Consul has to state that tourists should be advised to visit St. Michael's in July and August only. The climate has been described as offering a nine-months rainy spring, and as a winter station St. Michael's is, as compared with Madeira, deficient in the comforts of life, and has not an enviable climate.—(*Times*.)

### OUR LETTER BOX.

BOOKS (J. E.).—Taylor's "Bee-keeper's Manual," published by Groombridge & Sons.

MILMO AND BROUGHTON SHOW (Q.).—It must have been a local Show, not being advertised.

NORTHERN COLUMBIAN SOCIETY (W. C.).—It was not advertised so we conclude it was a local Show.

DUMFRIES SHOW (—).—It was not advertised, so we conclude it was intended to be local.

LEEDS POULTRY SHOW.—Mr. J. Mason informs us, that in the class for old Black Red Game he obtained the first prize.

LEWES POULTRY SHOW.—Mrs. G. Meek should have been credited with the second prize for Dorking hens. As the Dorking, Dark Brahma, French, and Any variety classes were exceedingly good, those exhibitors whose specimens were very highly commended will receive an extra prize—viz., Viscount Turnour, Mrs. Brassey, Mrs. J. G. Hopburn, The Rev. T. Cochrane, Mr. H. W. Reville, Mr. J. Walton, Mr. G. W. Hubbert, Miss P. L. Hencowe, Mr. A. Wood.

BROMLEY POULTRY SHOW (W. H.).—We agree with "AN EXHIBITOR," that the names of the Committee should be published. All your suspicions are unfounded.

BRAHMA VULTURE-HOOKED (O. A.).—Judges consider vulture hooks objectionable, we do not know why, but not a disqualification. The "Poultry Chronicle" was long since incorporated with this Journal.

POULTRY-KEEPING (J. Woodall).—If you enclose seven postage stamps with your address and order "Poultry-keeping for the Many," it will be sent to you post free, and it contains all the information you mention.

PACKING EGGS FOR TRAVELLING (W. D.).—Eggs should always be packed in dry moss, as it is not affected by soaking, and the eggs do not then move from the position in which they are packed. Almost any other material moves from the shaking consequent on travelling, and often leaves a layer of eggs, bare of any protecting substance. A basket, flower-pot shaped, with a lid, we believe to be the best form of package.

BREEDING IN-AND-IN (J. H. E.).—Brothers and sisters are worse mating than parent and offspring. The yearly change is only a positive necessity when something more than eggs and table poultry are wanted. You may breed two years from the same birds, using the same cock, and eating or selling the young ones. If, however, you should breed one or two of surpassing merit, you might do away with the old bird, and run the young one with the hens. We repeat, these nice points want only to be observed where exhibition and perfect birds are wanted.

COCK-CROWING ANNOYANCE (G. M. F.).—We know no breed of non-crowing cocks, and it is the habit of bright Chanticleer to proclaim the day, which now, we are thankful to say, gets earlier weekly. Many expedients, such as straps round the throat, have been tried, but all were failures. We do not think your neighbour can compel you to put away your crowing cock. Magistrates differ, and so do their decisions. The majority decide that cock-crowing is not a nuisance, especially when only one is kept. We give this opinion under correction, and with diffidence, believing with our old friend Sir Roger de Coverley, "Much may be said on both sides of the question." There is, however, one way of doing away with early crowing, and that is to confine the cock in a dark place. Come to an understanding as to an hour when the crowing shall cease to be a nuisance, and till then confine the bird. He may be put in a hamper, large basket, or box. He must be in the dark in a dry place, free from draught, till his hour of release, and need not suffer in condition from it.

DUCKS (A. T. W.).—The only profitable Ducks in the Variety class are Mandarins and Carolinas. They breed freely, and their produce is always saleable. The Whistling Ducks do not breed as freely, and are not so popular.

BANTAMS WITH CRIVE-OURS (J. H. E.).—You may keep Black Bantams and Crive-ours together safely. We have done it for years, and it is our opinion it may always be done, especially where all are of the same colour.

THIN-SHELLED EGGS (Alpha).—Have a heap of coal ashes and bricklayers'

lime rubbish mixed together under shelter, where the fowls can bask and obtain more chalky ingredients.

DESTROYING BEES (*Ignoramus*).—Cottagers usually suffocate bees when taking their honey, but it is a barbarous and unprofitable custom. Good bee-keepers use hives which enable them to take part of the combs, and yet leave a sufficient store for the bees. You can have a book, "Bee-keeping for the Many," if you enclose five postage stamps with your full address; that will instruct you.

BEES DYING (*James Gregg*).—The comb you have sent for inspection has doubtless been taken from a damp hive, or from one standing in a damp place or on a wet board, otherwise it would not have been so mouldy. The contents of the cells were covered with mould, and like puddle. It is impossible to state with certainty what has been the cause of the death of all the bees in one of your hives, and how those in another have been so greatly reduced in number. The cause may have been one or more of the following:—Foul brood, the loss of queens, their failing to meet drones at the proper time, or want of food. If, as you think, foul brood is in your other hives, they will not thrive. The bees should at once be placed among sweet combs. The comb which we noticed above has no diseased or foul brood in it.

SKELETONISING LEAVES (J. E. K., Baltimore).—We believe Mr. Kaye is a respectable man. Perhaps his book is out of print. We wish that some one at Dewsbury would bring this reply to his notice.

### REMARKS.

Dec. 31st.—Rain in the morning, fine at noon, but dull after.  
Jan. 1st.—Foggy early, but fine at noon; rather dull after, though fine at night.

2nd.—Windy night, rainy morning, and at intervals all day, but fine at night 3rd.—Rainy at intervals all day, though bright at times.

4th.—Very bright occasionally, and, with the exception of a few flakes of snow at 3.30 P.M., fair all day, but much colder.

5th.—A very slight covering of snow in the morning. A beautiful winter's day: bright though cold.

6th.—Rather foggy and frosty early, but a beautiful day.  
Mean temperature of the week much the same as last, caused by the warmth of the earlier part overbalancing the increased cold of the last few days, which may be said to have been the first fine winter days that we have had.

The total rainfall of 1873 here was 22.67, being nearly 2 inches (or about 10 per cent.) below the average.—G. J. SYMONS.

### COVENT GARDEN MARKET.—JANUARY 7.

A VERY fair supply is well kept up, both out-door produce and that from under glass being sufficient; indeed, there is a most unusual supply of Grapes in the market, comprising retarded Hamburgs, Alicante, Gros Guillaume, Lady Downes's, and Muscat of Alexandria. Our home Pine-growers will now meet with a most formidable competition from those in St. Michael's, who are sending a splendid lot of Cayennes, completely putting the others in the shade for size, appearance, and quality, and which are sold at very moderate rates. Potatoes are a heavy trade, and large quantities at the depôts.

21	W		42.9	32.0	37.5	23	56 7	27 4	59 9	43 8	3	11 38	21

From observations taken near London during forty-three years, the average day temperature of the week is 42.5°; and its night temperature 30.4°. The greatest heat was 68° on the 19th, 1828; and the lowest cold 4½° below zero, on the 19th, 1838. The greatest fall of rain was 0.88 inch.

## LATE-KEEPING GRAPES.

HERE is no department of fruit-culture in which there is a greater diversity of opinion than as regards the merits of late-keeping Grapes; nor is this diversity confined to the later introductions, but it embraces all kinds, with the exception, perhaps, of Lady Downe's, which certainly hangs in good condition longer than any other sort, and invariably yields an abundant crop of fine high-coloured fruit. Culture and manage-

ment must, of course, always exercise an influence upon the Vine and its produce, and there can be no doubt that some really valuable sorts have been hastily condemned from ignorance of their particular requirements. It would, therefore, I think, be to the mutual advantage of the raiser of a good Grape, and the public to whom he offers it for sale, if any peculiarities either in the Grape or its culture were clearly set forth in the first instance.

In discussing this subject, and in a comparison of results, a liberal margin should be allowed for the influences of soil and situation, the vigour of the Vines, and the kind of structure in which they are planted, it being quite obvious that a weak point in either respect may lead to total failure. Given a light airy vinery, with a suitable apparatus for the production of artificial heat, a thorough yet graduated ventilation, and a sound well-made border, other things being equal, success in the fullest measure usually crowns the efforts of skilful culture and management.

The Grapes which I am now sending to table are from Vines that have had the benefit of most of these advantages, and yet the measure of success is hardly so full as could be wished, owing to the imperfect development of one or two new kinds. The Vines are planted in a narrow interior border of about a yard wide, the roots spreading thence under wide arches in the front wall into an extensive outer border. I have described the formation of this border in a former paper, and to show that the Vines are in a flourishing condition I may state that stout canes of about 25 feet long were produced almost without exception in the first or planting season; and this is not advanced as an extraordinary instance of vigour, but rather as an example of what growth may reasonably be expected from any healthy young Vine. A few details of culture, although marked by no novelty of treatment, may yet prove useful to beginners.

TEMPERATURE.—The aim has been to keep up a steady equable temperature, 50° being the starting maximum, increasing slowly and gradually with the growth, so that when the bunches were in flower a night temperature of fully 75° was maintained. After the fruit was "set" this was reduced to about 70°, which was the standing temperature till the entire crop was ripe; since then artificial heat has only been required to disperse damp, or, rather, to maintain sufficient warmth in the pipes during damp weather to keep a dry atmosphere in the interior of the vinery.

As these Grapes were brought to maturity during the hot weather of the summer and early autumn months, solar heat exercised an important and most beneficial influence upon them, it being a standing rule that on all bright days every vinery containing an unripened crop of fruit shall be closed in the afternoon when the thermometer is at 90°; and when the sun is shining full and strong this high temperature often increases by 5° or 10° after the ventilators are closed. Under such favourable circumstances the heating apparatus becomes rather a valuable auxiliary than the principal source of heat, and its aid is not required till late in the evening.

VENTILATION.—Air in proportion to the condition of the weather was always admitted through the ventilators at the highest part of the roof as early as possible in the morning, except during the prevalence of cold cutting winds, and during the colouring of the fruit some of the external air was admitted night and day. After the crop was ripe, both front and back ventilators were opened fully and constantly till the damp dull weather set in, when it was reduced to an opening along the top of barely half an inch, just enough, in fact, to keep up circulation.

WATERING.—Water played an important part throughout the season of growth, the syringe being kept in frequent play till the flowers began to expand; the evaporating trays were kept well filled, water was constantly thrown about the floor, and tons of it and weak liquid manure were poured upon the inner border, the main drain sending out such a flow after each application as would very likely startle anyone having a heavy soil or badly-constructed border to deal with. Some caution is certainly advisable in this latter operation, and I would advise care and moderation to those having to contend with the evils of a faulty border. This liberal use of water was continued up to the time of flowering, and again afterwards till the colouring was well advanced. The syringe was not used after the Grapes were visible, yet I failed to discover the slightest trace of red spider throughout the season. When the bunches were in flower they were examined twice daily, and the pollen applied with a brush whenever it appeared necessary; generally, however, pollen was so abundant that a sharp rap upon the trellis would cause the tiny capsules to fall by thousands.

The varieties grown were—

*Barbarossa* [Gros Guillaume].—The bunches of this kind were so numerous that more than half had to be taken off. They were almost all of the large size that is so characteristic of the fruit of this Vine. Some extra fires were required to fully ripen them, but the fine, rich, crackling, and very juicy fruit, and the noble appearance of the bunches when cut, afforded ample compensation. This Grape should rank very high upon the list of standard sorts. It is true enough that it requires a high temperature to develop its full rich flavour, but it is equally true that it is eminently worthy of it; for, as Mr. Pearson states in his little work on the Vine, it is, with proper treatment, "one of the very best black Grapes grown."

*Black Alicante*.—This is an especial favourite with me. It is a magnificent Grape. The bunches are large, with wonderful shoulders, and very large berries of a fine deep colour, and splendid bloom. It produces fruit abundantly, and is decidedly one of the best late Grapes.

*Lady Downe's*.—This useful Grape has been quite equal in colour and size of berry to Alicante, but its bunches were not nearly so large.

*Madresfield Court Muscat* had large, well-shouldered, tapering bunches, with large, rich, and juicy berries of a most delicious flavour. It produced its fruit abundantly, and is altogether a fine and most desirable variety; but it did not keep well; there was an evident loss of flavour perceptible soon after it was fully ripe, and the berries soon began to shrivel. From my present experience of it I should certainly in future assign it a place in an intermediate house.

*Mrs. Pince's Black Muscat*.—This has quite disappointed me. It is very vigorous, very free-bearing, sets its fruit well; the bunches were large, well-shouldered, and symmetrical, and it hangs well; but the berries were small, deficient in flavour, and very badly coloured. Yet I do not wish altogether to condemn it, for I have seen it in much better condition in other hands, and am not without hope of future success.—EDWARD LUCKHURST.

### JUDGING ROSES.

MR. CAMM seeks to elicit the opinions of Rose-amateurs on the subject of judging Roses at shows; and if I interpret his meaning rightly, he wishes not only the particular points he has named to be fairly discussed, but also that the whole question should be considered, with a view of laying down, if possible, some general principles in accordance with which the judging should be performed, so that a common understanding may be arrived at on the main points that determine the award of prizes.

The judging of Roses, like the judging of other subjects in horticulture, has always been a vexed question—probably always will be, not so much from the difficulty or impossibility of pleasing everybody, which it is not worth while to attempt, as from a cause which Mr. Camm has himself illustrated—namely, those ordinarily regarded as authorities in the matter hold opinions widely diverging from one another, and from whom, therefore, uniformity of decision can scarcely be expected at all times.

But there are points on which judges of Roses at shows can agree, or rather on which they must agree if they perform their duties conscientiously—a postulate not requisite to be brought forward in this discussion; and these points are so obvious that it is quite sufficient if they are stated briefly but clearly. This I will endeavour to do before taking up Mr. Camm's two questions. At every show of any pretensions at all, the judges are provided with a copy of the schedule of prizes to be awarded to the several classes or groups, as the case may be, and with such regulations as specially refer to these classes, at least so far as their duties are concerned. In all properly regulated shows the stands of the exhibitors are, or should be, arranged in their various classes and groups in good time, and in positions favourable for inspection both by the judges and by the visitors admitted afterwards—matters of paramount importance to all concerned; for if the flowers are staged late the judges have either to hurry through their duties in a manner anything but satisfactory to themselves, in order to complete the awards before the admission of visitors, or, if visitors are admitted before the judging is finished, the inconvenience is sometimes so great as materially to impede progress. The judges should always have time allowed them, a little over rather than under the assigned hours, for when the competition is keen and the number of exhibitors great, their duties are not only onerous, but many minor points have to be carefully considered and comparative merits evenly weighed. I remember an occasion when acting as one of the censors, that owing to close competition among a considerable number of exhibitors, the visitors were admitted before the judging was complete, and we received all sorts of unsolicited suggestions upon the merits of the specimens to be decided. Perhaps the hints came from the exhibitors themselves; we could not tell, only we were made aware that our decisions did not all quite coincide with the opinions of some of our self-constituted advisers.

Let us assume, however, that all arrangements are complete by the appointed hour, and that ample time is allowed for the

judges to perform their task, and the services of a competent and sufficient staff secured; there are, I repeat, certain points on which they must agree, whatever may be their individual opinions on minor matters, whatever theories they may have formed as to what ought to be, or whatever "*penchant*" they may have for this or that variety or class of Rose. They must first disqualify any stand that does not fulfil the requirements of the schedule and accompanying regulations. For example, if twenty-four different kinds are required, they must see that there are not two or more of one kind in the same collection, or that two or more of one kind are not staged with different names, for these accidents have sometimes occurred from inadvertency. A most excellent stand was once disqualified with much regret on the part of the judges because it contained two blooms of one variety, but which was known to be an oversight of the exhibitor. It is also the duty of the judges to see that the specimens are correctly named—a requirement generally stated in the regulation, and almost always assumed if not stated; but it certainly is not the duty of the judges to name the exhibitors' flowers for them. It is a controverted point whether misnomers should disqualify; the question is not without difficulty, owing chiefly to the enormous number of Roses with different names that have been introduced into cultivation, and which has, almost as a natural consequence, led to occasional mistakes, and which are therefore the more pardonable. If one or more, but not many, misnamed specimens occur in a stand of good flowers of the requisite number of kinds, it would evidently be an undue exercise of severity or even harshness to disqualify on that one account. Leniency in this respect ought to be, and I believe is observed by the best judges; at least no serious detriment to the principles on which the show is established can arise from a judicious exercise of it.

As a matter of course the stand containing the greatest number of perfect and best grown blooms must have the first prize in its class, and the next in number and quality the second, and so on if more are to be awarded. It is when the competition is severe that such points as Mr. Camm has mooted arise for consideration. Let us again assume as our instance that the class to be judged is twenty-four blooms of any kinds, distinct, one truss of each. It is quite clear that if thus stated in the schedule, or to the same import, the exhibitor may, if he chooses, select his flowers from any family or class of Roses. Whatever varieties are shown, the judges must decide according to the actual condition of the flowers submitted to them; however fine some of them may be, if past their culmination (if I may use the term) they cannot assign to such a consideration equal to what they would do if these flowers were in their prime—in other words, their exhibition value is deteriorated. Similarly of flowers exhibited before they have attained their perfection; judges are not to suppose what they would be if left on the plant they were cut from for another day or two. Nor can any account be taken of very small blooms however perfect they may be in form or colour; these may be admirably suited for a button-hole, and as such might form a class by themselves for the gratification of those who delight in decorating themselves with floral ornament. Exhibitors frequently fall into the mistake of cutting their flowers overblown, or too soon before expansion, under the impression that judges will give them the same or nearly the same amount of credit as they would do if they were at their best.

If the competition, say, for the first prize is so close as to require a comparison of the merits of the individual flowers in the competing stands, the judges ought in fairness to the exhibitors to take into consideration every circumstance for and against; form, size, and colour predominating. But these are not all: they must know that Tea-scented kinds engross a much larger degree of attention on the part of the cultivator than any other family of Roses, and that among them are found variety in form, colour, and beauty not yet attained in other kinds; so that to leave out the consideration of these qualities would be to throw indirectly discouragement in the way of their culture. I therefore agree with Mr. Camm very decidedly that the insertion of two, three, or even four well-grown trusses of Tea-scented kinds in a stand of twenty-four does materially improve it. Where can we yet find a finer yellow than in *Maréchal Niel*; a more beautiful bluish pink than in *Souvenir d'un Ami*; a more pure white, with delicate centre, than in *Devoniensis*? Nor must our old but somewhat capricious favourite *Gloire de Dijon* be forgotten. Not only these but others of the same race can be grown quite large

enough for exhibition. But that a Tea Rose, even in the highest perfection, should have a double exhibition value assigned to it, or, as Mr. Camm says, two points to the others' one, would be to give a sort of mathematical precision to Rose-judging which it is not susceptible of. The science of judging Roses has not yet become a deductive science; it is still an empiricism, and it will be some time before absolute certainty is arrived at in all its aspects.

It is quite consistent with fairness that the judges should not pass unnoticed the arrangement and symmetry of the whole stand, comparing such with its competitors; but in my opinion distribution of colour should have precedence over uniformity of size. Artistic taste is not always satisfied with seeing the most charming of flowers set-up like a squad of volunteers at drill. I am one of a very few, perhaps, entirely at issue with the present mode of exhibiting Roses, but to enter upon this question now would be too great a digression.

I wish to add one remark on size. Granted, however, that large Roses are desirable, they are always admired and sometimes wondered at; but it should be remembered that there are yet very few varieties naturally large with all the perfection of Charles Lefebvre, Baroness de Rothschild, Maréchal Niel, and Marquis de Castellane. There are undoubtedly many large Roses in cultivation, and even monstrosities, but most of them are either flat, unsymmetrical, coarse in petal, deficient in colour, or otherwise objectionable; while there is a multitude of others of surpassing excellence, which, though not naturally so large as the kinds named above, nevertheless form the body of every Rose exhibition. To set-up a fictitious standard of size, thereby inciting amateurs and exhibitors to aim at producing abnormal flowers, to overstimulate and kill their plants, inducing hypertrophy and a moiety of the plagues of Egypt among them, cannot tend to a healthy promotion of Rose culture.—A. H. KERR.

### WINTER-DRESS YOUR FRUIT TREES.

This is no advertisement. I have nothing to sell. I merely wish to point out what a vast deal of time, anxiety, and perhaps fruit (if the midsummer frosts do not come again) can be saved by timely attention to the trees in winter. I suppose no good gardener now believes in late pruning; all should be finished at the first opportunity after the principal leaves have fallen, and most of it ought to be done before that time. The worst time is undoubtedly just when the buds are swelling.

As soon as the pruning is finished no time should be lost in taking care of the fruit buds that remain. Bullfinches I see are getting more numerous than ever; they will soon make an onslaught on the Cherries and Plums if left to themselves. Eggs of aphides may be seen clustered round the buds of Peach and other trees in the most sheltered positions; and red spider, if not seen now, will soon make its appearance when the trees begin to grow. Now is the time to battle against all these enemies with a chance of victory. Leave it till the spring when the buds are beginning to swell, if the bullfinches have left any, and probably you may not get rid of your small tormentors all the summer, certainly not till your trees are damaged more or less. The insects will seem to be in the buds as they open, and will grow faster than the buds; the young leaves will be crippled and curled, and form a comfortable home from which you can scarcely dislodge them without removing or damaging some of the leaves, and the consequence will be that the best part of the spring will be past before you get a healthy shoot. If after that your wood ripens in autumn, you are fortunate.

There are many mixtures recommended for dressing fruit trees, some of which kill the insects, some kill the trees, and others kill both if used as directed by the vendors. The following is the best I have tried; it can be made by anyone, is quite harmless, and as far as my experience goes, birds will not touch it. The ingredients are a quarter-peck or more of quite fresh quicklime, a pint of sulphur, and 1½ lb. soft soap. Choose lime that weighs very lightly, dip a few of the lumps in or sprinkle with water (hot water is the quickest in action), and place in a bucket or other vessel; sprinkle a little of the sulphur thinly over it, then add more lime just damp enough to slack, and more sulphur on the top of it, repeating this till all the sulphur is used. When the lime is slacked it will be seen that the sulphur is quite dissolved, and is scarcely visible, except in the darker colour it has given to the lime. The quantity of lime used is not important, so long as there is

sufficient to dissolve the sulphur. The soft soap should be dissolved separately, and afterwards mixed with the lime and sulphur, and sufficient water added to make three gallons in all. If the mixture is not thick enough to apply with a brush, clay or more lime may be added; if the glaring white is objected to, mix soot with it. If mixed in the way I have described and applied in dry weather, no amount of rain will wash it off; but if lime is used that has been some time exposed to the air, the sulphur will not properly dissolve, and the first shower will wash all away.

It is necessary to caution my readers against dissolving the sulphur in a house containing plants in a growing state, the gas emitted will burn up every leaf just as completely as if fire had been used. I have, however, never found trees injured from being painted with this mixture; it is only the sulphurous gas that is dangerous, and that, probably, would not injure plants in a dormant state.—W. TAYLOR.

### THE KITCHEN GARDEN.—No. 4.

In this paper I purpose making a few remarks upon the extent of kitchen-garden ground likely to be required among those for whom I write. There may be a difficulty in laying down a rule for one and all, but I doubt not that I shall be able to say sufficient to afford some guide to those who may require a few hints.

One of the first considerations is the number of persons to be supplied from the garden, and next is the style of living, which varies considerably according to the company entertained and parties given. There is a great difference, too, in individuals as regards the consumption of vegetables, for while some families require a large quantity others consume comparatively little. Of fruits of different kinds I believe the consumption is more equal, for there are few, if any, who do not like to have all the fruit that can be grown in gardens such as I am writing about, especially of Gooseberries, Currants, Raspberries, &c. Again, some persons have a fancy for particular vegetables, Asparagus or Sea-kale for instance; and if forced supplies of these are required from Christmas onwards, much more space will be needed for their cultivation than if they were only to be used at their natural season. In fact the vegetable luxuries indulged in, and the length of time during which they are required, will be some guide to the extent of ground needed for their growth. One or two other things must be taken into consideration. For instance, some soils are not so fertile as others, and will not produce the same quantity on a given space or of such good quality; this, however, I do not think a very great difficulty, as soils can be much improved and made more productive by a judicious system of cultivation.

Before settling upon the extent of the garden proper it should be ascertained whether the coarsest of the vegetables, as the main crops of Potatoes, Carrots, Parsnips, and the like, are to be grown in an outside slip of ground or in a field; many proprietors of small gardens either do that or purchase such supplies, so that this makes a material difference in the size of the garden to be formed. I am no advocate for enclosing more ground than is required, rather would I err the other way, for it is a question in many places when such is the case whether, under good management, a smaller garden would not supply everything required, and a large garden not fully cropped looks anything but well; besides, it offers an inducement to crop the spare ground with something that may prejudicially affect its fertility. For instance, I have known more than one garden where the vacant ground has been planted with forest trees, such as Chestnuts, Ash, Beech, and Oak, and almost every particle of nutriment taken out of it. When this ground is again wanted for vegetables they are found not to thrive satisfactorily, the mistake is discovered, and much time and expense incurred in restoring fertility.

Mr. C. McIntosh, when writing on the subject years ago, states that to every four grown-up persons a rood of ground should be allotted, and so far as my experience goes I have no reason to doubt his estimate; therefore a garden enclosing an acre of ground may be set-up as one of very fair size for an amateur. Of course the extent may be less or greater as circumstances dictate, but I am not calculating that all gentlemen would wish to indulge in every garden luxury provided in families of rank; but in an acre of ground one might have his little greenhouse and vinery, a small pit and frames, and if Potatoes and some other common vegetables are provided elsewhere, there will be employment for one active man constantly, with perhaps

an assistant at busy times. It is difficult, however, to give a correct estimate of the labour required for a garden, for where one man will be sufficient in some gardens of an acre, others of that size will need two or three, so much depends upon the arrangement and convenience of obtaining everything connected with a garden. As an instance I will suppose that there are two gardens of one size—one shall have the water laid-on to every part and the other shall not. Imagine the extraordinary difference in the labour attached to it, and in dry summers a man's time might be wholly taken up in watering his crops to the neglect of other things. In my opinion this is the only way to judge of the amount of assistance required whether in a large or small garden.—THOMAS RECORD.

### TEA ROSES.

THERE has been of late quite a commotion respecting Tea Roses, and I am very glad to see it, as there is always some good derived from discussion. With regard to Tea Roses in exhibition stands, I am firmly of opinion that one of these is not complete without the Teas. Where can you get those fine tints in the Hybrid Perpetuals as in the Teas, which are delicate in colour, fine in texture, and very large if well grown? Where can you find a Hybrid Perpetual equal in colour to *Devoniensis*, with its beautiful waxlike petals, so chaste and striking in appearance? Then take *Madame Bravy*, a charming Rose, very large and almost perfect in form, its colour a beautiful cream, blending splendidly with the lines of the Hybrid Perpetuals. Then we have *Souvenir d'un Ami*, *Souvenir de Elise Vardon*, *Catherine Mermet*, and *Belle Lyon-naise*, all of the first order for size, substance, and delicacy of colour. How can we discard them as not to be shown with the Hybrid Perpetuals when they harmonise so nicely with each other? I contend that if such be the case it would be a monstrous blunder. Fancy how monotonous a stand of Hybrid Perpetuals would look (although they might be fine blooms) especially if they were nearly of one colour, as they most probably might be, such as *Alfred Colomb*, *Marie Baumann*, *Léopold Hausburg*, *Sénateur Vaisse*, *Exposition de Brie*, &c. Stands of thirty-six, twenty-four, and twelve, without the introduction of Tea Roses, would be very dull, would want life; but combine the two families, then you will have variety, contrast, and distinctness of colour. I trust that the separation of Teas from Hybrid Perpetuals will never take place.—MABEL WHITTLE, *Belgrave*.

### THE ACHAN PEAR.

THIS well-known Scotch Pear, I believe, is held in high esteem, and seems to do remarkably well in Scotland, but is of little use as a dessert Pear on this side of the Tweed; indeed it is seldom met with in England. I was, therefore, somewhat surprised to find a tree of it here against a south wall, although we have so many varieties better deserving such a position. This, however, was accounted for by the fact that a Scotch gardener made this garden some sixty years since. When I took it in charge I found this and a few other trees much neglected. Not knowing what the tree might be, I commenced renovating it by reducing the old worn-out spurs that had formed an almost impenetrable mass about 18 inches from the wall, also a mass at the top, which, with some of the main branches, was displaced, and as much young wood laid-in during the following summer as could be done. By these means I have had for the last three or four years an immense crop of fine large fruit, but of course useless for the dessert, being dry, almost flavourless, and decaying as soon as ripe.

Pears being very scarce anything was better than none, and it occurred to me to send in fruit of this variety just before they came to maturity to be used for cooking, and for that purpose they are thoroughly appreciated by the family at table. I do not assert that they are equal to the *Catillac*, *Belmont*, or *Uvedale's St. Germain*, either in colour or flavour, but a little spice, cochineal, &c., will make a vast difference and produce an excellent sweetmeat. They are preserved in jars by the score, keep well for months, and are found of great use during the winter when other fruits are scarce.

I am rather glad that I did not carry out my idea of replacing the tree above referred to with a better variety. Indeed a young tree had been placed near it to take its place, for I like all young trees if possible to be almost in a bearing condition before planting them in such places, so that wall space may not be idle for at least four or five years.

I will just mention in favour of growing this variety—first, that it is a sure cropper, frosts doing but little damage to the blooms when it kills all others; second, that it is scarcely affected with canker, in proof of which there is the fact that it has stood here for sixty years, when trees of many other varieties have died.—J. TAYLOR, *Maesgynne*.

### FLOWERS FOR OUR BORDERS.—No. 24.

CAMPANULA CORONATA.—CROWNED CAMPANULA.

AMONG floral treasures the Campanulas hold a conspicuous place. Scarcely a country within the temperate zone which does not contribute several species to this very interesting genus. Their general appearance is well known, for the gardens are few indeed in which some Bellwort is not to be found. In so extensive a genus considerable differences of habit would

*Campanula coronata*.

naturally be looked for; and, accordingly, we find species varying from a few inches in length—as in the elegant little *C. pumila*—to several feet, as in the equally well-known *C. pyramidalis*. Some of them are trailers, of which class the *C. garganica*, often cultivated as a window plant, may be cited as an example; but far the greater portion of the species are of erect growth. A few are annual, and there are about twenty biennial species; but the genus consists chiefly of herbaceous perennials. White, and various shades of violet, blue, and purple, are the prevailing colours; there are, however, several yellow species, and also a few of a reddish blue, but none of a distinct red tint.

The present plant is a hardy perennial, growing about 3 feet high, and having foliage closely resembling that of the peach-leaved Campanula, *C. persicifolia*. The white calyx, with its green tips, has a very pretty effect, and we strongly recommend the species for general cultivation. It is of easy increase by seeds or division of the roots in spring.—(W. Thompson's *English Flower Garden*, Revised by the Author.)

A GARDENER'S SUPERSTITION.—On the first day of this month and year a cook needed Parsley to garnish some dishes of the breakfast-table; but the gardener, an old Lancashire

man, replied, "Wait awhile, cook, the lad's gone for a loaf." Cook saw no why in this because for delay, but the gardener was resolute; however, the basting-ladle and spade did not come into collision, for the loaf arrived, and then the gardener repeated the rhymed proverb:—

"Take out, then take in,  
Bad luck will begin;  
Take in, then take out,  
Good luck comes about."

#### NOTES FROM MY GARDEN, 1873.—No. 2.

Florist though I am, my first subject shall not be about florists' flowers, but one more generally interesting. There are multitudes of people who not only do not care for, but who positively (dreadful people!) ridicule the taste of a man who can go into raptures over a frame of Auriculas or find out the minute differences in a stand of Picotees; but there is hardly anyone insensible to the value of a good dish of "taters." I say hardly anyone, for I have known people who, so long as it was a Potato, were perfectly indifferent as to whether it was mealy or waxy, white or yellow, round or kidney. But they are the exceptions; happy individuals whom indigestion never disturbs. I, alas! am differently constituted, and think one of the first requisites for daily food is a good Potato, and, as I dare say some of the readers of our Journal will recollect, have not unfrequently bored them with discussions and notes on this very common subject. Most of the new kinds of Potatoes have been submitted to me for trial, while of all the old-established sorts I have had many years' experience. Of those that I tried in the past year I now proceed to tell.

What a strange and inexplicable mystery is that Potato disease! Strange that we should have been growing the Potato for three hundred years, and that not until 1846 should that terrible malady which brought desolation and despair to thousands of homes have made its appearance. Inexplicable too, for although it may be admitted that it is dependant on certain atmospheric influences, we may safely infer that these disturbing elements were no novelty, and that they existed before 1846 as well as since; and I know nothing that ought to teach scientific men a sharper lesson of humility than this, that with a matter which they can see, and feel, and test, and submit to microscopic investigation, they are, after nearly thirty years' knowledge of it, neither able to tell us the cause or suggest a remedy; and yet too many of this class are ready enough to decry as credulous those who believe in, although they cannot comprehend, the ways of Him "Whose footsteps are not known."

The past year has been one of strange experience also. I confined myself to comparatively few sorts, comprising Lee's Kidney, Myatt's Prolific Ashleaf, Waterloo Kidney, Lapstone Kidney, Paterson's Victoria, Sutton's Red-skin Flourball, Sutton's Hundredfold Fluke, Yorkshire Hero, and Dalmahoy. Of these the two former were planted in my garden, and the remainder in a piece of very light sandy soil just suitable for growing Potatoes. All came up well, but the late frosts in May sadly interfered with the produce of the earlier sorts. My plan is always to lay out the seed of the early sorts singly, so as to allow them to spear about an inch. This secures an even crop, and of course brings them forward more rapidly. Well, all these were lifted early. Lee's Kidney I found a very early Potato—as early as the old Ashleaf and very prolific, the tubers large and well-flavoured. I do not know its origin, but it was sent out by the Messrs. Lee, of Hammersmith, and is, as far as my experience goes, the best of the very early sorts. These were soon gone, for I had but few of them, and were succeeded by Myatt's Prolific. Of this the crop was fair, and not a symptom of disease amongst them. The greater portion of these I sent to market, for at that early time one can realise a good price for them, and they are not keepers. I found that my stock, though a selected one, was slightly deteriorating, and so I have this season determined to obtain fresh seed from a distance.

My later crops of Potatoes were all grown in the field, and nothing could have exceeded the healthiness of their appearance up to the very end of August; and as the first week of that month, which I have always regarded as the most fatal time (oh! how well do I remember that terrible week in 1846!) had passed over safely, I was led to hope that all would be well. But then came the September rains. Spots began to show themselves on the leaves, and on digging-up a hill or two unmistakeable proofs of the disease were noticed. Previous to this I had dug-out and eaten some rows of Dalmahoy's, a very

favourite Potato with many, and deservedly so; amongst these I had no disease, while, on the other hand, Waterloo Kidney, which I had hoped well of, was terribly touched. Lapstone, which I still maintain against all comers to be the very best Potato grown, was also tolerably free from the blight, although at other seasons I had found it easily affected. Yorkshire Hero I cannot, I am sorry to say, tell much about this season, for through some blunder it had got mixed up with another kidney, and therefore it must remain unnoticed. My mainstay was to have been Paterson's Victoria, for last year; in the same sort of ground, it turned out so well and kept so long that I entirely reversed my former unfavourable opinion of it. My crop this year was twice as good, the tubers splendid; but alas! when I dug them fully one-half were gone, and as usual, the largest finest tubers were those most hopelessly gone. I can well understand the pitiable look of despair with which the labouring man must regard his tainted crop on which he had built such hopes. There remained, then, but two sorts—Sutton's Hundredfold Fluke and Red-skin Flourball. Of these I had a few long rows each. They were grown alongside the Victorias, and although the latter were so diseased I did not dig-up half a dozen bad tubers of either of these two sorts, while both had heavy crops. Why this should be I know not, but I see my experience has been that of many others. As to the former, I regard it as a well-flavoured and mealy Potato, fit for general use. Sutton's Red-skin Flourball, I see, has had its admirers and detractors. My own experience is decidedly in its favour, but then it should be baked, and not boiled or steamed. No large Potato ought to be submitted to these processes of cooking.

Such, then, is my experience of Potatoes this season. I have suffered, as most have done, from the disease. I have not found any remedy. I endorse my friend Mr. Radclyffe's "early ripeners and long keepers" as the Potato motto. I still prefer for flavour the Lapstone to all others. Practically for freedom from disease I claim the palm for Hundredfold Fluke and Red-skin Flourball.

I had a few of the Early Vermont submitted to me. It seems to be a good form of Early Rose and cooks well, and if earlier than that variety deserves its name.—D., Deal.

#### HELLEBORUS NIGER.

PRESUMING that I have the same variety as "CENTURION" has submitted, I should like to advise its extended culture. Its blooms are 2 to 3 inches in diameter, of pearly whiteness, most of them having the accompaniment of a pink bud. It is a winter-flowering plant, and for cutting from is no unworthy rival to the beautiful *Eucharis amazonica* if only a hand-light or other covering be given to keep off the rains, which otherwise mar its purity and cleanliness by the up-dashing of the soil. A solitary plant thus protected is now, and has been for some time, producing a great profusion of bloom, which is extremely useful. This morning, under the anything but pleasant influence of 10° of frost, the blooms are as fresh as ever.

It is a plant that removes well, but is not of quick increase; and I think there is no real gain in dividing it into very small bits, nice-sized pieces establishing themselves so much quicker. The first fine weather after blooming is the best time for increasing stock, but good-sized flowering clumps transplant well at almost any time. Even if I had a chance of a supply in the hottest weather of July I should not say "No, thank you," but I should prefer them in autumn, as their growth would be certain then, and produce blooms at Christmas.

I imagine this is a very old-fashioned plant, but it must "come in" again. Both the season of its flowering and its beauty are claims to its future spread and increase, and it is worthy of being encouraged as incoming when nearly all other flowers have gone.—J. W.

#### DR. HOGG GRAPE.

ALTHOUGH this delicious Grape was sent out two or three years ago, it is very seldom seen in cultivation, and many good gardeners have probably never heard of it. Dr. Hogg Grape was raised and placed in commerce by Mr. Pearson, of Chilwell, a fact which is alone a guarantee of its merits. I have had no experience with this Grape planted out in a permanent border, but I was so much impressed with its good properties as exhibited by a Vine fruited in a pot last season, that I have decided on planting at least three in a smallinery this spring.

Dr. Hogg is a white Grape of the Frontignan class, but both in bunch and berry much superior in size to the old White Frontignan, though possessing the same exquisite Muscat flavour. It is a very free setter, with long tapering bunches, slightly shouldered; berries round and of good size, and it is an extraordinary bearer. The plant fruited here last summer was grown in an ordinary 10-inch pot; it was by no means strong, for it came from Mr. Pearson as a planting cane, but being anxious to see the fruit I allowed it to bear, and was rewarded with six fine bunches, which finished well, and weighed in the aggregate 8½ lbs. So fine were they, that I was able to exhibit three bunches in a collection of fruit at one of our local shows, where it was pronounced by many good judges to be one of the best new Grapes yet sent out. I have no doubt that when better known, and when grown under more favourable conditions, it will hold a prominent place among the best established varieties.—J. W. O.

### DISBUDDING MARÉCHAL NIEL—MANETTI STOCKS.

I HAVE in the open ground a Maréchal Niel Rose on the Manetti stock. It was planted in November, 1872, and last season threw out a shoot some 6 or 7 feet long, but did not bloom. I have this shoot well staked, and every point on it is now showing bloom. I counted on the 1st inst. twelve fully formed buds—I believe there are more. Ought I to remove the buds, or let them take their chance? If I remove them, are the same points likely to bloom again? Hitherto we have been unable to bloom this Rose here, and it is the only one we have not succeeded with, our Roses performing creditably at our local flower shows. I should perhaps mention that the Rose is not against a wall or protected in any way, but we are fairly well sheltered, and the season has been an exceptionally mild one here.

I shall also feel obliged if you will give me a hint as to where I can procure Manetti Rose stocks. I cannot obtain them from our nurserymen here. The Manetti is the only stock on which I can bloom my Roses to perfection, but certainly my soil is very light.—A COUNTY DUBLIN AMATEUR.

[We should advise you to let the buds remain. It all depends upon favorable weather whether they will open or not, but it will not interfere with its future blooming whether you leave the buds on or not; and if they fall off this spring, merely shorten the shoots to a sound eye, and do not cut back too hard. Manetti stocks can be had from several English nurserymen, as Mr. Cranston, King's Acre, Hereford, or Mr. Harrison, of Darlington. Once get a few good plants, it is easy to perpetuate your stock by cuttings.]

### TO YOUNG GARDENERS ON RENOVATING OLD FRUIT TREES AND OTHER SUBJECTS.—No. 2.

If there is any one thing more than another in which modern gardeners have advanced, it is restricting over-vigorous growth by root-pruning instead of by excessive branch-pruning, and so causing the production of bloom-buds rather than brushwood. Of course root-pruning is only resorted to when growth is made at the expense of fruit-bearing. To secure the full benefit of this system it is necessary to commence with young trees, although when practised with care and judgment it is likewise advantageous to old trees of rampant growth. In no case, however, should it be carried to excess, otherwise in a few years the tree will be exhausted by over-production. If we do not carefully study the right balance the fruits will be small and of indifferent flavour, and the channels for the flow of the sap will be so contracted that they will hardly expand, if at all. In such an event, therefore, it is useful to head-down, in order to secure new channels through which sufficient nourishment can pass to allow of the free development of the flowers and fruits. It is not from scrubby fruit buds that we obtain the best fruit, nor from a thicket of wood caused by excessive pruning, and furnished with a few weak bloom buds, but from young shoots of few years' growth. Here, then, is the happy medium between an assemblage of starved buds and over-growth—such, for instance, as that resulting from injudicious heading-back, where numbers of contending watery shoots destitute of fruit are produced. With espalier trees, again, I have seen a clean sweep made of all the spurs, leaving the branches like so many bean sticks. What can be expected from such treatment, if the tree is healthy, but a mass of

shoots, not a few blanks, and no bloom buds? "Pinch-in," you may say. So you may, and fresh growth will be the result. Root-pruning, however, in the autumn after this unpractical and unnecessary treatment may effect the object in view.

It is well known, when a tree has been subjected for years to excessive pruning, and has formed large masses of useless spurs full of eyes, that these are ready at any favourable moment to break into rampant shoots, which by their broad-gauge channels draw away the sap to such an extent that the contracted ways to the weak surrounding blooming spurs have not the least chance of carrying any nourishment, and the flowers unfold only to fall from want of this. It is generally found that the wood-producing clusters proceed from the main branch with a clean base of even a few inches long, and often the bloom-spurs around it likewise spring from the main branch. Here, then, is the opportunity to at once remove with a small saw or a knife the useless clusters, and leave the bloom spurs to appropriate the whole supply of sap that previously was consumed in building-up wood to be at once displaced. The whole economy of the tree is disordered should there be bloom buds intermingled with the clusters of wood-producing eyes, and not around and beneath. In this case have a fine saw or pair of French nippers, as I call them, and take out all except the bloom buds. I have often made trees which were considered shy bearers before produce a good crop by this treatment.

The preceding remarks mostly have reference to horizontal-trained trees, but the same treatment can be employed for bush, pyramid, standard, or any other form that has to be subjected to spur-pruning. As to trees that have not been kept pruned, I will give one instance of renovation out of many: Some large Blenheim Orange Apple trees, said to date from the first introduction of that noble variety, had grown with a clean stem of 2 feet high, and had then been allowed to spread out their branches without interference. This had been going on for years. Being in a soil and situation well suited for fruit trees they had grown as only the Blenheim Orange can grow, but produced little fruit for their size. At length the garden had to be re-arranged, and these trees, being in the middle of it, were quite out of place. To grub them up was not to be thought of; to head-down such vigorous trees was also voted impracticable. What, then, was to be done? Just this: Take a chisel with a long handle and mallet, and remove all the extended straggling branches, which are the proper parts to attack—not those near the stem, the removal of which causes ugly wounds. The heads were thus brought into something like uniformity in shape, light and air admitted to the middle of the tree; and the result was that all the smaller branches studded with weak bloom-buds were thrown into a state of high productiveness. Meanwhile the garden was trenched three spades deep, and all straggling roots judiciously shortened, not as we have lately read—viz., by taking out a trench 2 or 3 feet from the stem, with an axe rudely demolishing all roots even if as thick as one's leg, then filling-in the hole with dung, &c. No: If this is the only practicable method that can be adopted to renovate, it is best at once to replace with young trees. Bear in mind, the soil was well suited for fruit-culture, being a marly loam 3 feet deep on an open subsoil of a gravelly nature, formation volcanic, aspect south. If it had been otherwise, no doubt it would have been necessary to have mined under the trees, to cut off any roots going down into subsoil.

A tree in a weak or exhausted condition requires different treatment. It is well to reduce the head considerably, and then look to the roots, not cutting off those which are sound and healthy, but carefully removing all old exhausted earth, replacing it with new, sound, rich soil. Remember not only to place it within 2 or 3 feet of the stock, but also for as many yards. Here you will fall in with the feeders, which will at once appropriate the food obtained. Do everything to encourage vigorous growth; displace old with young wood; should this become too gross and not fruitful, prune the roots, but with great care. Avoid whenever possible the amputation of large roots or of the branches of large trees; the shock to the system is too severe.—J. T., *Maesburyne*, S. Wales.

AN OLD TRUEPENNY.—As all kindly notices relative to gardeners are acceptable to your readers, I forward you the epitaph of one copied from a tombstone in the old churchyard of Hunstanton, Norfolk.—G. E. CHICK.

JOHN RIPPINGALE, a faithful and attached retainer, served for seventy years as gardener during five generations of the L'Estrange family, one of

whom placed this stone to his memory. Died Oct. 11th, 1870. Aged 83. "Their soul shall be as a watered garden, and they shall not sorrow any more at all."

## OBTAINING GERANIUM AND ROSE FLOWERS IN WINTER.

I MUST not complain of my greenhouse, as, having followed your kind advice, it is now a blaze of beauty; but I cut down in the summer about fifty beautiful plants of Geraniums, and scrupulously picked-off every bud, in hopes they would flower profusely all winter, and they do not, except Geranium Perilla, which just gives a few blossoms for bouquets. Why is this? I keep the house at about 65° during the day, and in this weather admit plenty of air, and at 55° at night; sometimes it has been as low as 45°. Do I water them too much? for they make such growth.

I have a *Maréchal Niel* Rose coming into flower in the same house. It is not in a pot, but in the ground; one bud is very large, and at present looks healthy, but I am anxious to know at what temperature to keep the house; for another Rose, *Adam*, planted close to the *Maréchal* three weeks ago, was full of bud, and to my great dismay, although the foliage looks perfectly healthy, every bud became yellow and dropped-off; but as I say, the foliage looks very healthy, and I see other buds are forming. The only reason for this terrible disappointment which I can suggest is, that there is a Strawberry shelf quite at the top, and when these plants are watered the Rose gets more than it likes of the drip.—F. P. G.

[It is rather difficult to advise about Zonal Pelargoniums for winter blooming without seeing the plants or the house in which you grow them. We rather imagine from your account that you have treated them too kindly. It is not a good plan to pick-out all the flowering eyes, as it induces plants to make wood, or rather to grow instead of blooming. We never in our experience find that the Geranium blooms less in consequence of having a sufficient amount of bloom always left on, and if plants are cut-back and repotted in summer it is not a good plan to disbud too much. Of course, specimen plants that have been grown for summer blooming will not bloom again so freely in autumn without a rest and top-dressing. Plants, also, for winter blooming should not be overpotted; and though we are advocates for a sufficiency of water, there should not be too much given so as to encourage overmuch growth. Plenty of light and a good warm dry atmosphere, top-dressing rather than overpotting, seem to be the requisites for winter blooming. Your temperature on the whole is too high, and very likely you are giving moisture for the sake of your other plants. Have you Pearson's Hybrid Nosegays, as Mrs. Lowe, Bayard, Arthur Pearson, Chunder Sen, &c.? they are by far the best strain we know for winter blooming; also, among Zonals, Vesuvius, Corsair, Jean Sisley, Rev. C. P. Peach, two of which are Mr. Pearson's? Some of his new pinks promise also well for winter pot-plants, as Mrs. Fytche, Confessa Quarto, and Mrs. Musters. An 8-inch pot is quite large enough for plants for winter blooming, and the best plan is to select good plants at bedding-out time, pot them in from 4 to 6-inch pots in June, and give them another shift to 7 and 8-inch pots early in August, stand them out in a sunny warm place in August and September, and bring them in in October. Merely pinch-in to promote even growth. Do not disbud or cut-back too hard.

As *Maréchal Niel* is planted in the ground, and has good buds on it, we do not advise too much temperature, otherwise you excite growth when the roots cannot supply sufficient nourishment. A day temperature from 55° to 60°, and a night one from 45° to 50°, will be quite sufficient. Tea Roses will often drop their buds from want of sufficient light. Light is the most important of all things for winter forcing to enable the plant to fix the carbon, which in dark days is given off as carbonic acid.]

## ROUND-LEAVED BATAVIAN ENDIVE.

I WAS surprised on reading the observations of "W.," in last week's JOURNAL OF HORTICULTURE, respecting the above-named Endive. I take no objection to what he says as to its growth being "particularly compact, less leafy than many other Batavian Endives, and consequently more edible in heart and midrib;" but I do object to seeing old things being sent out as new, or with a name other than that under which they may be had at a tithe of the price.

In 1873 I procured a packet for 1s. 6d. of the novelty "Round-

leaved Batavian Endive," and the usual quantity (1 oz.) of Fraser's Improved Broad-leaved, and sowed them both at one time, and adjoining each other. They were grown alike, planted-out when fit, part were blanched on the ground and part in frames, and in all cases adjoining, so that a difference, if any, could be noted. (Growing some hundreds of each any difference would have been apparent, but so similar were the two that no one, myself included, could distinguish the least dissimilarity in any stage of growth. As to any superiority of the Round-leaved over Fraser's Improved Broad-leaved, there is none, both being good.—A.

## OLD FRIENDS WITH NEW NAMES.

"New vegetables are scarce, although new names are ever abundant and bewildering," writes Dr. Hogg in his "Year-Book" for 1874—a dictum which, we apprehend, none will be found hardy enough to gainsay. Regrettable as are this abundance and bewilderment in respect of new names too freely conferred on old acquaintances, still more to be regretted are the confusion and errors of nomenclature, and the synonymic obscurity, which go to increase the bulk, but, at the same time, materially decrease the value of seedsman's catalogues. As the spring issues are now being prepared and fledged for the coming flight, we would impress on their proprietors and compilers the desirability of taking advantage of what has been done up to this, with a view to bring order out of the preceding chaos. They will deserve best who will do most to correct errors of nomenclature, and will dare to let the genuine thing, freed from a rubbishy heap of synonyms and pseudonyms, stand forth upon its merits. Now, for example sake, let us take our national esculent, the Potato. It appears that out of 189 varieties tried in the Chiswick Garden last season only 111 were found to be distinct, 75 being merely synonyms. As many of our readers are now, or soon will be, thinking of purchasing and getting some early Potatoes down, it may be as well they should know, if they go in for "kidneys," that *Alma Kidney*, *Benson's Seedling*, *Cambridgeshire Kidney*, *Cave's Seedling*, *Champion Kidney*, *Conqueror*, *Early May*, *Early Ranelagh*, *Laing's First Crop*, *Nonesuch*, *Nutbrown*, *Reynard*, *Styllian's Kidney*, *Tory*, *Shepherd's Kidney*, and *Veitch's Improved Ashleaf* are neither more nor less than *Kentish Ashleaf*. Here are sixteen impostors under assumed names. Why not at once expunge the whole crew from trade lists? Then, again, *Derbyshire Prizetaker*, *Lee's Hammersmith Kidney*, *Myatt's Prolific*, *Rivers's Royal Ashleaf*, and *Sandringham Kidney* are only *Myatt's Ashleaf*. Here is another batch of pretenders which should be sent to the rightabout. Then again, *Duckstone*, *Margoline*, *Mona's Pride*, and *Oakleaf* are simply the old familiar *Ashleaf Kidney*. Our good, albeit rather flat, old friend *Lapstone* has his merits and his honours surreptitiously assumed by the following pretenders—namely, *Cobbler's Lapstone*, *Haigh's Seedling*, *Headley's Nonpareil*, *Huntingdon Kidney*, *Pebble White Perfection*, *Nixon Pippin*, *Ashtop Fluke*, and *Almond's Yorkshire Hero*. The name of the rightful owner suggests strapping these scoundrels from the company and column in which they have too long passed muster.

The Regent is a great favourite in the London market, and, perhaps, deserving of more extended cultivation here than has been hitherto accorded to it. His regency was too successful to remain undisturbed, and we accordingly have *Early Oxford*, *Mitchell's Prolific*, *Pink-eyed Regent*, *Rintoul's White Don*, *Rusty Coat*, *Rough Jacket*, and *York Regent* traitorously attempting his deposition. Who is it that has not heard of or seen in print the praises of *Red-skinned Flourball*? Nay, further, the pictorial art has been called into requisition to make us familiar with his rubicund countenance—*ores atque rotundus*. And yet, notwithstanding all this, some have been uncharitable enough to hint (and we must confess our own experiences point to the same conclusion) that at certain periods, and in some soils, at all events, *Flourball* is a misnomer, and *Soapball* would be more appropriate. Be this as it may, he is a fine, good-looking fellow, with a very prepossessing appearance—qualities quite sufficient to win a measure of success, and consequently bring forth a bevy of aspirants to outshine him under the names of *American Red*, *Barkshire's Red-skinned Flourball*, *Boston Red*, *Improved Red-skinned Flourball*, *Kentish Red*, and *Red Peach-blossom*. And, gentle reader—shall we tell it?—these half-dozen ingrates are no other than the offspring of the veritable *Flourball* himself.

We might go on with the list, but the foregoing in the matter

of one esculent is quite enough to show the necessity for wholesome and wholesale excision in the compilation of trade lists, and care on the part of the trade and growers generally not to be hastily caught by glowing descriptions from self-dubbed raisers of so-called new varieties, and by flashy testimonials from their friends. On another occasion we may have a word to say with regard to one or two other of our garden vegetables.—(*Irish Farmers' Gazette*.)

## THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 14.

"DELIVER me from my friends, and I will take care of my enemies," was the remark of a somewhat cynical philosopher, wide-awake to the fact that one has often more to dread from those whose aspect is friendly to appearance than from open opponents. In the pursuit of horticulture it is not always easy to distinguish friends from foes among the insect tribes, and there is a pretty general feeling that insects found crawling or flying in gardens are rather more likely to be nuisances than benefits, and their fate is correspondent to the belief, often by design, sometimes by accident; for, unquestionably, when using freely certain famous "compounds," "insect-destroyers," and so forth, the gardener blends friend and foe in one undistinguished mass. And it is just possible that in some instances the killing of a predatory insect may be attended with the death of so many of its particular parasite that matters are about equally balanced as to results. The march of intelligence is doing much, however, for the gardener, in leading him to regard the insect world in a very different way from what it was viewed by his predecessor, say in the good old times of George III. In the case of the agriculturist the progress is slower; but one hopes by-and-by the few labourers that Mr. Arch and his friends intend to leave us will do some credit to the advanced civilisation of the nineteenth century, unless, indeed, they are over-petted. Meanwhile not only Hodge, but his master, seem slow to renounce ancient prejudices; vainly have I of late appealed against the shooting-down of rooks in these winter months, because of the mischief they are supposed to have done in Turnip fields. A reference to the "grub" as the real enemy of the Turnip crop does not alter the case in the bucolic mind; for it stands thus: Admitted the grub; well, does not the rook, in its searches after the insect, unearth the Turnip, and thus finish-off the destruction commenced by the invisible enemy? Whereas, for the most part, so sagacious are rooks that it will be found they attack those Turnips which would hardly ever come to any good, though they may now and then root-up sound ones; also, I believe the species may be in a great measure exonerated from the accusations brought against it with reference to grass and Potato fields.

Returning to our more immediate subject, I would here note that there are a good many species of the Dipterous order that are of service to us by seizing and devouring other insects of various orders, though they do not diminish our enemies so effectually as do the larvæ of the Syrphidæ and Tachinidæ. Few, if any, of the flies are useful to us in both the larval and winged condition; and the flies, so agile on the wing in summer, and eager in pursuit of their prey, are mostly feeding quietly in the winter on refuse of an animal or vegetable nature, or, in a few instances, on the roots of plants. The transformations of these are as yet imperfectly known, being difficult to observe. The majority of the flies friendly to us belong to the section *Brachycera*—the "short-horns," in fact, which also includes some of the greatest enemies of man and domestic animals. Among the latter the Cleg, the Horse-fly, and the Gad-fly are names of terror, and those belonging to the genus *Tabanus* (fig. 1) are remarkable for strength and fierceness, with lustrous eyes of varied colours. Though these attack cattle (at least, the female insects), it is believed they also make other insects their prey; but are more usually to be seen on the wing in pastures and about woods, and not in gardens. Flies of the genus *Asilus*, some of which are very familiar objects, are common about roadsides, and occasional visitants in gardens; also, like the *Tabani*, exceedingly active and almost as ferocious as are the Dragon-flies; worse in character, possibly, as they are of a cannibal turn.

*Asilus crabroniformis* (fig. 2) is a handsome fly, well clad with hairs of a tawny hue, except on the front of the abdomen, where they are deep black. The wings are also of a golden hue, and gleam in the sunshine when the insect buzzes

over flowers, to which it frequently resorts for various purposes. One object it has is to seize some insect so intent upon honey that it is off its guard, and an *Asilus* may be seen sweeping through the air with a bee in its grasp, being apparently indifferent to the danger of being stung. A variety of insects, however, furnish food to the *Asili*; and these flies also make caterpillars their prey, and as they do not devour their victims, but only suck their juices, one fly may in its lifetime kill many insects. The larvæ of the *Asili* feed under cover, either on decaying roots and stems of plants, or in holes in trees which have been excavated by others. A curious peculiarity possessed by the fly is the three-padded foot, by means of which the hold upon whatever is seized is rendered more tenacious. Recently, at Woolacombe, North Devon, Mr. F. Smith observed a silvery species of *Asilus*, which afterwards proved to be *A. albiceps*, eager in the pursuit of grasshoppers, numerous on the grassy slope where the fly occurred. A species of feeble flight of the genus *Leptis* (*L. scolopacea*) furnishes another example of the three-padded foot to those

Fig. 1.—*Tabanus autumnalis*.

Fig. 2.—*Asilus crabroniformis*.

desirous of examining it; this being common in shady spots, as well as in gardens. The thorax is striped, the abdomen spotted in the centre, and the wings edged with grey or brown. The larvæ in this family are little known, only of one foreign species it is stated that it is parasitic in habit, and obtains the small insects it feeds on by constructing pitfalls in sandy earth. This is more notable, because the great bulk of the larvæ of flies (*vulgo*, maggots) display very little sagacity, and do not seem capable of much in the way of constructive art beyond the making of a cocoon.

Amongst the Empidæ the same habit prevails as we find in the gnat tribes. The males are harmless, and employ themselves in sucking honey, while the females are predacious. The tongue in these flies is long, and its appearance has led to their being designated Snipe-flies; their legs also are of good length, and serve to embrace the moths and flies which the Empidæ seize and fly along with. *Empis tessellata* is seen through the spring and summer, so that it must either be more long-lived than most flies, or else there must be a succession of broods. In this species the thorax is grey, streaked with black, the legs are spiny, and the wings dusky in hue. The destruction of multitudes of the small moths of the Tortrix family is effected by this and other species of Empids, and, as is well known, many of these moths, as parents of leaf-rolling and mining caterpillars, are exceedingly annoying to the gardener. In some seasons it will be observed that these "flies

of prey" are much more abundant and diligent than in other years. Mr. Wood tells us, that he first had his attention attracted to an *Empis* by seeing a number of singular compound creatures flying about in a copse of Oak trees. He says, "A sweep of the net captured four or five, and disclosed the fact that the compound creature was, in fact, a living *Empis*, clasping in its arms the body of an Oak moth which it had killed, and into whose body its long beak was driven. The grasp of the fly was wonderful, and if the creature had been magnified to the human size, it would have afforded the very type of a remorseless, deadly, unyielding gripe." The Green Oak Moth (*Tortrix viridana*), is a species which in the larval state does great damage to the foliage of the Oak, and its multiplication is somewhat checked by the diligence of *E. tessellata*. As we very often discover in Nature, the *Empis*, enemy of moths, is itself attacked by a parasite, by means of which it is kept from increasing to an extent that might lead to the extinction of its favourite prey.

Smaller flies of the same family, though little noticed, do a quiet work for the gardener's benefit in the removal of other

Fig. 3.—*Bombylius major*.

Diptera that are amongst his enemies, and also, probably, winged Aphides and Coccis. Such are the *Dolichopidæ*, minute but active flies, as often to be observed running actively over objects as on the wing, and the larvæ of which are presumed to be predatory for the most part. These are abundant. A scarcer insect, near akin to the *Empidæ* proper, is *Rhampomyia pennata*, the male of which has legs densely covered with flattened scab-like hairs. Both sexes are black; the female's shanks are, however, destitute of this peculiar covering for ornament or defence. Lastly should be mentioned at least the Bee-flies, more common in hot climates than with us, but of which we have some representatives. These could hardly be mistaken for bees by an ignoramus, the contour is so different, and the sound they produce is also unlike the brisk hum of most of the bee race. Though frequent in their visits to flowers, over which they poise themselves and obtain the honey by the help of the proboscis without settling, they now and then, it is suspected, make bold to seize surreptitiously some near or distant relation. The larvæ are in one or two species carnivorous in habit. *Bombylius major* (fig. 3) is a Bee-fly tolerably conspicuous, and if startled it glides away with a rapid movement of the wings, though all the while they are at full stretch and seemingly motionless. This is rather more than half an inch in length, black, and clothed with yellow hairs; round the edge of the wings there runs a waved brown line. We may at once distinguish an *Empis* from a *Bombylius* by the long proboscis being bent down in the former, whereas in the latter it is stretched out in front.—J. K. S. C.

much equality in two stands as to make it difficult to decide, then variety and correct and tasteful setting may justifiably be brought in to decide a doubtful case.—D., *Deal*.

## ROYAL HORTICULTURAL SOCIETY.

### SPECIAL GENERAL MEETING, JANUARY 28TH.

THIS was called by the Council in conformity with bye-law 50, twelve Fellows of the Society having demanded such a meeting for the purpose of taking into consideration the amendment of the existing bye-laws, by the passing of a new bye-law for enabling all Fellows to vote by proxy at all general meetings of the Society.

Sir A. SLADE, Bart., took the chair, as Viscount Bury, who was to have presided, had not arrived, and said that the Council had received from Mr. Bateman the copy of a resolution which he intended to propose—viz.

"That the Fellows of the Royal Horticultural Society, assembled in general meeting, resolve that all Fellows of the Society ought to have a right to vote by proxy at all general meetings of the Society, and call upon the Council to confirm the bye-law submitted in March last to that effect."

On this the Council held a meeting at which their legal adviser attended, and he was of opinion that as the proposed bye-law had been rejected at the Special General Meeting of March 26th, 1873, the Council had no power to submit it.

After some argument on this point, Mr. BATEMAN, in proposing his resolution, said, that the circulars to which his name was attached had been largely responded to; as many as two-fifths of the debenture-holders (in money), had signified their assent, showing that there was a strong feeling among an influential portion of the Society that its Fellows should have the right of voting by proxy. Here Mr. Bateman cited a number of names of the nobility and horticulturists among his supporters. When he joined, forty years ago, the Society consisted of two classes, the horticulturists *pur sang*, and those who liked the amenities of horticulture, but the situation had entirely changed since the head quarters had been transferred to Kensington—there a new *quartier* had sprung up, of which the inhabitants liked to promenade in the gardens, and in the regulation of the gardens they had already achieved some considerable successes. The preponderance of the Fellows, however, reside in the country, and it was only fitting and proper that these should have the same voice in the management as those near at hand. If the Chairman refused to put the resolution read, he should then propose the following:—

"That the Fellows assembled in general meeting hereby instruct the Council to make forthwith a new bye-law to the following or like effect—viz.: Every Fellow of the Society shall be entitled to appoint, by written proxy (in form marked D), any gentleman being a Fellow of the Society, to vote for him or her at all or any general meetings of the Society, and to submit the same to the Fellows for confirmation at the expiration of a certain number of days, and that this meeting stand adjourned for the purpose of confirming this bye-law."

The original resolution was then moved by Mr. Bateman, and seconded by Lord Alfred Churchill.

Sir CURTIS LINDSAY, Bart., said that the Council were in no way antagonistic to the meeting, but, on the contrary, were desirous to carry out the views of the majority of the members. Still, in consequence of the opinion of their legal adviser they were unable to accept the resolution just proposed. The Council would, however, adopt every means to enable gentlemen to bring forward or pass the resolution at some future meeting. The proposition had been negatived last March, and it would be preposterous for the Council to submit the same subject to a meeting with not one-third of the number present on that occasion.

Lord Bury having arrived, took the chair at this stage of the proceedings.

LORD ALFRED CHURCHILL contended there was no provision in the Charter to prevent a proposition previously negatived being put fifty or a hundred times over, and that voting by proxy was accorded in joint-stock companies. The resolution was not proposed in a hostile spirit to the Council, but that the whole body of Fellows should have the power of passing an opinion on anything that might be submitted to them. They all knew the present Council were at the Board owing to the absence of proxies last year. The incubus was now thrown on his friends and himself of saying the Council were acting as they did to retain their seats. He did not say that was their intention—indeed, he believed it was not; but the matter was one for the opinion of the whole of the Fellows.

Mr. P. LEONARD regretted to find himself at the beginning of 1874 in the same predicament as in 1873, when propositions were made which would have deprived the Fellows of the use of their gardens. On proceeding to remark on some other acts of the old Council, the speaker was recalled to the question by the Chairman, and went on to say that the resolution was part of a circular emanating from the late Council. First he had a circular signed by Sir Daniel Cooper, imploring Her Majesty's

JUDGING ROSES.—I made one omission, thanks to my friend Mr. Charles Turner for reminding me of it. Where there is so

Commissioners to see the Society out of its difficulties. Then there was Mr. Bateman's circular, and the attempts that were being made to show that the Society was in a state of insolvency, whilst, in point of fact, it would be able to pay 20s. in the pound as soon as the Commissioners paid the balance they owed. He contended that the present Council had extricated the Society from its difficulties.

Mr. H. LIGGINS thought it remarkable that in a Society, now established for fifty [seventy] years, the members had never applied for the privilege of voting by proxy. He would not give the right of voting by proxy; members should hear both sides of a question, and those who were absent did not know all that was going on. The clear object of the gentlemen who got up this movement was to get vote by proxy in order to carry some proposition by which to turn out the present Council. Who signed the requisition for the meeting? Six of the old Council signed it. That showed the object of the movement.

Mr. D. T. FISH was there at the summons of the Council, and he wished the Council would in future get the opinion of their legal adviser before they summoned a general meeting. Why should he have had to travel a hundred miles at the summons of the Council? Every member who lived in the country wished for vote by proxy. They had the advantage of a horticultural press, conducted with great ability, and through it they were always well informed of what was going on in London respecting the Society.

Mr. W. HAUGHTON said the proposition before the meeting was, that male Fellows ought to have the right of voting by proxy. He was opposed to dividing the Society into factions, but was it right that the Kensington minority should rule the three thousand members of the Society? He had looked through the Charter and bye-laws, and could not find in them any rule forbidding a resolution previously negatived being passed. The opinion of the Society's legal adviser, as he took it, meant that the Council of their own mere motion could not bring forward a resolution after it had been negatived at a general meeting.

A FELLOW stated that he had travelled 120 miles to attend, and if the Council knew the resolution could not be put, the country members ought to have been apprised of the fact.

THE CHAIRMAN: They are obliged to summon a meeting.

After considerable discussion as to whether the resolution should be submitted to the meeting, the Council having decided not to act in contravention of their legal adviser's opinion, Sir A. SLADE said in answer to Mr. Taylor, the Charter permits the Council alone to make bye-laws. Bye-laws otherwise made have no binding effect upon the Society.

LORD A. CHURCHILL replied that if the resolution were passed it would be an instruction to the Council to make a bye-law.

Mr. C. H. PINCHES remarked that he had been at some pains to go over the list of Fellows, and found that those outside the London district were numerically one-fourth of the whole. Half of these—the ladies—could already vote by proxy, and therefore the number for whom that privilege was sought was only one-eighth of the Fellows.

Mr. BATEMAN denied that anything he had done in the matter emanated from the Royal Commissioners. If he thought he was being made a tool by the Royal Commissioners, or by a clique, he should not suffer it. He had been always opposed to the intrigues of the Commissioners. He considered the Society would not be able to maintain its independence without the establishment of vote by proxy.

THE CHAIRMAN said the Council had no proposal to make to the meeting. They had not called the meeting, but were compelled to do so through the requisition of twelve Fellows. It pleased these twelve gentlemen, and those who supported them, to say that the Council ought to propose a certain definite course of action to that meeting, but the Council reserved to themselves the right of forming their own opinions as to what ought and what ought not to be proposed; and, in the exercise of that discretion, they did not propose such a resolution as Mr. Bateman had brought forward. Mr. Bateman was indignant because it had been stated he had any connection with the Royal Commissioners; but Mr. Bateman himself had led them into the mistake, because in the list of his supporters he read the names of Dr. Lyon Playfair, a Royal Commissioner, of Mr. Edgar Bowring, a Royal Commissioner, and of Lord A. Churchill, a member of the old Council. Behind Mr. Bateman sat the great Mr. Cole himself, and General Scott, so what were people to think? The Council did not tell the meeting what their opinions on the question of vote by proxy were, they only said they thought this was not the occasion on which the question should be brought forward. Although the meeting might express an opinion on the question, the Council would not interfere with that expression, take any action upon it, or consider themselves bound to follow it. The Council were the heirs of embarrassments left by their predecessors, and if the fundamental mode of voting were changed, that change would only throw additional embarrassment in their way. If a different course of action from that hitherto pursued were preferred by the Fellows, let it be at the Annual General Meeting or some con-

venient time afterwards, when the Council would be prepared with a policy.

Mr. POWNALL moved an amendment that the further consideration of the subject be postponed till after the General Meeting. This having been seconded by Mr. Liggins and lost, the original resolution was put by the Chairman, who remarked, before doing so, that the Council must not be considered as mixing themselves up with the matter at all, but that he put the resolution formally as Chairman to preserve the harmony of the meeting.

Mr. Bateman's resolution having been carried by a show of hands, the meeting concluded.

We are requested to publish the following correspondence on the subject of the meeting above reported:—

"9, Hyde Park Gate, South, W.,  
"9th January, 1874.

"SIR,—As the subjoined resolution\* was yesterday carried (without counting 119 proxies with which I had been entrusted) by a large majority, I cannot but regret that the Council on merely technical grounds should have declined to produce the "bye-law" therein referred to, and so give immediate effect to the wishes of the Fellows.

"But as it is most undesirable that the matter should be left in its present uncertainty, I have to request, on behalf of the Fellows with whom I am co-operating, that you will kindly inform me, on or before the 16th inst., whether the Council are prepared to loyally accept the decision of the Fellows, and take immediately the requisite steps for the passing of a bye-law so as to enable the Fellows to vote by proxy at the next Annual General Meeting of the Society.—I have the honour to be, Sir, your obedient servant,

"(Signed), JAMES BATEMAN."

"The Secretary of the Royal Horticultural Society."

"Royal Horticultural Society, South Kensington, S.W.,  
"14th January, 1874.

"SIR,—In answer to your letter of the 9th inst., inquiring whether the Council of the Royal Horticultural Society are prepared to introduce the system of proxy-voting at the General Meetings of the Society in consequence of the opinion expressed by the Special General Meeting held on the 8th inst., I am directed to say that the Council, while considering that it will be their duty to carry out the wishes of the Fellows on this point as soon as those wishes shall have been finally expressed, cannot look upon that meeting as having conclusively settled the matter.

"It appears to the Council that the innovation proposed is so grave that they would fail in their duty towards the Society if they were at once to concur in the policy adopted by the majority at that meeting.

"I desire to remind you that the meeting of the 8th inst. was promoted solely by yourself and your friends, without any corresponding interest shown by those opposed to you; also that the meeting, even when promoted by so much diligence, was, as compared with the meeting which rejected proxy-voting last April, poorly attended.

"In conclusion, I have to state on behalf of the Council that they will give this subject very careful consideration, and will call another meeting specially to decide upon it when the largest portion of the Fellows are in town, and can attend to express their views.

"The Council intend to publish this correspondence.—I have the honour to be, Sir, your obedient servant,

"(Signed), W. A. LINDBAY, Secretary."

"James Bateman, Esq., F.R.S."

## PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

*SAXIFRAGA PELTATA*. *Nat. ord.*, Saxifragaceæ. *Lin.*, Decandria Digynia.—Native of California. Flowers white, tinged with pink. "Variable as the foliage of the Saxifragas is, the present is the only one known in which that organ is completely peltate, and like many other peltate-leaved marsh and water-loving plants, this is stated to be found on the margins of streams and in the water itself."—(*Bot. Mag.*, t. 6074.)

*XANTHORRHIZA QUADRANGULATA*. *Nat. ord.*, Juncæ. *Lin.*, Hexandria Monogynia.—"It is a native of South Australia, where it inhabits rocky hill ranges, and was sent to Kew by Dr. Schomburgk, the energetic Director of the Adelaide Botanic Garden. Shortly after its arrival the trunk, which is 4 feet high, slowly developed its fresh green leaves, which

The Fellows of the Royal Horticultural Society assembled in General Meeting resolve that all Fellows of the Society ought to have the right of voting by proxy at all General Meetings of the Society, and they call upon the Council to submit to them for confirmation the bye-law made by the Council in March last, enabling all Fellows so to vote.

steadily increased in number and length till the plant had the appearance given in the plate; the flower stem and Typhalike spike commenced to emerge about July of last year, and attained its full development in September, when the flowers began to expand from below upwards, and a full month elapsed before all had opened. During flowering time a copious honey-like secretion was exuded, which hung in great tear-like drops to the brown spike."—(*Ibid.*, t. 6075.)

*COLCHICUM SPECIOSUM.* *Nat. ord.*, Melanthaceæ. *Lin.*, *Hexandria Trigynia*.—Native of the Caucasus. Flowers reddish purple. "The largest known species of the genus, and a very handsome one, a native of the countries bordering the Caucasus range on the south, and extending thence into Persia, if, as appears to be the case, a Ghilan plant of Aucher Eloi (n. 5370) is the same species. Ledebour in his 'Flora Rossica,' says that it inhabits the provinces of Mingrelia, Iberia, the Suwant, Lenkoran, and the south-west shores of the Caspian Sea. It has been for some time known to amateurs in England, though not hitherto figured in any English work. *C. speciosum* has been cultivated for many years in Kew, but the specimen here figured, which is much more deeply coloured than the Kew one, was sent by Messrs. Barr & Sugden, who have a fine collection of the species of this beautiful genus."—(*Ibid.*, t. 6078.)

### NOTES AND GLEANINGS.

DR. E. REEGL, Director of the Botanical Gardens, St. Petersburg, has published a work on the SPECIES OF VINES met with in North America, Northern China, and Japan, in which he discusses the long-controverted question of the origin of the Vine. According to him, the cultivated Vine, which forms our vineyards and produces our wines, is not a distinct and separate botanic species: it is a hybrid of two species belonging equally to the genus Vine—viz., *V. Labrusca*, L., and *V. Vulpina*, L. The former of these two species is met with in a wild state in Northern America, in Japan, in Manchuria, and in the Himalayas. Its leaves have their inferior face covered abundantly with a cotton-like down. The second species, which grows naturally in the same countries, has upon the inferior face of its leaves only small hairs, short and very stiff, upon the nerves. The first of these two species has furnished the two most remarkable varieties of American Vines—the Catawba, much cultivated for the production of wine, and the Isabella, the grape of which, sought after for the table, has a perfumed flavour and peculiar odour, agreeable to some, but disagreeable to others.

—THE FINEST KITCHEN GARDEN in France is that of VERSAILLES, which belongs to the State, and brings in a yearly revenue, taking good and bad years together, of about 20,000 francs. The Assembly has determined to apply this valuable property to the formation of a model market garden and school of horticulture. The details of the institution are not yet arranged, but it is presumed that it will be self-supporting, and that it will render valuable assistance in the development of horticultural science in France.—(*Nature*.)

—THE CONSUMPTION OF IMPORTED POTATOES must be very large. The declared value imported in the last twelve months was £2,121,235; in the preceding year, £1,654,240.

### NOTES ON VILLA AND SUBURBAN GARDENING.

NOSEGAYS AND CUT FLOWERS.—Though these are very acceptable to most persons, there are few who rightly understand the art of keeping them long in a fresh state, or reviving them when they have faded. It is true that when a flower or branch is cut off from its parent plant its support is thereby destroyed, but still some flowers may be kept in great beauty for a much longer period than others, and many for a far longer time than is generally done, or even supposed possible. For this purpose flowers should be gathered early in the morning, but not till the dew be nearly dried off them. They should be placed in a flat basket or on a tray so as not to press upon and crush each other, and they should be neatly cut, and not mangled or bruised. When thus gathered they should be covered with a sheet of paper and immediately conveyed to the apartment where they are to be used (Messrs. Dick Radclyffe & Co.'s would be a neat and handsome bouquet-holder for the purpose). But if they are to be sent to any distance they should be placed in tin cases, such as botanists use when collecting specimens. In this way the Dutch florists send specimens of their finest flowers, not only to England, but to mere distant parts of continental Europe. Our own florists send to the metropolis, for competition at ex-

hibitions, flowers from Cornwall, from the north of England, and from Scotland, and they arrive without the least decay. They are placed in wooden or tin boxes having an internal arrangement of small phials fixed under a covering of tin just large enough to admit the stalks of the flowers, the ends of which are placed in the water of the phials, and in this way they are conveyed with perfect safety.

Flowers should not be cut during sunshine, or kept exposed to the solar influence, neither should they be collected in large bundles and tied tightly together, as this invariably hastens their decay. When in the room where they are to remain, the ends of the stalks should be cut clean across with a very sharp knife (never with scissors), by which means the tubes through which they draw the water are left open, so that the water ascends freely; this it will not do if the tubers of the stems are bruised or lacerated. A thin slice should be cleanly cut off from the end of each stalk every time the water is removed, which will occasion fresh action and revive the flowers. Water about milkwarm or containing a small quantity of camphor will sometimes revive decayed flowers. The best method of applying this is to have the camphor dissolved in spirits of wine, for which the common camphorated spirits of the druggists' shops will be quite sufficient, and add a drop or two of this for every half-ounce of water. A glass shade is also useful in preserving flowers; and cut flowers ought always to be shaded during the night, and, indeed, at all times when they are not purposely exhibited. The following are some of the genera of plants, the flowers of which remain the longest after being cut—*Gnaphalium*, *Astelma*, *Helichrysum*, *Phenocoma*, *Aphelexis*; and others which the French have designated "immortal flowers," from remaining unchanged by decay, hold the first rank.

ROCKERIES.—For ordinary purposes, the materials of which a rockery, however small, is formed should lie on their broadest or flat sides, and not be set on edge, much less be placed with their points upwards. Little deviations may occasionally be allowed for variety, but the mass will have more appearance of solidity and strength, and be more accordant with Nature's teaching if each piece be laid flat with the outward edge tending a little downwards rather than upwards. Any great elevation should never be sought in small rockeries. This would be inconsistent with their breadth, and would render them too prominent and artificial. They should not be carried higher than the point at which they can be well supported, and backed with a broad mass of earth and vegetation. To grow Ferns upon them the shade of trees or some other objects will be indispensable; but many rock plants prefer an open sunny situation, so that rockeries should not be entirely shaded. *Cerastium Biebersteinii*, with its white leaves and whiter flowers, and procumbent habit of growth, is admirably adapted either planted in a recess or suspended gracefully over the front of some stone. *Arabis procumbens* is also a beautiful plant for a like purpose. *Aubrieta purpurea grandiflora* is a charming purple spring plant. Mr. D. Thompson's interesting paper containing most useful hints on alpine plants for spring bedding, and Mr. G. F. Wilson's list, are well worthy of notice for rockeries. Plants with trailing habit, evergreens, and a few of the less delicately-branched weeping kinds, and those which assume a wild, rugged, and picturesque character, are most suitable for rockeries.

As neatness should always be a leading feature in the villa or suburban garden, everything that can be done to promote this should be forwarded now, when little else can be performed. Anything that appears unsightly and that will make manure should be removed to the rot-heap, which should be turned over occasionally and covered with a little soil. This prevents all noxious effluvia from escaping; the soil also mixes among the decaying vegetables and becomes excellent compost. Soap-suds have a good effect on many kinds of vegetables, and should not be thrown away; they act beneficially on soils where Cabbages are infested with the club, and in some instances have been known to entirely cure that disease.

VEGETABLES.—A sowing of Radishes may be made on a warm border, but they must be protected from frost by covering the bed with straw. If any digging or trenching yet remains to be done, no time should be lost in getting it forwarded while the weather will permit.

FRUIT.—In planting Gooseberry and Currant trees care must be taken to thin them well out in the centre, so as to admit plenty of sun and air. The same remark is also applicable to standard Apple trees: the middle of the trees must be kept quite open, taking care that all the branches lead outwards, and preserve a regular distance from each other. Pear trees should also be well thinned, and the produce will be much better in quality.

FLOWERS.—Pelargoniums, Fuchsias, &c., in pots should have as much light and air as possible; they should be sparingly watered, and this ought always to be done in the morning. If they are inclined to grow up tall and slender, the points of the shoots may be pinched off with the finger and thumb, and this will induce them to throw out side branches, and make them dwarf and bushy. Anything that is likely to be injured by

frost should be carefully watched and protected from it by straw or fern.—W. KEANE.

### THE BALLARAT BOTANICAL GARDEN.

ENGLISHMEN and their descendants, and consequently the productions of England, are gradually predominating over the world. We have an overflowing because a prosperous community, and the overflow goes on to distant lands, and establishes there the language, the industrious habits, and the vegetable and animal produce of their native land. They cling lovingly to these, for they emigrate, not because they cease to love their native land, but because they can thrive and advance their offspring better in the home of their adoption. This is shown by all that they write about, and by their revisiting, "the old home;" and we do not fear to be thought mandarin when we write that our eyes are dimmed when we remember the boat alongside the emigrant ship, and the two larks in an old stocking handed-up as a parting gift to be naturalised and remind of home in the land across the Atlantic.

This last-written word reminds us why we now took up our pen. We have had sent to us, and we have had engraved to place before our readers, a corner of the Botanical Garden at Ballarat. Twenty years ago the place had no existence. Ballarat is the earliest of the large gold-diggings in Victoria, and is about one hundred miles from Melbourne. The digging commenced in the September of 1851, and in a few months within the space of a square mile seven thousand adventurers were congregated. It is now populous. Nearly four thousand acres of Vines are cultivated, and the produce of wine large. The Botanical Gardens are on the western side of Lake Wendouree, and are thus noticed by one of the local newspapers—"The lake, formerly called the Wendouree Swamp, is one of the places of recreation of Ballarat. It was formerly overgrown with rushes, but by means of a steamer provided with a cutting apparatus a wide and long sheet of water has been cleared for boat races. The assistance of the Government has been asked in clearing the entire basin of weeds. The lake is the head-quarters of the Ballarat rowing and yachtsmen. On its surface are therefore to be seen gigs, out-riggers, and smart sailing crafts. At the eastern end are the boat-houses and landing-stages. On the western extremity of the lake are situated the Botanical Gardens, the taste in which they are laid out and the good order in which they are kept doing credit to the metropolitan gold field. A carriage drive runs round the gardens. Pedestrians can wander amidst shrubberies or feast their eyes on beds rich in flowers, or they can explore the mysteries of the labyrinth, in the middle of which stands the look-out tower. From the top of this building a good view of the surrounding country is obtainable. Our engraving represents the lake in the background, while in the foreground is a reserve, forming portion of the Botanical Gardens. The sward to the right, sheltered by a screen of bushes, is a favourite spot for picnics, and is in summer well patronised."

We know that the Society are anxious to receive contributions of plants from all our European botanical societies; and none need fear that they are sending hardy plants to an ungenial climate, for we know, from the report of the Victoria Horticultural Society, that it has the following collection of fruits, and that those which have been proved equal in production to those grown in Europe:—

389 Apples, of which .....	160	have been proved.
261 Pears " .....	33	"
33 Peaches " .....	18	"
8 Nectarines " .....	4	"
80 Cherries " .....	39	"
84 Plums " .....	43	"
38 Apricots " .....	28	"
136 Grapes " .....	81	"
31 Oranges (and others of the Citrus family).		
32 Figs, of which .....	6	have been proved.
32 Strawberries, of which ..	26	"

and collections of other less important fruits.

We have not any recent reports as to the growth of other members of the vegetable kingdom at Victoria, but we have the following from the Proceedings of the Wellington Philosophical Society, and this New Zealand neighbour is little to the south of Victoria:—

"ST. JOHN'S NURSERY GARDEN, WANGANNI, NEW ZEALAND.—This garden is situated at about five chains from the foot of St. John's Bush, a wooded cliff some 90 feet in height, bounding the town of Wanganni on the north-west. The garden is, from its situation, exposed to almost the whole of the sun's warmth,

and is also completely sheltered by the cliff from the prevailing wind—the north-west. Besides this natural protection, the north-western boundary of the garden is screened by a Hawthorn hedge extending along its whole length, and averaging in height about 28 feet. Behind the hedge is a running stream, the percolation from the Virginian Lake, by which the whole of the garden can be irrigated. The spot on which the nursery is laid out was formerly the old bed of the Wanganni River, and subsequently an ancient forest. On the surface, therefore, is an average of from 3 to 4 feet, in many places deepening to 6 feet, of decayed vegetable matter, while the subsoil is a rich alluvial deposit. Its extent is five acres, of which about two and a half are orchard, one devoted to nursery stock, and the remainder to specimen trees and shrubs."

The following table will give some idea of the luxuriant growth of the plants in this garden:—

Age from nursery 5' each.	NAMES.	Height.	Spread of branches.	Trunk at base.
		Ft. In.	Ft. In.	Ft. In.
3	Cupressus Goveniana	17 0	14 0	2 1 1
3	torulosa	7 8	7 0	1 3
3	Lawsonii	9 1	8 0	2 0
4	Benthamii	19 3	20 0	2 11 1
3	pendula	7 0	6 0	0 7 1
2	Knightii	7 9	6 0	0 6

## DOINGS OF THE LAST AND PRESENT WEEKS.

### KITCHEN GARDEN.

The continued fine weather has allowed us to forward all digging and trenching operations; and where this work is finished, so that little or no heavy traffic will require to pass over the walks, the *Box edging* has been cut and the walks freshly gravelled. We would rather do both operations late in the spring; but if this and similar work were delayed until the most suitable time, in all probability it would not be done at all. There is little to be said about the minor details of such work. Many persons like to have the *Box edgings* wide, but they are not only neater if they are kept narrow and dwarf in this department, but wide edgings are a sure refuge for slugs and other pests. If there are a number of gaps in the edging arising from unsuitable soil or other circumstances, causing an unsightly appearance, it is better to lift the whole and relay it. There may not be time to do the whole garden, but a part may be done one year and the rest when convenient. In applying the gravel see that all weeds are removed, and the old gravel stirred up with a fork to the depth of an inch or two. The walks should be left a little higher in the centre than they are at the sides—just enough to throw off the rains. If too high in the centre it is very uncomfortable to walk upon them, and there is no reason why it should be so.

Made a sowing of Windsor Beans on a south border, and sowed Hicks's Hardy White Cos Lettuce, Early Horn Carrot, and French Breakfast Radish under ground vineries. These vineries

are 3 feet 6 inches wide at the base, such as have been recommended by Mr. Rivers for growing Grapes. There is room for four rows of Carrots or Lettuce in each length, and the Radishes are sown between the rows, to be removed before the other crops are sufficiently advanced to be injured by them. Of course it would be bad policy to sow such seeds in ordinary garden soil. A reserve of dry loam is always at hand, and as this was rather lumpy it was passed through a gravel sieve, the rough portion being available for potting purposes; this was spread over the surface of the seed bed to the depth of 3 inches and the seeds sown in shallow drills.

A sowing of Cauliflower seeds may be made under any glass protection. Our Cauliflower plants under hand-lights were late this year, but they are growing well, and will not have so much tendency to button as larger plants would. It is always advantageous to the plants to dress the surface of the ground outside the hand-lights with rotted manure, as, should a severe frost set in, the manure prevents it from penetrating the ground, and thus saves the plants. Stirring the surface of the soil round the plants with a small fork or pointed stick is advantageous.

### FRUIT AND FORCING HOUSES.

*Pine Apples* which were in their fruiting pots by August, and have been at rest from the first week in November, should now be started. It will probably be necessary to renew the beds with fresh tan, and herein is danger of an excess of bottom heat. If tan remains too long in Pine beds, it decays into fine powder, becoming a harbour for worms. Opportunity may now be had to sift it, reserving the rough portion to mix with fresh tan from the yards. This will at first heat violently; in many instances the temperature of the bed will be as high as 120° Fahrenheit's thermometer—a sufficiently high medium to destroy the roots of the plants if they were plunged in it. It is generally best to place the pots on the surface of the bed, and at the end of ten days, or more, the heat will have declined, so that the pots may be plunged; 85° or 90° will be quite high enough for the roots. As it is desirable to make the plants throw-up fruit before they start into growth, this will be best accomplished by keeping them comparatively dry at the roots. Those which start into growth may throw-up fruit two months after the others, and some of them later still. A mode of treatment recommended by the best growers, and tried here with only moderate success, is to cut such defaulters over at the surface of the soil in the pot, repotting firmly in a 9 or 10-inch pot in the same way that suckers are managed. The earliest fruit from a batch of Queens started now would be ripe about the middle of June, but the night temperature should be 70°, except in very severe weather, when it may fall 5° lower.

*Cucumber House*.—Attend well to bearing plants. Now is the most trying period to obtain a supply. Much, indeed all, depends upon the variety, and the formation of the house. A true stock of Telegraph is a certain bearer in winter. The house should have a steep pitch and face south. There should be a sufficient quantity of hot-water pipes to raise the temperature to 65° or 70°, even in a severe frost, without overheating the pipes. Plants that have been in bearing for the last two or three months should have the surface mould removed without damaging the roots, and have a dressing of rich manure, mixed with turfy loam, applied to the surface. Glass and woodwork should be perfectly clean, decaying leaves be removed at once, thrips and green fly to have no place. Water when necessary with tepid water, giving a thorough soaking to reach the bottom roots.

*Melons*.—We made the first sowing on the 8th; Scarlet Gem and Hybrid Cashmere used to be our favourites. The last must certainly give place to Victory of Bath, a good selection of which has been brought into notice within the last few years by Mr. Gilbert, gardener to the Marquis of Exeter; and Read's Scarlet-fleshed Melon, a variety being sent out this year for the first time, will, if it maintain its character, displace all other scarlet-fleshed sorts. We are trying it against Scarlet Gem, and shall in due course state the results. It is best to sow the seeds in 5-inch pots in good loam, with a very small portion of leaf mould and sand, placing the pots in bottom heat, and as soon as the seed-leaves are fully developed the plants may be potted singly in the same sized pot, and they will make the dwarfest and most hardy plants if they are grown on shelves placed near the glass.

Removed a lot of *Sea-kale* and *Rhubarb* to the forcing houses, the *Sea-kale* treated as previously recommended. The *Rhubarb* roots are placed crowns uppermost in the bottom of flour-tubs, sufficient damp loam is placed round the roots so as not to quite cover the crowns, the tubs are placed in the early vinery or any forcing house, a covering of some sort is put over the tubs, and no water is applied to the roots until the first dish is gathered.

*Dwarf Kidney Beans* in a bearing condition in pots should be supplied with weak manure water, and freely syringed early in the forenoon. They must be kept free from red spider, and if this is done they will continue in bearing for a long period.

*Orchard House*.—The Peach and Nectarine trees have been

removed inside from the bed of cocoa-nut fibre refuse, in which they have been plunged out of doors since the first week of October. The young rootlets are ramifying freely into the surface loam which was added when the plants were repotted. Every plant of them was repotted when in full leaf in September, except the late sorts, which could not be potted until the fruit was gathered. Surface-dressing the pots is well enough if one could be sure the drainage was not defective, but if this is stopped from any cause surface-dressing will do harm instead of good. The trees are abundantly furnished with blossom buds, which are in a forward state. The house is aired freely by day, and shut-up closely at night. No frost is admitted. A fire is put on if the glass threatens to fall many degrees below the freezing point. We do not like the soil frozen in the Strawberry pots on shelves near the glass.

#### STOVE AND GREENHOUSE.

There are very few subjects in flower in the stove at present, except Orchids; but there are now so many handsome-leaved plants that the want of flowers is not so much felt; and there is in most places such a demand for cut flowers for drawing-room, dining-room, and other decorative purposes, that there is little chance to keep the houses gay. For instance, there are Orchid flowers which will continue in perfection for three months if left on the plant, but the gardener finds it necessary to cut them for the house, where their beauty is gone in a week. Of course gentlemen must take account of this when their hothouses show a paucity of flower. Still continue to keep a vigilant look-out for all insect pests. Amaryllis bulbs in one of the late vineries are starting into growth, and some of them are showing flower. They will be removed to a house where the night temperature is about 55°, and if the pots can be plunged in a gentle bottom heat the plants will grow much stronger. They have been kept without any water for more than two months. The mould in the pots will be thoroughly saturated at first; water will afterwards be applied as the pots require it.

The temperature in the greenhouse or conservatory must not fall too low now, as plants are being introduced from the forcing house. Some of them, if they receive a check at first, fail to open their flowers. Hyacinths, Lily of the Valley, or indeed nearly all flowering plants which have been brought to the flowering stage in heat, should be removed to the show house as soon as the first flowers open; they will not last long if allowed to open in heat. Care must be taken not to expose them to cutting winds from the side ventilators. The good old-fashioned *Fuchsia* is not very carefully cultivated in fashionable establishments now; but those who still appreciate this old favourite will at present be looking-up their old specimen plants which have been stowed away in a corner of some cool house where frost could not reach them. The pots ought to be quite dry, or at least sufficiently so that on pruning or cutting the old wood in pretty close to the main stems the cuts will not bleed. Leave the plants for a week or so after they are pruned, water the pots, and remove into heat afterwards.

Pruned the main collection of pot Roses. The buds were breaking freely all over the plants, which showed that root-action was healthy.—J. DOUGLAS.

#### TRADE CATALOGUES RECEIVED.

David Gold McKay, Sudbury, Suffolk.—*List of Vegetable and Flower Seeds.—List of Gladioli and other Flower Roots.*

James Betteridge, Common Hill Nursery, Chipping Norton.—*Abridged Catalogue of New and Choice Potatoes, and Hardy Herbaceous Perennials.*

Dick Radcliffe & Co., 129, High Holborn, London, W.C.—*Catalogue of Seeds, Garden Tools, Horticultural Decorations, &c.*

#### TO CORRESPONDENTS.

\* \* We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

CYCLOMEN (A. R.).—The flower is very slightly abnormal, and will not be permanent, we think.

STANDARD ROSES (W.).—We cannot recommend standard Roses for an exposed windy situation, as no Roses really can succeed as standards in such

a position, but twelve of the best and most hardy sorts are:—Alfred Colomb, Charles Lefebvre, John Hopper, General Jacquemont, Comtesse Ceille de Chabillant, Abel Grand, Dr. Andry, Boule de Neige, Baroness Rothschild, Victor Verdier, Fisher Holmes, and Maréchal Vaillant. We advise planting them as pillars on Muetts stocks, and carefully training them. No plants suffer more from wind than Roses.

WORMS IN POTTING SOIL (*An Inquirer*).—The portion of soil sent was found to be infested with four different kinds of worm-like animals of a white colour. Many were of a minute species of true worms. Several with very small black heads were the larvæ of a gnat, and others the larvæ of some of the Muscicædæ flies. Water the soil well with lime water, if the plants will bear lime.—L. O. W.

ELECTION OF ROSES (S. Eyre).—At the Rose election in the autumn of 1873, the following were the first twelve:—Charles Lefebvre, Maréchal Niel, Alfred Colomb, and Mar. Rothschild (equal votes), John Hopper, La France, Marie Baumann, Comtesse d'Oxford, Marquise de Castellane, Senteur Vaisso, Pierre Notting, and Duke of Edinburgh. At the election of new Roses last year the best twelve were:—Comtesse d'Oxford, Etienne Levet, Marquise de Castellane, Louis Van Houtte, Mlle. Eugénie Verdier, François Michelin, Ferdinand de Lesseps, Madame G. Schwartz, Catherine Mennet, Paul Neron, President Thiers, and Annie Lavton.

PRIMULA ATRICULA (*Inquirer*).—The species, native of Switzerland, has yellow flowers, and so have two of its varieties occurring there, *Primula Auriensis lutea* and *P. A. calycantha*. A third variety, also native of Switzerland, *P. A. integerrima*, has flowers of various colours. It is probable that all these ministered to the production of our garden varieties. As long ago as 1847 we published the following notes on this flower:—"The Auricula is described and figured by Gerard in his *Herbal*, which appeared in 1597, and it is there called the Bear's-eare or Mountain Cowslip. He says there were then many sorts, giving drawings of eight, the yellow, the purple, the scarlet, the bluish-coloured, and several reds. Like Baubin, he gives them the specific botanical name of *Auricula Urti*; but by Matthioli and others it was named *Saxicula alpina*, from its supposed healing virtues and mountain birthplace. It was often called by ladies the French Cowslip. It is very certain that they were then early much cultivated by French florists, for there is a poem in their praise, in a curious work published at Douay in 1616, entitled "*Jardin d'Hyver*," and with the verses are numerous drawings of the Auriculas, or "*Oreilles d'Ours*," as they are there called. Gesner named it *Lunaria anthratica* and *Paralytica alpina*. Parkinson says it obviously belonged to the Cowslip family, but Ludwig was the first to arrange it there under the generic name of *Primula*. Gerard says that the eight kinds he enumerates were then commonly grown in the gardens about London, but it is evident they were not much esteemed; nor is any notice taken of raising varieties from seed. This neglect soon passed away, for Johnson, in his edition of Gerard, published in 1633, says that there were then a very great many varieties of these flowers growing in the gardens of Mr. Tradescant and Mr. Uggie. Tradescant's garden was at Lambeth, and he, at the time Johnson wrote, was gardener to Charles I.

SANTOLINA INCANA (*Hyphfield*).—You must procure plants. Any of the nurserymen who make bedding plants a speciality can supply it, such as Cannell, of Woolwich, or Henderson, of St. John's Wood. Failing a full supply of it for this season, use *Cerastium tomentosum*, which forms an admirable substitute. To the query concerning the size of your garden, we answer, No.

RIBSTON PIPPIN (*Manchester*).—We do not consider grafting deteriorates this Apple. The parent tree at Ribston Hall, near Knaresborough, died long since, but young trees were raised from it. From the following account you will see that they are not so vigorous as was their parent:—"In the park once stood the original Ribston Pippin tree. This was raised from pips, sent home from Rouen in 1709 by Sir Harry Goodrick, Bart. The trunk of the original tree was blown down and removed many years ago; but a portion of it may now be seen outside the gardener's house, where it is taken great care of by Mr. Jones, the gardener. A sucker from the original tree now occupies the place of the latter. It does not grow well; indeed, owing to some of the branches dying off annually, it is now much less in size than when I first saw it some seventeen years ago. The branches have died off very much since the frost of December, 1869. It throws-up suckers freely, so that should the present tree be lost, one of them would soon make a nice tree with attention."—(*Florist and Pomologist*, 1868, page 245.)

SEEDLING PEACH TREE (*Mrs. M. S.*).—It will bear without being grafted or budded on another stock; but if budded on a bearing tree the growth from that bud would probably bear fruit earlier than the maiden tree. We had a maiden Peach tree trained as an espalier that bore when four years old.

PEAR TREES UNFRUITFUL (*I. R. P.*).—The state of your fruit trees cannot be accounted for in any other way than the soil being unsuitable, or your garden not being efficiently drained. If the drainage is good lift the trees carefully at once (it would have been better to have done so in November), trench the ground at least 2 feet deep, and replant, placing decayed turfy loam or some good soil round the roots.

DEAD ANIMALS FOR VINES (*Idem*).—The reason why fresh animal matter is not applied to Vine borders is, that any roots coming in contact with the carcass would be killed. One or two buried in a border or at the roots of fruit trees would not do any appreciable harm; and in the course of years, when the organic matter had returned to its original dust, the roots would derive sustenance from it. The Vine borders at Italy Castle many years ago were made with a large quantity of animal matter intermixed, and the Vines refused to grow. Tretham Black Grape succeeds well in a ground viney, but we would not plant Gros Colman in such a structure.

HORSE CHESTNUT GRAFTING (*C. E.*).—We think your previous failure was due to the manner of putting on the grafts, which was probably the ordinary crown method. We advise you to proceed as before, and to graft on the side instead of the strong main branches by the mode known as tongue or whip-grafting. Leave a foot or so of the main branches beyond the smaller branches on which you insert the grafts, and after the latter have taken cut this away close to the smaller branches on which the grafts are situated. A better plan would be to allow one or two strong shoots to start from each, and had these as soon as the buds at the points of the shoots were formed, or after the middle of July, taking a good bud from the second or third joint with its leaf, and reducing it about one-half. The buds succeed better than grafts.

PLANTS FOR BACK WALL OF GREENHOUSE (*A. F. N.*).—Your wall being shaded by a Vine on the roof will only suit plants that require shade from bright sun in summer, and those most suitable are Camellias. The Cape Jasmine will not suit. *Luethia gratisina* would answer, and is winter-flowering and sweet-scented. *Hibothamnus fasciculatus* and *H. elegans* flower

in winter or early in spring, and are suitable; but the most satisfactory subjects would be Camellias, than which no flowers are finer. March, scarlet; Mathotiana alba, white; and Rubens, deep rose, are suitable varieties.

**ANNUALS TO FLOWER IN SPRING (B.).**—To flower at the end of March or beginning of April the seed ought to have been sown in pots during October, and wintered in a light airy position in the greenhouse. It is now when they may flower in April or May. *Asperula azurea setosa*, *Clandrinia nubellata*, *Campaulia pentagona*, *Collinsia verna*, *Eucharitium grandiflorum*, *Gypsophila muralis*, *Leptosiphon densiflorus*, *Lomanthos grandiflora*, *Limnium grandiflorum coccineum*, *Nemophila insignis*, *N. atomaria*, *Silene pendula ruberrima*, and *Whitlavia grandiflora*.

**HEATING A GREENHOUSE (Yorkshire).**—Your house being of only moderate dimensions, and your not being able to attend to it for several hours, it would be best to heat it by gas—that is, if you can command it with certainty. One of the hot-water stoves with pipes would answer well. The *Zuczag* Gas Boiler, which you will see advertised, is probably the best of that description; or if you have not gas at command, a Pearl's International or Pearl's Slow-combustion Boiler would suit you; but for prices, &c., write to the manufacturers, stating what you require, and asking for an estimate of complete material for efficiently heating the house.

**STABLE DUNG WITH SAWDUST FOR HORSEBOES (E. F. C.).**—We have experience of this, as we have it to use from horses standing on sawdust in loose boxes. It answers well, but does not require to be so deep as when dung with its litter is used. A bed about 3 feet high will give you sufficient heat, but it needs to be moist, and has only two faults—viz., it heats violently, and so is apt to become dry, and therefore cold. Could you not get some leaves or spent litter to mix with it? We use it in about equal proportions, and it then answers admirably, giving a lasting heat.

**PARAFFIN OIL FOR THIRPS ON VINES (Subscriber).**—After stripping off the loose bark from the stems of the Vines, taking care not to damage the living bark and eyes, you may dress them with paraffin oil mixed with an equal quantity of water, and if you have nearly bag or scale it may be applied in its pure state. Used whilst the eyes are dormant, the paraffin will not injure the Vines, but if it drip or fall on the Pine Apple leaves it may cause them to spot; it ought, therefore, to be used some time before the Vines are introduced into the house.

**MANCHING LAWN (F. E. T.).**—The only thing we can advise you to do, as you have no rotten manure, is to procure some good compost from your rubbish-heap, or all kinds of vegetable refuse from a heap that has been turned over a few times until reduced to mould. This put on in March would improve your lawn immensely, raking it well in with an iron rake, sowing some Seckling Clover on it at the rate of 12 lbs. to the acre, and rolling well. We could not tell you where to procure the compost; probably you might, as a favour, obtain it of some farmer in your locality, or he might allow you the requisite quantity of well-rotted manure. Twenty loads of compost, or twelve loads or tons of well-decomposed manure, are a good dressing for an acre.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### DEVIZES POULTRY SHOW.

The third annual Exhibition took place on the 6th and 7th inst., closing unfortunately with the Portsmouth Show. Though lacking quantity, in quality many classes were very good. The Corn Market is a first-rate place for an exhibition, having the light equally distributed, so that the birds can be well examined. For such liberal prizes the entries in several classes were very small. This Exhibition ought to be better supported by exhibitors and the public.

**Dorkings.**—Few in numbers, but eight entries in the first class, which contained Coloured, excluding Silver-Grey. First large and heavy dark-coloured birds, worthy their position, but we should fancy pressed rather hardly for the cup by the first-prize Whites. Second-prize poor birds. Third Rose-combed chickens—very promising. Mr. E. Hooper v.n.c.; very large, but appeared out of condition. No. 5, c.; why, we could not understand.

**Class 2.**—Dorkings (Any other variety). Five entries.—First a grand pen, as we have remarked; we fancied they ran the cup pen closely for premier honours. Second Silver-Grey; large, good-bodied birds, but silver not sufficiently distinct. Third chickens (Whites) of good colour; cock's tail somewhat too squirrel-fashion. 3, n.c.; very coarse comb.

**Class 3.**—Cochins (Cinnamon and Buff). Six entries.—First-prize and cup a most splendid-coloured bird, the colour being good down to the very hook—below this we did not like him so well; feathering but poor, and the hen not a worthy companion. Second very meanly-winged. Third very good pen, although perhaps rather too hooked; the feathering was the best in the class, and we should have placed this pen second. Pen 16, Miss Milward's, contained a very good hen.

**Class 4.**—Cochins (Partridge). Six entries.—The leg-feathering in the class generally was weak. First-prize, if we do not err, the hen's tail was twisted; it certainly was so for some time while we examined her. Second-prize—cock leggy, and deficient in feather to our taste. No. 22, n.c.; cock had a twisted comb.

**Class 5.**—Cochins (White). Nine entries.—The Whites at any rate asserted their full right to a class by having half as many entries again as the two other classes of Cochins. First-prize good-coloured birds, and the hen we liked much, but we cannot say as much for the cock, especially in the comb, which went far back—so far back as to twist to one side and lie flat on the

back of the head; it struck us as a great defect. Second-prize a very good pen; we preferred it to the first, and should have so placed them ourselves. 32, n.c.; good-bodied birds. 26, c.; yellowish. 27, c.; good, but too small. The feathering in this class was the best of the Cochins.

**Class 6.**—Brahmas (Dark). Seventeen entries.—Here again our ideas would have placed the second-prize first. The first-and-cup cock's comb was coarse and rather confused, and the secondaries not to our liking as to carriage; this was also somewhat noticeable in the second-prize pen, but in colour, leg-feathering, and comb we thought it superior to the cup. The hen, too, was a beauty. Third-prize good, but strawy in colour; hen's wings not to our taste as to carriage. Pen 37, c.; cock's tail very much awry. 44, c.; why, we could not imagine.

**Class 7.**—Brahmas (Light). Twenty-seven entries.—The class for numbers in the whole Exhibition, and the best birds close together. Many of the combs in this class were confused and irregular, and nothing adds much more to the beauty of these two classes than a small, neat, regular comb. First-and-cup, comb coarse, hackle-marking very good. Second same fault in comb, good colour, and good hackle, but the hen out of condition, small, and all of a heap. Third, very large good-bodied pen, but not sufficient leg feathering to our taste. We think the judging here was difficult, and the birds near together. Some would have placed third in the place of honour. 71, v.n.c., good well-feathered birds, but far too much white in the cock's tail. 74, n.c., yellowish-coloured cock, but for shape we thought him best in the class. The Light birds have greatly improved, still the leg-feathering is poor as compared with their darker brethren, and the combs are more generally faulty.

**Spanish.** Six entries.—First and cup cock good quality, but must have yielded the pride of place to No. 2 had not the face of the latter been scabby and discoloured. This disfigurement was a sad pity, as the amount of earlobe and its quality where not discoloured was remarkable. The other noticed birds were very good, but it is sad to see such a poverty of entries.

**Class 9.**—Game cocks (Black-breasted and other Reds). Eighteen entries.—First-and-cup Brown Red, good shape and colour, but though an old bird, apparently raw, standing badly, and not showing himself to advantage; for this reason we fancy we should have given the cup to the first-prize Duckwing, also belonging to the same owner. Second-prize a Black Red, which we should have thought too large. Third a close-feathered bird, of good style.

**Game hen (Reds).** Thirteen entries.—Cup a good close hen, but to our fancy No. 112 was vastly her superior. This was a grand bird, unnoticed; we should consider it an oversight. Here again, as in the Duckwing hens, the carriage of the wings was not close enough for our notions.

**Class 11.**—Game cock (Any other variety). Eight entries.—First a very grand bird; as we have already said, we fancied the cup should have rested here. Second a very good Pile.

**Class 12.**—Hens. Nine entries.—All Duckwing but one, several very good birds. 122, n.c., very red on breast, and very loose in wing secondaries.

**Class 13.**—Pencilled Hamburgs. Nine entries.—First Gold, second Silver; we liked the second best, but both belonged to Mr. Beldon; they were both very good. Pen 134, n.c., immense earlobes—far too large and coarse for our taste; indeed, we fancied many of the Hamburgs showed a tendency this way.

**Class 14.**—Spangled Hamburgs. Fourteen entries.—First-and-cup cock a very good bird; hen out of condition, earlobe stained, and feathers not lying smooth. Second also good; both these pens were Golden. Pen 116, n.c., hen, very crooked back. 152, c., Silver, a glorious tail, deficient in bar and wing markings, but we think this cock will much improve.

**Class 15.**—Black Hamburgs. Ten entries.—First-prize very small, and particularly neat and close birds of true Hamburg shape; we liked them much.

**Class 16.**—Polands. Eight entries.—A very good class, save one unnoticed pen, which spoiled the beauty of the class, and might with almost equal propriety have been entered in one of the Hamburg classes. First Golden; hen very poor, cock not the grandest. Second Silver, a good hen, topknot very large, but bad in shape. Third White-crested Black hen, a miserably small crest. Pen 169, v.n.c., we liked much better than third-prize; they also were Blacks. 170, n.c., a grand-crested cock, the crest being remarkably fine in quality, and the colour and marking of the bird very good, the hen perhaps scarcely his equal; but we should have placed this pen first. If different colours must take the other prizes, we would have given the second to pen 169, although the cock's crest was pecked out, and third to the Golden. The Silvers generally were far superior birds to the other varieties. This class was one of the gems of the Show, every pen, except the nondescript before mentioned, being noticed.

**Class 17.**—Houdans. Seventeen entries.—This and the next class were very good—especially so. First-prize very large, in beautiful plumage, but having straw-coloured saddle feathers.

**Class 18.**—French (Any other variety). Eleven entries.

—Several very grand birds, especially the Crêves, which took first and second, the third prize going to La Flèche, of which there were three pens.

Class 19.—*Malays*. Ten entries.—Again did the Malay-breeders prove that, with fair treatment, they can muster respectably at Devizes—better far than many classes to which silver cups were offered. Here, again, we disagreed with the judging, and would have placed the three prize pens differently—thus, first the second-prize pen, the cock being a grand-coloured bird, but having a whitish feather in his tail, and the neck hackle too loose; second the third-prize pen, the cockerel, though small, being brilliant in plumage; third the first-prize bird. The cockerel in this pen may improve; he was superior to the second-prize pen in neck only; he had far too much brown in the breast. Pen 205, good pen, but inclined to white in tail.

Class 20.—Any other variety. Twelve entries.—Second badly-feathered Black Cochins; third a good pen of Minorcas. 217, c.; we do not fancy them (Plymouth Rocks). Pen 216 a very good pen of Sultans, too dirty to obtain notice; white fowl should be white.

Class 21.—Game Bantams (Red). Fifteen entries.—We liked the winning pens.

Class 22.—Game Bantams (Any other variety). Ten entries.—First a little beauty, Duckwings; second Piles, third Duckwings; pen 238, h.c., good Duckwings. This was a good class.

Class 23.—Bantams (Gold or Silver-laced).—First best colour, but lacing very indifferent (Golden); second Silver, tail splashed. Pen 219 unnoticed, colour bad silver-gilt, but lacing exquisite; we should have placed this first.

Class 24.—Eight entries.—Second-prize, we think it was Black Japanese, found his tail far too much for his convenience.

Class 25.—Aylesbury Ducks. Four entries only!—Quality made up for quantity. When Mr. J. K. Fowler has to be content with third, winners ought to be good, and so they were. We fancied the second-prize pen looked the heavier; both were grand specimens. The cup pen was claimed.

Class 26.—Rouen. Fourteen entries.—Here, again, were some magnificent birds.

Class 27.—Black East Indian. Twelve entries.—A perfect show in themselves, eight out of the eleven that put in an appearance being noticed. Mr. G. S. Sainsbury was deservedly first, taking the cup with a wonderfully compact pair, so equal that it was hard to say which was the better bird—it was always the bird you were looking at—both wondrously small and compact, and lustre all that could be desired. Third-prize largest in comparison. Pen 257, v.h.c., very good in lustre, but large compared to the cup pen. This was a beautiful class.

Class 28.—Ducks (Any other variety). Five entries.—The Mandarins and Carolinas little pictures.

Class 29.—Selling Class. Thirty-one entries.—Some very good birds. First-prize Dark Brahmas cheap at double the amount.

*Pigeons* a very limited supply, some of the classes having no entry, and two or three others only a single pen! We thought the Turbits the best class.

The catalogue had the pens of unsent birds marked "empty," and the varieties somewhat better marked than usual, but in the Variety class many pens were undistinguished; in the Polish all were, and a few of the Hamburgs. If the certificates of entry are not properly filled-up in these particulars we think they should be returned. Many of the specimens were sent off the night of the second day, and so far as we could see, the management was careful. We think all the crested birds should have water outside, not inside the pens. The awards and names of the Judges were published last week.

## PORTSMOUTH POULTRY SHOW.

The sixth annual Exhibition, consisting of poultry, Pigeons, Pheasants, Cage Birds, Rabbits, and Cats, was held at the Drill Hall on the 6th, 7th, and 8th inst. The arrangements were good, except in respect to the delay in fixing the prize cards on the pens; and we would advise the Committee to give some care to this in future, as at this period of the year, when a show opens at one o'clock, there is hardly time to make a complete examination by daylight, and a delay in marking the winners is very vexatious. The numbering might also be conducted on some better principle, as we found it very difficult to follow some of the classes.

In the *Game* classes the Black Reds were numerous, but not very good; the Brown Red class was much better. The winner of the first prize, which also obtained the cup over the other *Game* classes, was a very superior bird, and we have little doubt he will, if exhibited, bring his owner many more prizes. The second-prize bird was a good one, but had lost a sickle feather. The Any variety *Game* were not better than the Black Reds. The first prize went to a tolerably good pair of Duckwings, the second to Piles—the cock a very neat bird, the hen quite unworthy of him, and the third to Duckwings—the cock very hook-beaked, but we could not find a better.

The Buff *Cochins* were a moderate lot. The first and second-prize pens were tolerably good; in the third the cock was small, and his partner striped in the hackle; we liked a highly-commended pen better. The Any variety *Cochins* were much superior, Mr. Shrimpton again winning with Partridge, an exquisite pair of Whites being second.

The Dark *Brahmas*, with a few exceptions, were not good. The first-prize cock was large, but not equal in colour to some of the others; the hen we also thought very brown, but they were in a bad light. The second-prize birds were better in colour, but not so large. Pen 78, highly commended, we liked better than either; the cock had a good black breast, and the pullet was most evenly pencilled, and superior, we thought, to everything in the class. Mr. Lewis Wright also exhibited a good cock, superb in colour, with a very pretty comb; when more developed, and if shown with a better partner, he will be sure to take a leading position. The Light *Brahmas* were divided into five classes; the result was a few good pens and a great many pens of rubbish, many exhibitors, no doubt, thinking that in such a scramble probably they might find a weak place, and possibly get a prize; in some instances they were not disappointed. In the cockerel class Mr. Dean won with a very pretty bird, good in colour, shape, and well feathered, but the comb showed a disposition to turn, which will probably in time spoil him for exhibition. In the pullet class the competition was very close; the first-prize pen was the largest, the second best in colour. The class for old cocks we did not admire; the first-prize bird was very yellow, the second good in colour, but narrow, and very ugly in the comb. In the class for hens the winners were a grand pair, shown in beautiful condition; the second pen was a moderate one; the third very poor; they were entered at £3 3s, but we did not think them a bargain.

The *Dorking* class was the best in the Show. The first-prize cock was an old bird, in splendid condition; the second a very promising cockerel, belonging to the same owner; and the third-prize pen contained a very fine hen that well deserves notice. Many high commendations were distributed in this class, and they were well deserved.

The *Spanish* class was good. The first-prize pullet was a fine specimen; the cock we did not like so well, we thought him narrow in the face, and insignificant when compared with the pullet. The second and third-prize pens contained nice birds. A class for Andalusians followed, which we were pleased to see obtained eight entries. We hope this will encourage the committees of other shows to make classes for this very handsome and useful variety.

The *Hamburg* classes were well filled. The *Polish* contained some very handsome birds, and the *French* were equally good.

The *Bantams* we did not consider good. In the Black Reds Mr. Adams exhibited a pretty pen, good in colour; but the best cock was shown with a wretched hen, and consequently passed over. In Brown Reds the first-prize hen was remarkably fine. The Black Bantam class was very interesting, and some remarkably good specimens were to be found. Here we would advise one or two exhibitors to be more sparing with their oil; a little may improve the comb, but it looks very bad on the earlobe.

The *Ducks*, *Geese*, and *Turkeys* were not large classes, but a few fine specimens were to be found.

A good collection of *Pigeons* followed. The *Pouter* class contained one or two fine birds. The class for *Barbs* had but four entries, all good birds. *Carriers* came next; the first-prize hen was remarkably good. The *Dragon* class was well supported, a good pair of *Yellows*, sound in colour, being first. In *Tumblers* all the prizes went to *Almonds*. The *Fantails* and *Jacobins* were good; the latter class must have given the Judge some trouble, the competition being very close. A pair of *Whites* were first, a pair of *Yellows* second, and pair of *Reds* third.

The *Rabbit* classes contained some fine specimens, but they were not so well supported as they deserved to be.

*GAME* (Black-breasted Red).—1, Pope. 2, Elliott. 3, W. Lovering. St. Austell. *h.c.* F. Warde, West Farleigh; J. Forsyth, Wolverhampton; M. Sandford, Martin, Dover.

*GAME* (Brown-breasted Red).—Cup, F. Warde. 2, S. Matthew, Stowmarket. 3, E. Winwood, Worcester. *h.c.* H. Browne, Putney Heath.

*GAME* (Any other variety).—1, D. W. Thomas, Fitcham. 2, W. Foster, Deal. 3, G. and Rev. F. Dutton, Windrush Vicarage. *h.c.* S. Matthew. *c.* Pope. *Cochins* (Buff and Cinnamon).—1, H. Hays. 2, Henry Lingwood, Needham Market. 3, Dr. Bullmore, Falmouth. *h.c.* J. Bloodworth, Cheltenham. *c.* G. Shrimpton, Leighton Buzzard.

*COCHINS* (Any other variety).—Cup, G. Shrimpton. 2, R. W. Beachey, Fluders, Kingskerswell. 3, Capt. Colridge. *h.c.* N. P. Davies, Islesworth. *c.* G. Lias, Par Station; J. Sleep, Kingsland, London.

*BRAHMA POOTRA* (Dark).—1, H. W. Castle, Kensington, London. 2, T. H. Wychman, Anderton, Devonport. 3, Rev. J. D. Peake, Litcham Vicarage. *h.c.* B. Hill, Southsea; G. Collins, Southwick, Hants; H. W. Reville, Fulham Road; Horace Lingwood, Creeting; L. Wright, Crouch End, Hornsey. *c.* J. Harvey, jun.

*BRAHMA POOTRA* (Light).—Cockerel.—1, T. A. Dean, Marden, Hereford. 2, J. Chisham, Rowhams, Southampton. 3, H. Maynard, Holmewood, Ryde, Isle of Wight. *h.c.* H. Hoare, Bitterne; H. Maynard; F. Crook, Forest Hill.

*BRAHMA POOTRA* (Light).—Pullet.—1, T. A. Dean. 2, Mrs. Williamson, Leicester. 3, J. Long, Bromley. *h.c.* P. Haines, Falmouth, Dss; T. A. Dean. 4, Bird, Fulham. *c.* J. Bradshaw, Knowle Cranleigh, Guildford; Horace Lingwood; F. Crook.

*BRAHMA POOTRA* (Dark).—Cock.—1 and 3, Mrs. Williamson. 2, J. Bloodworth. *h.c.* P. Haines; Mrs. Willsher, Guildford; — Maynard. *c.* J. Bradshaw. R. Bird; Miss C. M. Davies, Islesworth.

**BRAMA POOTRA** (Light).—Hens.—1, Mrs. Williamson. 2, Mrs. T. Turner, Ayr. 3, J. Chisham.  
**BRAMA POOTRA** (Light).—1, J. Bradshaw. 2, Mrs. T. Turner. 3, Mrs. Popham, Stourfield, Churchchurch. *hc*, H. M. Maynard. *c*, — Paros.  
**DORKINGS**.—1, Cup, and 2, T. C. Bunnell, Stratton, Micheldover. 3, Lieut. Col. Lane, Bracknell. *hc*, F. Caws, Little Fleetwood, Southampton. 4, J. H. Putney, Dorking. 5, Moore, Petersfield (2). — Lingwood, Lieut. Col. Lane.  
**SPANISH**.—1, E. James, Peckham Rye. 2, H. Brown, 3, Nichols Bros., Camberwell. 4, Mr. J. E. Simpson, Budd's Ball, Worcester. 5, Nichols Bros., Camberwell.  
**ANDALUSIANS**.—1, W. Willey. 2, T. Moore, Landport. 3, Mrs. D. Bentley, Netley. *hc*, W. Willey. 2, Moore. *c*, Mrs. Bentley. 2, Moore.  
**HAMBURGERS** (Gold-pencilled).—1 and 3, T. Faulkner, jun., Merston, Isle of Wight. 2, G. J. Lenay, Lewes. *hc*, T. Faulkner, jun.; T. Edwards, jun., Totnes.  
**HAMBURGERS** (Silver-pencilled).—1, N. Barber, Plymouth. 2, Master E. Moore. 3, T. Faulkner, jun.  
**HAMBURGERS** (Gold or Silver-spangled).—1, N. Barber. 2, C. Browne, Maidstone. 3, Miss Palmer.  
**POLANDS**.—1, J. Hinton, Warminster. 2, T. Edwards, Lyndhurst. 3, Capt. Coleridge, Wargrave. *hc*, — Reeves; T. Edwards; D. Mutton, Brighton (2).  
**FRENCH**.—1, — Dring, Faversham. 2, H. Feast, Swansea. 3, Rev. N. J. Ridley, Hollington House, Newbury. *hc*, Miss A. R. Greene, Wyckham.  
**ANY OTHER VARIETY**.—1, J. Hinton (Malays). 2, S. P. Bond, Reigate (White Silkie). 3, S. B. Perry, Lynton (Malays). *hc*, R. S. S. Woodgate, Pombury, Cambridge Wells; Capt. Terry, Reading (White Malays); A. Ward, Wimpole Street, London (Leghorns). *c*, Rev. F. G. Hodson, North Petherton (Malays); — Bishop, Fareham (Guinea Fowls).  
**GAME BANTAMS** (Black Red).—1, W. Adams, St. Clements, Ipswich. 2, — Wingfield. 3, F. James. *hc*, W. S. Marsh, Winkland Oaks, Deal (2); C. J. Spary, Ventnor; R. Donger, jun., Parkstone, Poole; F. Southwood, Fakenham.  
**GAME BANTAMS** (Brown Red).—1, S. Bell, Farnfield. 2, W. Adams. 3, J. Long, Bromley. *hc*, W. S. Marsh; W. Currah, Tywardreath, Far Station; J. Walsh, Forest Hill.  
**BANTAMS** (Black).—1, W. H. Shackleton, Bradford. 2, R. H. Ashton, Mottram. 3, — Wingfield, Worcester. *hc*, T. E. Thirle, Lowestoft; H. M. Maynard. *c*, A. M. Pigott, Bramford Spike; J. Body, Lloyd's Green, Wiltshire.  
**BANTAMS** (Any other variety).—1, Master M. V. Sandford, Martin, Dover. 2, — Wingfield. 3, Rev. F. G. Hodson. *hc*, A. Webb, Lynton; T. C. Butler; R. S. S. Woodgate. 4, Mrs. Markyate Street; J. Body, Bloxworth; Rev. G. S. Cruwys, Cruwys Morchard, Tiverton. *c*, A. M. Pigott; W. S. Marsh; — Fielder; Rev. G. S. Cruwys.  
**DUCKS** (Aylesbury).—1, S. R. Harris, Cusgarne, St. Day. 2, H. Hoare. *c*, A. J. Woodward, Fareham; H. Hoare.  
**DUCKS** (Rouge).—1, Rev. F. G. Hodson. 2, J. Harvey, jun. *hc*, H. Dowsett, Chelmsford; P. Ogilvie, Hambleton (2). *c*, Miss H. M. Davies.  
**CHICKENFISH** (Any variety).—1, J. W. Kellway, Merston, Isle of Wight. 2, R. Wilkinson, Guildford. *hc*, I. W. Kellway. 3, M. Leno. *c*, Rev. F. J. Stockdale, Haverthorpe Vicarage, Isle of Wight.  
**GESE**.—1, A. J. Reed, Portsea. 2, Master N. P. Davies. *hc*, Mrs. A. Webb; — Parrott.  
**TURKEYS**.—1, Rev. N. J. Ridley. 2, P. Warde.  
**SELLING CLASS**.—1, Capt. Warren, Emsworth (Light Brahma). 2, H. Brown (Spanish). 3, Mrs. Dressing, Hawkthorn, Farnham (Japanese Silkies). *hc*, Mrs. T. Turner (Light Brahma); Rev. J. P. Bartlett, Exbury Rectory (Light Brahma); — Willey (Andalusians) (2). *c*, — Chisman (Rose-comb Dorkings); W. Boots, Landport (Dorking and Buff Cochins).  
**SELLING CLASS**.—*Cock or Cockerel*.—1, B. Hill (Dark Brahma). 2, R. W. Deaichey (White Cochins). 3, S. Martin, Fratton (Dark Brahma). *hc*, R. Crabbe, Fratton (Dark Brahma); H. Brown (Spanish); W. Willey (Andalusian); — Moore (Andalusian). *c*, Mrs. J. O. March, Elmfield (Buff Cochins); J. Chisham (Dark Brahma); — Willey (Buff Cochins); H. M. Maynard (Light Brahma).  
**SELLING CLASS**.—*Hens or Pullets*.—1, — Beachey (White Cochins). 2, Capt. Warren (Light Brahma). 3, — Wyllie (Silky Pullets). *hc*, J. Smith, Clapham Junction (Dorkings); — Crabb (Dark Brahma). *c*, H. M. Maynard (Light Brahma); — Fit, Fareham (Andalusians).  
**PHEASANTS**.—1, J. T. Turner. 2, J. Body.

## PIGEONS.

**PATERS**.—1 and 2, Mrs. Ladd, Calne. 3, H. Steed, Tunbridge Wells.  
**RABBS**.—1, 2 and 3, H. M. Maynard. *hc*, P. H. Jones, Fulham.  
**CARRIERS**.—*Cock*.—1 and 2, H. M. Maynard. Extra, H. Jacobs, Sandown, Isle of Wight (2). *hc*, F. Goss, Plymouth. *hc*, W. Quickfall, Shanklin (2). *hc*, — J. H. Ivimey, Ellisfield, Basingstoke. 2, H. M. Maynard. *hc*, W. Quickfall (2); H. M. Maynard. *hc*, W. Quickfall.  
**DRAGONS**.—1, P. H. Jones. 2, T. Donger, jun. 3, H. Jacobs. *hc*, W. Lane, Hereford.  
**TUMBLERS**.—1, 2 and 3, J. Ford, Monkwell Street, London. *hc*, P. H. Jones.  
**FANTAILS**.—1 and 3, H. M. Maynard. 2, J. F. Loversidge, Newark. *hc*, A. A. Vander Meersch, Tooting.  
**JACOBS**.—1, A. A. Vander Meersch. 3, P. H. Jones.  
**ANTWERPS**.—1, C. Copeman, Farningham. 2 and 3, E. F. Wilson, Brighton. *hc*, W. Tombs, Oxford; G. J. Lenny.  
**ANY OTHER VARIETY**.—1 and 2, P. H. Jones (Foreign Owls and Archangels). 3, Miss F. I. Davies, Isleworth. *hc*, G. Holloway, jun., Strand (Pigmy Pouters). — Tomlinson, Ryde, Isle of Wight (Sushans); E. S. C. Gibson, Ryde, Isle of Wight (Austrian Pigeons); H. Gibson, Brockenhurst (Red Indians and Grey Owls); A. A. Vander Meersch (2); O. Nicholson, Portsmouth (Silver Runt).  
**SELLING CLASS**.—1, J. Ford (Tumblers). 2, H. M. Maynard (Black Carriers). 3, J. Walker, Burslem (Black Carriers). *hc*, H. Jacobs (White Dragons); — Cork; J. D. Blackman, Southampton (Dum Carriers).

## CANARIES.

**NORWICH** (Clear Yellow).—1 and 2, Bemrose & Orme, Derby. *hc*, W. Inson, Clifton. *hc*, B. B. Newson, Bromley, Kent. *c*, R. B. Newson. — Walter.  
**NORWICH** (Clear Buff).—1 and 2, Bemrose & Orme. *hc*, W. Inson; Athersuch & Son, Coventry; W. Walter, Winchester. *hc*, C. Davis, Landport; W. Walter. *c*, Athersuch & Son.  
**NORWICH** (Evenly-marked or Yellow Variegated).—1 and 2, Bemrose & Orme.  
**NORWICH** (Evenly-marked or Buff Variegated).—1 and 2, Bemrose & Orme. *hc*, B. B. Newson; Athersuch & Son. *hc*, Athersuch & Son.  
**BELOAN** (Clear Yellow).—1 and 2, Bemrose & Orme. *hc*, C. Davis. *hc*, J. W. Savage, Guildford. *hc*, H. Gibbs, South Brent; P. Ogilvie.  
**BELOAN** (Clear Buff).—1, T. Moore. 2, C. Davis. *hc*, H. Gibbs; C. Davis. *hc*, H. Gibbs; P. Ogilvie.  
**BELOAN** (Evenly-marked or Yellow Variegated).—1, T. Moore. 2, H. Gibbs.  
**BELOAN** (Evenly-marked or Buff Variegated).—1, O. Nicholson. 2, H. Gibbs.  
**LIZARDS** (Gold or Silver-spangled).—1, Rev. V. Ward. 2 and 3, Athersuch & Son.  
**ANY OTHER VARIETY**.—1, Bemrose & Orme (Jonque Cinnamon). 2, — Willscher (Cinnamon Norwich). *hc*, H. Gibbs (Crested Norwich); — Newson (Cinnamon). *hc*, C. Knight, Arlesley, Baldock (Yorkshire and Belgian); — Newson (Crested Norwich); R. King, Souths (a Cape Canary).  
**MULES**.—1, J. Brown, jun., Penrith (Goldfinch). 2, — Willscher (Yellow Goldfinch). 3, Bemrose & Orme. *hc*, Rev. J. P. Bartlett, Exbury Rectory (Siskin); — Willscher (Goldfinch); — Walter; J. Brown, jun. (Linnets). *hc*, Rev. V. Ward, Hyde (Goldfinch); R. E. Wade, Bognor (Linnets). *c*, W. Gibling, Southsea (Goldfinch).  
**BRITISH AND FOREIGN BIRDS.**  
**BULLFINCHES**.—1, — Willscher, Chichester. 2, W. Walter. *hc*, C. Knight. *hc*, O. Nicholson, Portsmouth.  
**GOLDFINCH**.—1, W. Barnes, Portsea. 2, C. Knight. *hc*, C. Knight; T. Willscher. *c*, O. Nicholson. *hc*, E. F. Marvin, Southsea; O. Nicholson.

**SKYLARK**.—1, W. Walter. 2, — Simmons, Portsea. *hc*, — Barnes; G. Nicholson.

**SISKIN, REDPOLE, OR LINNET**.—1 and *hc*, W. Barnes. 2, T. Willscher.  
**BLACKBIRD OR THRUSH**.—1, O. Nicholson. 2, B. Hill. *hc*, D. Carver.  
**BRITISH BIRDS** (Any other variety).—1, J. T. Turner (Raven). 2, W. Boots (Starling). *hc*, J. T. Turner (Buzard); W. Boots (Magpie). *hc*, Miss Baruca (Cock Robin).

**GROUP OF BRITISH BIRDS IN ONE CAGE** (Consisting of not less than eight distinct varieties of Finches, Buntings, Warblers, &c.).—1, W. Barnes. 2, T. Willscher. 3, W. Walter. *hc*, Rev. J. P. Bartlett; Dr. W. Case, Fareham; H. E. Wade.

**FOREIGN BIRDS** (Any variety).—1, — Nicholson (Lories). 2 and 4, W. Walter (Love Birds and Australian). 3, — Barnes (Spice Birds). *hc*, Sgt. S. Burgess, Southsea (Love Birds); — Lewis (King Parrot); W. Walter (King Parrot and Grass Parrots); — Barnes (St. Helena Waxbills). *hc*, Rev. J. Bartlett (Pin-tailed Wydah); W. Walter (Pin-tailed Wydah and Madagascar Finch); — Nicholson (Rosella and Cockatoo).

**SELLING CLASS**.—1, 2, and *hc*, — Nicholson (Ring-necked Parakeets, Cardinal, Avadavats, and Goldfinch). 3, Rev. J. P. Bartlett (Budgerigars). *hc*, W. Walter (Parakeets and Spice Birds); — Nicholson (Budgerigar and Goldfinch). *c*, W. Walter (Love Birds).

## RABBITS.

**LENGTH OF EAR**.—1 and 2, F. Banks, Doughty Street, London. *hc*, T. Buckland, Oxford; C. King, St. John's Wood.

**BLACK-AND-WHITE, AND BLUE-AND-WHITE**.—1 and 2, F. Banks. *hc*, — Hume. *hc*, F. Loveband, North Street, London, N.W.

**GREY-AND-WHITE, AND YELLOW-AND-WHITE**.—1, C. King. 2, F. Loveband. *hc*, C. Arthur, Melksham.

**TORTOISESHELL**.—1 and 2, F. Banks. *hc*, C. King.

**SELF-COLOUR**.—1, F. Banks. 2, F. Loveband. *hc*, F. Banks; Smith and Simmons, Portsea. *hc*, — Ellis.

**FOREIGN** (Any variety).—1, — Arthur (Angora). 2, G. P. & R. Hackett, Haverstock Hill. *hc*, Mrs. R. Coward, Dulwich (White Angora). 3, R. C. Coward, Dulwich (Bimalaya); E. S. C. Gibson. *hc*, A. J. Woodward (Silver-Grey); — Ellis (Silver-Grey); — Anns (Chinchilla); — Arthur (Angora). *c*, Mrs. R. Coward (White Angora); A. J. Woodward (Angora); E. S. C. Gibson (Silver-Grey); G. P. & R. Hackett (Silver-Grey).

**FOR WEIGHT, THE HEAVIEST REGARDLESS OF BREED**.—1, J. N. Harrison, Belper. 2, A. J. Woodward.

**SELLING CLASS**.—1, Smith & Simmons. 2, F. Banks. *hc*, C. King (Black Lop); Smith & Simmons; Mrs. Dressing (Himalayan). *hc*, E. S. C. Gibson.

## CATS.

**TORTOISESHELL, OR TORTOISESHELL-AND-WHITE**.—1, H. Strofton, Streatham. 2, Mrs. Lamb. *c*, T. Twoas, Portsea.

**TABBY**.—1, Nichols Bros. 2, G. Ellis, Cornhill. *hc*, E. Baxter, Dalston Lane; Dr. Case. *c*, — Lullham, Brighton.

**BLACK**.—1, A. Moody, Landport. 2, H. M. Maynard. *hc*, E. Orme, Derby. *c*, W. Baker, Portsea.

**BLACK-AND-WHITE**.—1, Mrs. Walter, Winchester. 2, W. Nottage, Northampton.

**COLOURED**.—1, T. Weighman, Hatfield. 2, W. T. Roberts, Landport. *hc*, T. G. Simpson (2); Mrs. Pocock; — Stowe. *c*, Miss Boville, Southsea; Mrs. Cull, Ringwood.

**KITTENS**.—1, T. Erice, Havant. 2, W. Watts, Fort Cumberland, Portsmouth. *c*, Nichols Bros.; B. Weigate, Gosport; R. S. Samways, Southampton.

**ANY OTHER VARIETY**.—Gold Medal, Lady D. Nevill, Dangstein. 2, O. Nicholson. 3, Mrs. Chantrell, Rottingdean, Brighton.

**JUDGES**.—*Poultry*: Mr. J. Martin, Claines, Worcester; Mr. P. H. Jones, London. *Pigeons*: Mr. J. Percival, London. *Cage Birds*: Mr. A. W. Willmore, London. *Rabbits*: Mr. Phelps.

*Cats*: Mr. P. H. Jones, London.

## PRESTON POULTRY AND PIGEON SHOW.

On the 7th and 8th this Show was held in the area of the Corn Exchange, Preston, and so far as the number of entries and the quality of the birds exhibited are concerned, may be considered to have been eminently successful. It is some twelve years since an exhibition of a similar description was held in the town, but it is intended, we understand, to establish the Show as an annual institution. A better place than the area of the Corn Exchange for such an Exhibition could not be obtained; it is well lighted. The Show was well arranged, and the improved zinc pens being used, every visitor was enabled without inconvenience to observe the exhibits. The poultry, comprising the major part of the Exhibition, were accommodated on tables in the area, there being three double rows of pens, reaching the length of the building, and one single row at the bottom or west end. The Pigeons were placed in single rows in the balconies.

The Dorkings were anything but good, but the Spanish and Cochins of both varieties were fine birds, and so also were the Brahmas, particularly the Darks. The Game fowl were a good show, and the Hamburgs were much admired, the Golden-spangled carrying off the palm in respect to quality. The French fowls made a splendid display, especially the Crève-Cœurs; and in the class for Any other variety there was a splendid array of birds, the Polands exhibited being particularly good. The Bantams throughout were capital, and the first and second (both Blacks) in the class for Black or White Bantams were really magnificent birds. There was an excellent show of Ducks, more especially in the fancy class. *Gerse* were strongly represented in point of quality, but only the first and second-prize winners among the *Turkeys* were worthy of notice. In the Selling classes there were some good birds, but on the whole these confined classes could not compare at all favourably with the open competitions, but this is only what might be expected, considering the conditions provided that the price should not exceed 40s. with an entrance fee of 4s.

The show of Pigeons on the whole was an excellent one, all the classes being well filled. The Dragons were splendid, many of the most noted breeders and fanciers in the kingdom being represented. The Antwerps and Barbs were also superior classes; but the French Owls were hardly up to the standard usually seen at shows of this extent. The English Owls, how-

ever, were capital, and the same remark may be applied to Turbits. The Nuns were far better birds than are generally exhibited, and in very good condition. Jacobins were a fair class, and among the Fantails were some splendid birds, including the pair which carried off the cup at the Crystal Palace Show. The Trumpeters were principally those of the recently-imported variety, and, like the majority of these birds exhibited in this country, they were much out of condition. The Judges regretted very much that birds of such great beauty could not be kept in better form, but their lack of condition is very probably owing solely to climatic influences. The Variety class comprised some fine birds, particularly a pair of Magpies, which were awarded premier honours.

**DORKINGS.—Coloured.**—1 and Cup, J. Walker, Rochdale. 2, J. Robinson, Garsbarr. 3, E. Fearon, Whitehaven. *Any other variety.*—1, J. Robinson. 2, L. Wren, Lowestoft.

**SPANISH.**—1 and Cup, J. Leeming, Broughton. 2, Furness & Sudall, Rawten-stall. 3, Pallister & Hawkins, Thresh; J. Leeming.

**COCHINS.**—*Cinnamon and Buff.*—1 and Cup, W. A. Taylor, Manchester. 2, W. A. Brinell, Southwell. 3, T. Stretch, Ormskirk; J. Robinson; W. A. Taylor. *Any other variety.*—1, T. Stretch. 2, W. A. Taylor. 3, W. Whitworth, jun., Manchester. 4, W. A. Taylor; J. & T. Weeks, Bootle, Carnforth. 5, J. Woods, Brimfield.

**BRAHMS.**—*Dark.*—1 and Cup, W. A. Taylor. 2, and 3, F. Andsell, St. Helens. 4, S. A. Smith, Withington, Manchester; J. Lyon, St. Helens. 5, D. Moulson, Bradford. *Light.*—1 and 2, T. J. Cotterill, Birmingham.

**GAME.—Any age or colour.—Cock.**—1, E. Aykroyd, Eccle-shill. 2, — Mason, Lancaster. 3, W. Ormerod, Todmorden; Barrow & Routhmell, Kendal.

**GAME.—Black or Brown Reds.**—1, T. Mason. 2, C. H. Wolff, Altrincham. 3, Miss Nelson, Hexham; J. Hurrell, Sunderland. *Any other variety.*—1 and Cup, D. Gibson, Barnard. 2, E. Aykroyd. 3, Morris & Woods, Accrington; T. P. Lyon, Liverpool.

**HAMBOURG.**—*Silver-pencilled.*—1, J. Robinson. 2, Duke of Sutherland, Trentham Hall. 3, H. Beldon, Bingley. *Golden-pencilled.*—1, H. Beldon. 2, G. J. Duckworth, Church. 3, W. Clayton, Keighley.

**HAMBOURG.**—*Silver-spangled.*—1, Ashton & Booth, Mottram. 2 and 3, J. Fielding, Newchurch. 4, Duke of Sutherland. *Golden-spangled.*—1, Cup, and 2, G. A. Duff, York. 3, W. A. Hyde, Ashton-under-Lyne. 4, N. Marlor, Luton; J. Bowness, Newchurch. 5, T. Dean, Keighley; J. Hall, Stacksteads; H. Beldon.

**HAMBOURG.**—*Black.*—1, Rev. W. Sergeantson, Shrewsbury. 2, H. Beldon. 3, N. Marlor; J. Fielding.

**FRENCH FOWLS.**—1, R. B. Wood, Uttoxeter. 2, J. J. Malden. 3, J. Robinson. 4, Mrs. E. Wilkinson, Greenhey; E. Harrison, Cottam; Miss S. Hornby, St. Michaels.

**ANY OTHER VARIETY.**—1 and Cup, W. A. Taylor. 2, W. Harvey, Sheffield. 3, H. Beldon. 4, T. Dean. 5, J. S. Rooth, Chesterfield; W. A. Taylor; H. Beldon.

**GAME BANTAMS.—Any age or colour.—Cock.**—1 and Cup, Miss M. J. Nelson. 2, J. Eaton, Grantham. 3, G. Hall, Kendal. 4, W. F. Entwistle, Bradford.

**BANTAMS.—Game.—Black or Brown Red.**—1, Miss M. J. Nelson. 2, W. F. Entwistle. 3, G. Hall. *Any other variety.*—1, J. Eaton. 2, G. Hall. 3, G. Hall. 4, A. Clark, Aspinwall. 5, W. F. Entwistle. 6, T. Barker, Burnley.

**BANTAMS.—Rock or White.**—1 and Cup, W. H. Shackleton, Bradford. 2, W. H. Robinson, Keighley. 3, H. Beldon. 4, W. Moore, Keighley; J. Walker. 5, J. Earnshaw, Rotherham. *Any other variety.*—1, E. Watton, Rawtenstall. 2, J. Walker. 3, M. Leno, Dunstable. 4, H. B. Smith, Broughton; Rev. W. Sergeantson; W. A. Taylor.

**DUCKS.—Aylesbury.**—1 and 2, J. Walker. 3, H. Frankland, Church. 4, Rouen. 5 and Cup, F. Wakefield, Nelson-on-Willows. 6, J. Walker. 7, S. H. Scott, Preston. 8, H. B. Smith; Rev. S. G. Perry, Ashton. *Black East Indian.*—1, Rev. W. Sergeantson. 2, J. J. Malden. 3, G. S. Sainsbury, Divizes; J. J. Malden; Rev. W. Sergeantson. *Any other variety.*—1 and 2, H. B. Smith. 3, J. Walker. 4, W. Binns, Tisbury. 5, H. B. Smith; M. Leno.

**GESE.**—1, Cup, and 2, J. Walker. 3, Rev. T. A. Peters, Alston College; H. Beldon. 4, W. Penny, Cottam; Barrow & Routhmell. 5, L. Anyon, Chorley.

**TURKEYS.**—1, J. Walker. 2, F. E. Rawson, Halifax. 3, J. Brookwell, Wigan.

**SELLING CLASS.—Brahma, Dorking, or Cochins.**—1, C. Sidgwick, Keighley. 2, E. Fearon. 3, H. Beldon. 4, J. Walker; Mrs. T. W. L. Hind, Kendal; T. T. Parker, Chorley; W. W. Rutledge, Kendal; G. Anderson, Accrington; W. A. Taylor; D. Moulson; J. F. Walton, Rawtenstall. 5, Mrs. T. W. L. Hind. 6, J. Leeming. 7, T. T. Parker. 8, T. W. Finch, Fulwood; W. Harvey. 9, T. T. Parker. 10, C. Sidgwick; W. W. Rutledge.

**SELLING CLASS.—Any other variety.**—1, A. Bamford, Middleton. 2, H. Beldon. 3, J. Leeming. 4, H. B. Smith. 5, Furness & Sudall. 6, Pallister and Hawkins. 7, T. P. Lyon; J. Leeming.

**SELLING CLASS.—Ducks.**—1, T. Wakefield. 2, D. Gibson. 3, H. Frankland.

#### PIGEONS.

**CARRIERS.—Cocks.**—1, Cup, and 2, E. Horner, Leeds. 3, G. J. Taylor, Huddersfield; E. C. Stretch, Ormskirk. 4, H. Yardley, Birmingham; R. Fulton, London. 5, H. B. Smith; Rev. S. G. Perry, Ashton. *Black East Indian.*—1, Rev. W. Sergeantson. 2, J. J. Malden. 3, G. S. Sainsbury, Divizes; J. J. Malden; Rev. W. Sergeantson. *Any other variety.*—1 and 2, H. B. Smith. 3, J. Walker. 4, W. Binns, Tisbury. 5, H. B. Smith; M. Leno.

**POUTERS.—Cock.**—1, W. Harvey. 2, Mrs. Ladd, Calne, Wilts. 3, E. Horner. 4, Fulton. 5, H. B. Smith. 6, W. Harvey. 7, Mrs. Ladd; Major J. H. Croft, Southport. 8, Fulton.

**DRAGONS.—Blue or Silver.**—1 and 2, F. Graham, Birkenhead. 3, T. Charley, Blackburn. 4, W. Hill, Handforth. *Any other variety.*—1 and Cup, F. Graham. 2, W. Hill. 3, J. Thompson, Bingley. 4, F. Graham; W. Hill.

**ANTIPEPS.—1, W. Gamon, Chester. 2, J. Gardner, Preston. 3, W. E. Bull, Newport Pagnell; W. Gamon; H. Yardley; J. Gardner.**

**FAHNS.—1 and Cup, F. Wild. 2, G. J. Taylor. 3, F. Wild; E. Horner; J. Stanley, Blackburn; R. Fulton.**

**TRUMPETERS.—Almond.**—1, W. Harvey. 2, R. Fulton. 3, J. Gardner; E. Horner; J. J. Black, Preston. *Any other variety.*—1, J. Fielding. 2, H. Yardley. 3, G. J. Taylor. 4, E. Horner.

**OWLS.—Foreign.**—1, F. Wild. 2, E. Horner. *English.*—1, W. Binns. 2, H. Vernon, Liverpool.

**TURBIS.**—1 and Cup, W. Croft, Ripley. 2, J. Gardner. 3, S. Salter, Oxford; R. Fulton.

**NUNS.**—1, W. Croft. 2, E. Horner. 3, W. Croft; W. Harvey; E. Horner. 4, J. Robinson. 5, J. Thompson. 6, R. Fulton. 7, G. J. Taylor; E. Horner.

**FANTAILS.**—1 and 2, Rev. W. Sergeantson. 3, F. J. Loversidge, Newark; E. Horner; W. Hill.

**TRUMPETERS.**—1 and Cup, J. Lederer, Liverpool. 2, W. Harvey. 3, R. Fulton.

**ANY OTHER VARIETY.**—1, T. W. Ainsworth, Houghton. 2, J. Gardner. 3, H. Yardley; W. Harvey. 4, J. Taylor; E. Horner; W. Hill.

**SILVER CLASS.—Price not to exceed 80s.**—1 and 2, W. Hill. 3, E. Horner.

**JUDGES.—Poultry:** Mr. Brierley, Middleton; Mr. R. Teebay, Fulwood. **Pigeons:** Mr. F. Esquilant, Brixton. —(Preston Guardian.)

**FAKENHAM POULTRY SHOW.**—The entries close on the 20th inst., and the schedule merits the attention of exhibitors. There

are thirty-six classes for poultry, two for Rabbits, eleven for Pigeons, and eleven for cage birds. Thirteen cups are offered for competition.

#### ABERDEEN POULTRY AND PIGEON SHOW.

It has been the custom of late when reporting on Pigeon and poultry shows to begin with an account of the railway journey, the probable collision on the way, a description of the town where the show is held, and the dinner in the evening, and what was said and done at the same; but on this occasion, as our report will be of unusual length, we will leave the granite city and Union Street alone, and begin at once by saying that the Show was held in the Volunteer Drill Hall, a building admirably adapted for the purpose and lent gratuitously to the Club, an example worthy of imitation in other towns. The poultry were arranged close to the walls, and the Pigeons on four long tables in the centre of the Hall, with ample space between.

#### PIGEONS.

The Pigeons numbered 409 pens, of which 207 were Pouters; and the verdict of the Judges—Mr. James Muir, of Glasgow, and Mr. J. Hawley, of Gillington, near Bradford—regarding the latter was that such a collection was never seen at any show before. There is no doubt that this result was owing to the magnificent birds of Mr. George Ure, of Dundee, who has not exhibited this season before. This gentleman has succeeded in bringing the Pouter almost to perfection, and his Blacks and Yellows are now equal in every respect to the Blues and Reds, which have long been best in shape and style. But we must proceed with our detailed description of the most noticeable birds.

The Pouters commenced with No. 286 in the catalogue. Blue-pied cocks, any age, were thirteen pens. No. 288 (T. Rule), third prize, was a bird of good colour and marking, but rather fanly about the legs, which were a trifle rough. No. 289 (J. E. Spence), highly commended, had neither marking, style, nor crop to commend him, but was the longest Pouter in the Show, being 21 inches long and over 7 inches in the leg. No. 290 (A. H. Stewart), first prize and cup for the best old cock, was recognised as one of the young Blues at Glasgow a year ago, where he was passed with a mere commendation. He is a grand bird with a beautiful crop, fine style, and of the best colour, but a little too wide in the pinion. There was no grumbling at the decision of the Judges here, and the bird reflects credit on his breeder, Mr. G. Ure. No. 294 (G. Ure), though unnoticed, was in our opinion one of the best, and worthy of one of the prizes. He has a fine bill, moon, stocking legs, and style, but solid wings. No. 296 (G. Ure), second prize—there was not much to choose between him and the last-mentioned, but we preferred 291. No. 297 (R. Fulton)—this was the bird bred and exhibited by the late James Miller, of Glasgow, at the Glasgow Show a year ago, when he was allowed to be the handsomest bird there, but his chequered marks spoil his chance of a prize. We think he has thickened a little, and he wanted the long toe-feathers he had last year. With clean stocking limbs these feathers set off a bird immensely, and fanciers should be careful when packing their Pouters not to confine them so as to injure their feet.

Black cocks, any age, were eight pens, and the colour of most of them was perfection. The contrast between the Black and White is so decided, that Pouters of this colour, when first-rate, look, perhaps, better than any. No. 300 (J. W. Bryce), commended, wanted bib, and was very foul below—a prevailing fault in Blacks, though a good many of them that look so well in their pens are in the habit of leaving their foul thigh-feathers in their lofts behind them. No. 301 (J. Grant), highly commended, is past his best showing days, being heavy. He is of a good colour and marking, but roughish in the legs. If we mistake not this bird was first at the late Glasgow Show, and his position there was thought to be a mistake. No. 302 (G. Ure), we thought, as we saw the bird on the last day of the Show, that he was the best in the class. Of a glossy raven colour, perfectly marked, and long in feather, with beautiful stocking legs, he was the *beau idéal* of a Black Pouter, but he sat sulking by the side of the pen, and would not come out. He is called the Black Prince, after a champion of former days, and his owner may well be proud of him. No. 303 (R. Fulton), first prize, was a bird of good colour and marking, and, when showing on his block, a very taking bird, with an enormous crop; when off the block, however, he is rather of the level style, and seems wanting behind; he is rough-legged. No. 304 (G. Ure), second prize, is a finely-coloured cock, and well marked. He is rather wide-legged, but of a good shape, and stylish. In our opinion, however, he is not to be compared with the unnoticed Black Prince. No. 305 (J. White).—This bird sat sulking till the last day of the Exhibition, and would not show. When he did come out he proved himself a grand one. With a crop as big and round as a fish globe, and perfect colour and marking, he looked a giant. He was bred by Mr. Ure, and was first in the young class for Blacks at Glasgow last year. No. 306 (G. Ure), third prize, was without doubt the best style of a Pouter among the lot. Of immense length of feather and leg, with good

marking, thin girth, and large crop, his faults were a rather dusky colour and roughish legs.

Red cocks of any age contained ten pens. The Reds are in want of attention. The right colour, as seen sometimes in Jacobins, combined with something like perfection in other points, is still a desideratum. A rich dark Red with a metallic lustre on the feathers is a most beautiful colour, but seldom seen, and if fanciers do not beware may be lost entirely. There are still a few of them in existence, though small and imperfect as Pouters, and by their assistance we hope the colour may be restored. No. 307 (J. C. Lyell), a cock of very good colour, within a shade or two of the right thing. Short in feather, but long and shapely in leg, with fair marking; he is a valuable bird as Reds are at present. He was bred by Mr. Montgomery, of Belfast, who took the medal for young Red cocks at Edinburgh two years ago with him. No. 308 (G. Wallace), commended, a well-marked bird of good quality, but weak though not bad in colour. No. 310 (G. Ure), third prize, a very stylish bird, which might have been better placed for a white side. His colour was good as Reds go. No. 311 (R. Fulton), a bird of colour, not far wrong, with a fine moon and bib, but no pinion. No. 313 (A. Wright), second prize. We thought this one not entitled to his position. He had little bib, gay sides, and was only moderate in colour. No. 314 (R. Fulton), the only true-coloured cock in the class but otherwise undesirable. No. 315 (J. White), first prize. No doubt the best as a Pouter in the class, but decidedly bad in colour. He has a splendid bib and crop, but rather gay sides. He took the second prize at Glasgow last month.

The old Yellow cocks were seven in number and commenced with 317 (W. Ridley), third prize, a handsome well-shaped bird, of very good colour but deficient in bib and pinion. No. 319 (G. Ure), second prize, was of good shape and fairly marked on the crop, but without pinion. No. 323 (J. Mitchell), first prize, was a magnificent Pouter, but bad in colour and marking. He won for crop, style, length, and perfectly-shaped and feathered legs.

White cocks, any age, were eleven pens. No. 324 (J. C. Lyell), commended, was a good bird all over, but of small size. No. 325 (W. Ridley), second prize, a long bird both in feather and limb, the latter well feathered, and a capital cropped bird. No. 329 (J. Grant), good also in all points, with a thin girth and well entitled to his position of first prize. No. 330 (J. E. Spence), third prize, wanted length of leg, and ought to have changed places with No. 334, the highly commended bird of J. White.

The class for other coloured cocks of all ages brought out thirteen, and amongst them were some birds of grand proportions. They commenced with No. 335 (McGill Skinner), a grand Mealy, not to be beaten for Pouter points by any bird in the Show. No. 336 (J. Grant), a good Blue-chequer. No. 338 (G. Ure), a silvery Mealy, splendid in crop, girth, and length, gained the third prize, and we much preferred him to No. 345 (A. Frame), the winner of second honours, a dark Blue-chequer of good proportions, but deficient in marking, and with too heavily covered limbs. We shall continue our remarks next week.

**DORINGS.—Cock**—1, A. Allan, Udney Castle. 2, A. Mathieson, Stonehaven. 3, T. Pirie, Bridge of Dee. 4, and 5, D. Bellamy, Meikle. 6, J. Mitchell. 7, J. Clark, Fochabers. 8, P. Campbell, Oldbath, New Deer. **Chickens**—1, Cup and 2, J. Clark. 3, Mrs. Morrison, Coney Park Nurseries, Stirling. 4, J. Mitchell. 5, Mrs. D. Fordyce, Brucklay Castle. 6, L. Stewart, Keig, Whitehouse.

**SPANISH.—Cock**—1, J. Philip, Auchinell. 2, R. Silver, Auchinell. 3, J. Dun, cab, Blackburn. **Hens**—1 and Cup, A. Redpath, Liberton. 2, J. Philip. 3, R. Philip, Auchinell. 4, Mrs. W. Steven, Turiff. **Chickens**—1, R. Silver. 2, Mrs. W. Steven. 3, W. Mathie, Auchinell.

**COCHIN-CHINA.—Cock**—1, G. H. Proctor, Durham. 2, J. Mitchell. 3, Miss E. Brooks, Forest of Glenbarrow. **Hens**—1 and Cup, G. H. Proctor. 2, W. M. P. Paton, Broughty Ferry. 3, A. Burnett, Montrose. 4, Miss E. Brooks. **Chickens**—1, G. H. Proctor. 2, Mrs. Armstrong, Inchmarine. 3, A. Stephen.

**BRAMAS.—Cock**—1 and Cup, J. Mitchell. 2, J. Powick, Aberdeen. 3, Capt. Hunter, Tillyrie. 4, Dr. Wilson, Old Meldrum. **Hens**—1, A. Dawson. 2, Capt. Hunter. 3, Summer, Whitehouse. **Chickens**—1, J. Powick. 2, Capt. Hunter. 3, J. Stewart, Inchburgh.

**HOLDANS.—Cock**—1, J. T. Loversidge, Newark. **Hens**—1 and 3, Mrs. Elain, Aberdeen. 2, J. Edgar, Newark. **Chickens**—1, J. F. Lumsden, Auchry House. 2, W. C. King. 3, Dr. Simpson, Forbes.

**HAMBURG.—Gold or Silver pencilled**—1, J. Baillie, Ruthrieston, Aberdeen. 2, J. Stevenson, Airdrie. 3, W. Chalmers, Hallyburt, 4, J. Connon, Woodside. 5, G. Cairness, Carnoustie. 6, W. Duthie, Glenberry. 7, G. Linn, Persley, Woodside. 8, G. Scorgie, Aberdeen. 9, J. McEllis, Auchinell. 10, J. Stevenson. 11, J. Innes, Bankhead. 12, J. Connon, Mrs. Leslie, Aberdeen. 13, W. Hadden, Johnstone, Bonydrie. 14, A. Bowie, Carlisle. 15, A. Mathieson.

**HAMBURG.—Gold or Silver spangled**—1, J. Macandrew, Carnoustie. 2, J. Duffus, New Pittarig. 3, A. Strathdee, Brachhead, Stonehaven. 4, Mrs. E. Brown, Abercrombie. 5, A. Coutts, Bankhead, Auchinell. 6, Mrs. D. Fordyce. 7, J. Duffus. 8, J. Macandrew, Aberdeen. 9, A. Strathdee. 10, Mrs. D. Fordyce.

**GAME.—Cock**—1 and Cup, T. Mitchell, Perth. 2, A. Dawson, Forbes. 3, Miss J. M. Frew, Kirkcaldy. 4, Mrs. R. Stewart, Blairadam. 5, A. Forsyth, Bankhead. 6, Cockerel, 1, T. Mason, Lancaster. 2, A. Stephen. 3, J. Mackay. 4, Hen or Pullet, 1, S. Wilson, Burnieboozle. 2, Miss R. Frew, Kirkcaldy. 3, T. Mitchell. 4, A. Burnett.

**CROSSBRED FOWLS.—Hens**—3, Mrs. D. Fordyce.

**SELLING CLASS**—1, W. Bowie, Montrose. 2, W. Webster, Lower Middlefield, Woodside. 3, Mrs. D. Fordyce. 4, J. McEllis. 5, Mrs. D. Fordyce. 6, J. Mackie, Woodside. 7, A. Wilson, Whitehouse. 8, Mrs. W. Steven. 9, T. Skinner.

**GAME BANTAMS.—Cock**—1, J. Grieve, 2, Mrs. R. C. Frew, Kirkcaldy. 3, J. Rowell, Clough Dene. 4, J. Donald, Bridge of Alford. 5, J. Robertson, Woodside. 6, Hen or Pullet, 1, Mrs. R. Frew. 2, J. Mackay. 3, J. Grieve.

**BANTAMS.—Any other variety**—1 and Cup, Mrs. R. Frew. 2, J. Taylor. 3, J. Duffus, Montrose.

**DUCKS**—1, A. Skinner. 2, J. F. Lumsden. 3, J. Davidson, Craigiebuckler. 4, A. Burnett. 5, A. Bowie.

**TURKEYS**—rhe, G. Bruce.

## PIGEONS.

**POUTERS.—Blue-pied.—Cocks**—Cup and 1, A. H. Stewart, Birmingham. 2, G. Ure, Broughty Ferry. 3, T. Rule, Durham. 4, J. G. K. Spence. 5, R. Fulton, Northcote, London.

**POUTERS.—Black-pied.—Cocks**—1, R. Fulton. 2 and 3, G. Ure. 4, J. Grant, Edinburgh. 5, R. W. Bryce.

**POUTERS.—Red-pied.—Cocks**—1, J. Whyte, Aberdeen. 2 and 4, A. Wright, Leith. 3, G. Ure. 5, G. Wallace, Burnbank, Glasgow.

**POUTERS.—Yellow-pied.—Cocks**—1, J. Mitchell. 2 and 4, G. Ure. 3, W. Bailey. 5, T. Rule.

**POUTERS.—White.—Cocks**—1, J. Grant. 2, W. Ridley. 3, J. G. Spence. 4, J. White. 5, J. C. Lyell, Montith.

**POUTERS.—Any other colour or marking.—Cocks**—1, McGill Skinner, Edinburgh. 2, A. Frame, Larkhall. 3, G. Ure. 4, J. Mitchell. 5, J. S. & A. Robb, Cumberston, Alloa.

**POUTERS.—Blue-pied.—Young Cocks**—1, J. C. Lyell. 2, 3, and 5, G. Ure. 4, R. Fulton.

**POUTERS.—Black-pied.—Young Cocks**—Cup and 1, G. Ure. 2, G. Schaschke, Aberdeen. 3, J. Grant. 4, D. Stewart, Perth. 5, J. Mitchell.

**POUTERS.—Red-pied.—Young Cocks**—1, A. Wright. 2, W. Rutherford. 3, A. Frame. 4, R. Fulton. 5, J. Grant.

**POUTERS.—Yellow-pied.—Young Cocks**—1, 2, and 3, G. Ure. 4, G. Robinson, Sunderland. 5, J. Grant.

**POUTERS.—White.—Young Cocks**—1, McGill Skinner. 2, J. White. 3, R. Fulton. 4, W. H. Dry, Aberdeen. 5, F. McCrae, Aberdeen.

**POUTERS.—Blue-pied.—Hens**—1 and 4, G. Ure. 2, K. Fulton. 3, A. H. Stewart. 5, J. C. Lyell.

**POUTERS.—Red-pied.—Hens**—Cup and 1, W. Ridley. 2, J. M. D. Brown, Edinburgh. 3, A. Frame. 4, J. C. Lyell. 5, R. Fulton.

**POUTERS.—Yellow-pied.—Hens**—1, K. Fulton. 2 and 4, G. Ure. 3, A. H. Stewart. 5, J. White.

**POUTERS.—White.—Hens**—1, W. Ridley. 2 and 4, R. Fulton. 3, W. Stiles, Kilmarnock. 5, G. Wallace.

**POUTERS.—Any other colour or marking.—Hens**—1, J. Mitchell. 2, J. E. Spence. 3, G. Ure. 4, W. H. Dry, 5, J. C. Lyell.

**POUTERS.—Blue-pied.—Young Hens**—1, G. Wallace. 2, G. Ure. 3, McGill Skinner. 4, A. H. Stewart. 5, W. Rutherford, Edinburgh.

**POUTERS.—Black-pied.—Young Hens**—1, 2, and 3, G. Ure. 4, G. Schaschke. 5, R. Fulton.

**POUTERS.—Red-pied.—Young Hens**—1, J. S. & H. Robb. 2, J. C. Lyell. 3, R. Fulton. 4, G. Wallace. 5, G. Ure.

**POUTERS.—Yellow-pied.—Young Hens**—Cup, 1, and 2, G. Ure. 3, Capt. W. C. Thomson, Broughty Ferry. 4, J. Grant. 5, J. M. D. Brown.

**POUTERS.—White.—Young Hens**—1 and 3, J. Grant. 2, G. Schaschke. 4, W. Stiles. 5, McGill Skinner.

**CARRIERS.—Cocks**—1, E. C. Stretch, Ormskirk. 2, R. Fulton. 3, J. E. Spence. 4, W. Ridley. 5, D. Laurie. **Hens**—Cup and 1, W. Ridley. 2 and 3, R. Fulton. 4, D. Laurie. 5, J. E. Spence.

**TUMBLERS.—Short-faced.—Cup**, 1, and 4, R. Fulton. 2 and 3, T. Rule. 5, W. Brydone, Dunse. **Common Flying not short-faced**—1 and 3, W. B. Mapplebeck, Moseley. 2, A. Anderson. 4, A. H. Imrie. 5, F. McCrae.

**BARDS**—1, R. Fulton. 2, G. Wallace. 3, W. Brydone. 4, J. E. Spence. 5, R. W. Bryce, Edinburgh.

**FANTAILS**—Cup and 1, Capt. W. C. Thomson. 2 and 3, G. Ure. 4, A. Smith. 5, J. F. Loversidge.

**JACOBINS**—1 and 3, T. Rule. 2, R. Fulton. 4, W. & R. Davidson, Montrose. 5, D. Stewart.

**TRUMPETERS**—1 and 4, T. Rule. 2, R. Fulton. 3, J. Lederer, Bootle. 4, T. L. Johnstone, Montrose.

**OWLS.—English**—1 and 4, E. Lee, Nantwich. 2, R. W. Bryce. 3, W. J. Steven. 4, T. L. Johnstone. **Foreign**—1, K. Fulton. 2 and 4, T. Rule. 3, W. Brydone. 5, R. W. Bryce.

**TUCKERS**—1, A. Anderson. 2 and 4, R. & J. Anderson, Newcastle. 3, R. Fulton. 5, G. Tough, Aberdeen.

**NESS**—1 and 2, A. H. Imrie, Ayr. 3, T. L. Johnstone. 4, and 5, W. Symon, Dufftown.

**DRAGONS**—1 and 2, W. Gamon, Chester. 3, R. Fulton. 4, E. C. Stretch. 5, R. W. Bryce.

**ANTHRAPIES.—Short-faced**—1 and 4, W. Gamon. 2, D. Laurie. 3, R. Fulton. 4, Miss R. C. Frew. 5, J. C. Cowe, Aberdeen.

**SELLING CLASS**—1, T. Rule. 2, W. Hendry (Pouter). 3, R. J. Anderson. 4, W. J. Steven, Montrose. 5, A. Frame.

**JUDGES.—Poultry**: Mr. D. Brown, Perth; Mr. J. Anderson, Blairgowrie; Mr. J. M. Campbell, Bonnykelly. **Pigeons**: Mr. J. Hine, Glasgow; Mr. J. Hawley, Girlington, Bradford.

## KIRKCALDY POULTRY SHOW.

This was held on the 5th and 6th inst., in the Corn Exchange. There were 435 entries of poultry and Pigeons, and upwards of 120 of Cage Birds. The following are the awards:—

**GAME (Black Red).—Cock**—1, J. Mason, St. John's, Worcester. 2 and 3, D. Harley, Edinburgh. 4, R. Stewart, Killy, Edinburgh. 5, T. & Co. Bath, Forfar. 6, J. Wishart, Links, Kirkcaldy. **Hen**—1, Local Cup, and 3, J. Wishart. 2, J. Fisher, Links, Kirkcaldy. 4, D. Harley. 5, J. Mason. 6, J. Jamieson, Forfar; J. Wishart.

**GAME (Brown Red).—Cock**—1, D. Harley. 2, Master D. Laing, Kirkcaldy. 3, H. W. Hutchison, Brachhead, Kirkcaldy. 4, W. Webster, Denburn, Kirkcaldy. 5, R. Stewart. 6, J. Graham, Kirkcaldy. **Hen**—1, D. Harley. 2 and 4, J. Stark. 3, J. Wishart. 5, A. Blair, Blairgange, Dollar. 6, T. W. Mitchell, Perth; C. Jamieson.

**GAME (Any other colour).—Cock**—1 and Local Cup, Master A. Frew, St. Clairtown, Kirkcaldy. 2, J. Tennant, Newtown, Kirkcaldy. 3, D. Simpson, Sandyloan, Kirkcaldy. 4, R. Stewart. 5, D. Harley. 6, J. Mason. **Hen**—1, R. Stewart. 2, R. Stark. 3, D. Harley. 4, J. Mason. 5, J. Penman, Dysart. 6, J. Dunsin, Newtown, Kirkcaldy.

**DORINGS (Silver).—Cock**—1, T. Raines, Bridge Haugh, Stirling. 2, J. Turnbull, Falkirk. 3, D. Anan, Cupar. **Hens**—1 and 3, T. Raines. 2, J. Turnbull. 4, D. Anan.

**DORINGS (Dark).—Cock**—1 and 3, T. Raines. 2, R. Lockhart, Inchrye Abbey, Newburgh. 4, J. Turnbull. **Hens**—1, G. S. Robb, Leslie. 2, D. Draper, juv., Fackie. 3, Mrs. M'Arthur Moir, jun., Hillcote, Dollar. 4, T. Raines (2). 5, A. Haggart, Leslie.

**COCHIN-CHINA.—Cock**—1, Mrs. M'Arthur Moir, jun. 2, J. Hine, Kendal. 3, J. W. Falkirk. 4, Mrs. M'Arthur Moir, jun. 5, J. Wye. **Hens**—1 and 2, Mrs. M'Arthur Moir, jun. 3 and 4, Mrs. Oswald, Dunmkier, Kirkcaldy. 5, D. Penman, Dysart.

**BRAMAS.—Cock**—Cup, 1, and 3, T. Raines. 2, Mrs. M'Arthur Moir, jun. 4, Lieut. Col. C. Rice, Edinwood, Cupar; J. Smart, Carnoustie; J. S. N. Kirkcaldy. **Hens**—1 and 4, T. Raines. 2, Miss Menison, Kirkcaldy. 3, Lieut. Col. C. Rice. 5, Mrs. M'Arthur Moir, jun. 6, J. Seton, Miss Blair.

**SPANISH.—Cock**—1, R. Somerville, Edinburgh. 2, W. Bonthron, Airdrie. 3, J. Hine. 4, W. Burdison, Kirkcaldy. 5, A. Ridpath, Peffermill, Edinburgh. 6, W. Hinchison. **Hens**—1 and 3, R. Somerville. 2, A. Ridpath. 4, W. Bonthron. 5, J. Hunter, Alva.

**HAMBURGS (Pencilled).—***Cock*.—1, Miss Pratt. 2, A. Pratt, Kirkcaldy. 3, R. Dickson, Selkirk. *he*, W. R. Park, Abbotsmear, Melrose. J. Meldrum, Dunfermline; A. Hannan, Baldringburn, Dunfermline. *Hens*.—1, J. M. Harvey, Edinburgh. 2, J. M. Rosslyn, Dysart. 3, R. Cameron, St. Clairtown, Kirkcaldy. *he*, W. R. Park.

**HAMBROHS (spangled).—***Cock*.—1, W. R. Park. 2, A. Edward, Dundee. 3, F. A. Smart, Kirkcaldy. *Hens*.—1, J. M. Campbell, Bonny Kelly, New Blyth. 2, Mrs. Brown, Abercainry. 3, A. Edward. *he*, W. R. Park.

**DUCKS.**—1, Mrs. Dickie, Alva. 2, Mrs. McArthur, Moir, jun. 3, Lieut.-Col. C. Rice. *he*, W. Herd, Pathhead, Kirkcaldy.

**ANY OTHER VARIETY.**—1, W. R. Park. 2, D. Wallie, Haymarket, Edinburgh. 3, J. Stark. *he*, D. Wallie; A. Wyllie, Johnstone, Paisley; J. M. Harvey; D. Ross, Kirkcaldy. *c*, D. Draper, jun.; R. Taylor, Stehousenmuir, Larbert.

**BANTAMS (Game, Reds).—***Cock*.—1, Master D. Laing. 2 and 3, J. Seton. *he*, W. Robertson, Brucefield, Dunfermline; T. Young, Belside, Morpeth; J. R. Kilgour, Crossgates; W. Atkinson, Kendal. *c*, Miss R. Frew, St. Clairtown, Kirkcaldy; W. Robertson. *Hens*.—1 and 2, J. Seton. 3, G. E. Scobie, Dunfermline; J. Young, Links, Kirkcaldy. *he*, W. Fisher, Cherryfield, Dundee; Mrs. R. Frew.

**BANTAMS (Game, any other colour).—***Cock*.—1 and 2, J. Seton. 3, Miss J. M. Frew, St. Clairtown, Kirkcaldy. *he*, J. Seton; A. Hutchison, Kirkcaldy. *Hens*.—1 and 2, J. Seton. 3, Master A. Frew.

**BANTAMS (Any other variety).—**1, Miss R. Frew. 2, J. Ratherford, Nochnarie, Auchtermuchty. 3, R. H. Ashton, Mottram.

**SELLING CLASSES.**—*Cock*.—1, W. Linton, Selkirk (Crève-Cœur). 2, Lieut.-Col. C. Rice (Brahma). 3, D. Annan (Dorking). *he*, Lieut.-Col. C. Rice (Brahma); J. McGill, Fife (Spanish); Mrs. Oswald (Cochin); A. Kidpath (Spanish); R. Somerville (Spanish). *Hens*.—1, Lieut.-Col. C. Rice (Brahma). 2, Miss G. Morrison (Brahma). 3, Mrs. Oswald. *he*, K. B. Heggie (Dorking).

#### PIGEONS.

**POUTERS (White).—***Cock*.—1, M'Gill Skinner, Edinburgh. 2, J. E. Spence, Broughty Ferry. 3, R. W. Bryce, Edinburgh. *Hens*.—1, R. W. Bryce. 2, M'Gill Skinner. 3, J. M. D. Brown, Edinburgh.

**POUTERS (Any other colour).—***Cock*.—1, J. M. D. Brown. 2, M'Gill Skinner. 3, J. E. Spence.

**CARRIERS.**—1, J. E. Spence. 2, J. Lamont, jun., Edinburgh. 3, J. M. D. Brown.

**FANTAILS.**—1, J. E. Spence. 2, A. Pratt. 3, A. Crosbie, Abbotsmeadow, Melrose.

**TUMBLERS.**—1, M'Gill Skinner. 2, J. E. Spence. 3, J. Day, Edinburgh. *c*, J. M. D. Brown.

**NUSS.**—1, R. Laurie, Melrose. 2 and 3, T. L. Johnstone, Montrose.

**JACOBS.**—1, R. Rames, Bridge Haugh, Strirling. 2, T. Leckhart, Kirkcaldy. 3, A. McConochie, jun., Kirkcaldy.

**TURBOTS OR OWLS.**—1 and 3, R. Laurie. 2, A. Crosbie. *c*, T. L. Johnstone.

**ANY OTHER VARIETY.**—1, J. E. Spence. 2, A. Crosbie. 3, R. Rames.

#### CANARIES.

**SCOTCH FANCY (Yellow).—***Cock*.—Medal and 1, R. Aird, Edinburgh. 2, E. Currens, Cowdenbeath. 3, W. Bonthron, Airdrie. 4, G. Spence, Dysart. 5, G. Stewart, Cupar. *Hens*.—1, D. Black, Netherthorn, Dunfermline. 2, A. Blaikie, Edinburgh. 3, J. Tweedie, Blairadam. 4, J. Kerr, Watergate, Perth. 5, J. Smith, Coatbridge.

**BUFF.**—*Cock*.—1, J. Kerr. 2, J. Hogg, Oakley, Dunfermline. 3, D. Black. 4, J. Tweedie. 5, J. Smith. *Hens*.—Medal and 1, D. Kilgour, Crossgates. 2, G. Greig, Edinburgh. 3, W. Bonthron. 4, W. Lawson, Kirkcaldy. 5, J. Henderson, St. Clairtown, Kirkcaldy.

**FLECKED (Yellow).—***Cock*.—1, R. Chalmers, Kirkcaldy. 2, J. Kyle, Leath. 3, J. Smith. 4, W. Hogg, Oakley, Dunfermline. 5, H. McDougal, Edinburgh. *Hens*.—Medal and 1, R. Hunter, Kirkbrae, Galashiels. 2, H. McDougal. 3, G. Spence. 4, J. Grieve, Leith. 5, R. Hunter.

**FLECKED (Buff).—***Cock*.—Medal and 1, R. Currens, Cardenden. *Hens*.—1, J. Kerr. 2, M. Ramsay, Links, Kirkcaldy. 5, T. Currens, Cardenden. *Hens*.—1, J. McKeljohn, Oakley, Dunfermline. 2, H. McDougal. 3, D. Kilgour. 4, A. Blaikie. 5, W. Lawson.

**GREEN.—***Cock or Hen*.—1, G. Spence. 2, R. Hunter. 3, H. McDougal. 4, J. Hardie, Galashiels. 5, J. Forbes, St. Clairtown.

**FOULFEATHERED.—***Cock or Hen*.—1, P. Alexander, Raith, Kirkcaldy. 2, J. McKeljohn. 3, M'Erwen Downie, Links, Kirkcaldy. 4, J. Grieve, Leith. 5, J. Kerr.

**GOLDFINCH MULE (Yellow or Buff).—***Cock*.—1 and 2, W. Kirk, Dunfermline. 3, 4, and 5, J. Robertson, Aberdeen.

**JUDGES.—***Poultry*: Mr. R. Teebay, Preston. *Pigeons*: Mr. A. Frame, Larkhall. *Canaries*: Mr. A. Buchanan, Glasgow; Mr. D. Johnston, Glasgow.

## BELFAST AND NORTH OF IRELAND POULTRY SHOW.

(From a Correspondent.)

THE Belfast and North of Ireland Ornithological Society held its first Exhibition in the Ulster Hall, Belfast, on the 8th, 9th, and 10th inst., and considering the very short time which has elapsed since its formation, the promoters have every reason to be proud of its success. The list of entries—516, the superior quality of the different specimens, and the smooth regularity with which all the proceedings were carried out, all prove that the success of its first venture must be ascribed to the experience of the officials and the confidence of exhibitors in their integrity. Much difficulty was experienced in obtaining the services of Judges, as many of the old stagers were either too full of engagements or afraid of the Channel passage. By the way, this is a bugbear which is becoming beautifully less every year, as the passage from any part of the sister kingdoms can now be quickly and pleasantly made *via* Stranraer, and exhibitors need have no apprehension when sending their birds by this route, as the carrying officials have shown themselves ready to afford every facility in their power to insure the safe transmission of all feathered stock committed to their care. To return, however, to the Judges. Their awards in every department gave general satisfaction, and the proverbial "dissatisfied exhibitor"—whose mutterings are sometimes deep but not always low—was nowhere to be seen. This must be gratifying to the Judges, as from our observation we are certain that if any error had been made it would have been from accident and not want of care.

We have not space to analyse the different classes, but will mention a few which attracted our particular attention. *Dorkings*, with the exception of the cup birds—which were fair—

were far from good. *Cochins*, if not numerous were remarkably good, and the same may be said of *Dark* and *Light Brahmas*; the former, which appear to rise in favour at every exhibition, were a very good class, the cup pen, which were in splendid condition, being hard pressed by the second and third-prize winners. In this class we noticed some young birds which we expect, when more fully developed, will stand prominent at future exhibitions. *Spanish* and *French* breeds were good; *Hamburghs* fair; *Game*, small in number but of first-rate quality. The cup pen of *Game Bantams* were perfect gems, the cock being considered as near perfection as possible. The Selling classes had large entries of good birds, and sales were numerous. *Ducks* were a splendid show, and well deserved a cup; we preferred the second-prize *Aylesburys* to the first. *Geese* and *Turkeys* were also good.

*Pigeons*—we pause here, any remarks of ours would be superfluous after stating that the "Champion Dun" was there, and though pronounced a very aristocratic bird, he had no reason to be ashamed of the company that surrounded him, as they were throughout in splendid form and condition.

*Cage Birds*, though not numerous, were of good quality.

**DORKINGS.**—*Coloured*.—1 and Cup, W. G. Mulligan, Springfield, Belfast. 2, J. C. Cooper, Limerick. *Silver-Gray or White*.—1, Miss Fairhurst, Ormskirk. 2, E. P. Williams, Glasdin, Clontarf. 3, A. McLean, Ballyvaughan. *Cochins*.—*Cinnamon or Buff*.—1 and Cup, L. Stone, Dublin. 2, W. G. Mulligan. 3, F. Robertson, Cliftonville. *Any other variety*.—1, J. K. Milner, Chertbury, Blackrock. 2, L. Clark, Manchester. 3, R. A. MacDonald, Ballyvaughan. *c*, Mrs. J. Firth, New Barnsley, Belfast.

**BRAHMAS.**—*Dark*.—1 and Cup, L. Clark. 2, 3, and *he*, J. Stuart, St. Helensburgh. *c*, H. J. McBride, Gifford; J. Stuart. *Light*.—1, J. Forrest, Millamore, Milntown. 2, E. T. Herdman, Strabane. 3, R. Fulton, Brockley Road, New Cross, London.

**SPANISH.**—1 and Cup, J. A. Smyth, jun., Londonderry. 2 and 3, W. G. Mulligan. *he*, J. C. Cooper.

**FRENCH.**—1, Cup, 2, and 3, J. C. Cooper (Crève-Cœur, La Fleche, and Houdans). *he*, J. H. MacBride (Crève-Cœur). 2, Mallinson, Genshill, King's County; A. McLean, Ballyvaughan (Crève-Cœur). *c*, J. Lupton, Chichester Park, Belfast (Houdans).

**HAMBROHS.**—*Gold or Silverspangled*.—1 and Cup, A. Robertson. 2, W. J. Davidson, Belmont. 3, L. Stone. *Gold or Silver-pencilled*.—1, W. G. Mulligan. 2, R. A. MacDonald.

**POLISH.**—1, J. K. Milner.

**GAME.**—*Black and other Reds*.—1 and Cup, J. C. Cooper. 2, C. E. M'Clintock, Glendarragh, Crumlin. *Any other variety*.—1, J. C. Cooper. 2, J. MacCormac, Belfast.

**BANTAMS.**—*Game*.—1, Cup, and 3, G. Hall, Kendal. 2, G. A. Perrin, Chantilly, Leamington. *Any other variety*.—1, R. H. Ashton, Mottram. 2, J. MacCormac. 3, T. M. Hillard, Clontarf. *c*, A. Robertson.

**ANY OTHER VARIETY.**—1, J. M. Wilson, Kilmarnock (Black Hamburgs). 2, J. C. Cooper. 3, G. Anderson (White Sulphur).

**DUCKS.**—*Toucan*.—1 and 2, W. G. Mulligan. 3, A. Robertson. *c*, R. P. Williams; E. T. Herdman; Mrs. Taaffe, Foxborough, Tulse. *Aylesbury*.—1, A. Robertson. 2, A. McLean. 3, R. P. Williams. *Any other variety*.—1 and 2, R. P. Williams. 3, J. Johnston, Kilmarnock. *c*, R. A. MacDonald (2); Mrs. Brennan, Pomeroy, County Tyrone.

**GESE.**—*Grey or Mottled*.—1, J. C. Cooper. 2, R. P. Williams. 3, W. G. Mulligan. *White*.—1, J. C. Cooper.

**TURKEYS.**—1, J. C. Cooper. 2, F. Watson, jun., Lurgan. 3 and *c*, Miss L. King, Geashill, King's County.

**SELLING CLASSES.**—*Cock*.—1, A. Robertson (Spanish). 2, J. Stuart (Dark Brahma). 3, E. T. Herdman (Coloured Dorkings). *he*, G. E. M'Clintock (Game); R. P. Williams (Dorking). *c*, J. Stuart (Dark Brahma); E. T. Herdman; J. MacCormac (Sebright Bantam); Mrs. Taaffe (Cochin). *Hens or Pullets*.—1, R. P. Williams (Dorkings). 2, J. MacCormac (Brahmas). 3, Mrs. Taaffe (Cochins). *he*, H. J. McBride (Crève-Cœur); Mrs. Taaffe (Dorkings); J. Stuart (Brahmas); Mrs. J. Firth (Brahmas); E. T. Herdman (Houdans); A. Field, Blackrock (Brahmas).

#### PIGEONS.

**POUTERS.**—*Blue or Black-pied*.—*Cock*.—1, Cup, and *he*, G. Wallace, Burnbank, Glasgow. 2 and 3, J. Huie, Glasgow. *he*, R. Fulton. *Hens*.—1, R. Fulton. 2, G. Wallace. 3, J. Huie.

**POUTERS.**—*Red or Yellow-pied*.—*Cock*.—1 and 2, J. Huie. 3, R. Fulton. *Hens*.—1 and Cup, R. Fulton. 2, G. Wallace. 3, J. Huie.

**POUTERS.**—*White*.—*Cock*.—1, R. Fulton. 2, G. Wallace. 3, T. J. McQuiston, jun., Belfast. *Hens*.—1 and 2, W. P. Montgomery, Belfast. 3, R. Fulton.

**CARRIERS.**—*Black*.—*Cock*.—1 and 2, J. Montgomery. 3, R. Fulton. *Hens*.—1 and 3, J. Montgomery. 2, R. Fulton. *c*, J. T. Purdon, Belfast.

**CARRIERS.**—*Dun*.—*Cock*.—1, Cup, and 3, J. Montgomery. 2, R. Fulton. *Hens*.—1, Cup, 3, and *he*, J. Montgomery. 2, R. Fulton.

**TUMBLERS.**—*Short-faced Almond*.—*Cock*.—1 and 3, R. Fulton. 2 and *he*, M. Stuart, Glasgow. *Hens*.—1, M. Stuart. 2 and 3, R. Fulton.

**TUMBLERS.**—*Long-bodied, any other colour*.—*Cock*.—1 and 2, M. Stuart. 3 and *c*, E. A. Seale, Kilmarnock. *he*, R. Fulton. *Hens*.—1, Cup, and 2, M. Stuart. 3, R. Fulton. *he*, E. A. Seale.

**BARBS.**—*Cock*.—1, R. Fulton. 2, 3, *he*, and *c*, W. A. P. Montgomery. *Hens*.—1, Cup, 1, 2, 3, and *he*, W. A. P. Montgomery. *he*, W. A. P. Montgomery; R. Fulton. *c*, J. T. Purdon; W. A. P. Montgomery.

**TRUMPETERS.**—*Black*.—*Cock or Hen*.—1, R. Fulton. 2 and 3, J. Frame, Comber, Co. Down. *Any other colour*.—*Cock or Hen*.—2, R. Fulton.

**JACOBS.**—*Cock or Hen*.—1, Cup, 1, and 2, J. Frame. 3, R. Fulton. *he*, E. A. Seale.

**FANTAILS.**—*Cock or Hen*.—1 and 3, E. A. Seale. 2, J. Waters, Belfast.

**TURBOTS.**—*Cock or Hen*.—1, Cup, 1, and 2, E. A. Seale. 3, R. Fulton.

**OWLS.**—*Cock or Hen*.—1, R. Fulton. 2, H. Purdon. 3, R. Stitt, Belfast. *he*, H. Purdon; R. Stitt; C. E. Staunton, Sandymount, Dublin.

**NUSS.**—*Cock or Hen*.—1, E. A. Seale. 2, J. L. Jamieson, Belfast. 3, A. H. Imrie, Ayr.

**JACOBS.**—*Common, including Beards and Balbs*.—1, Medal, and 3, J. Frame. 2 and Equal, F. Robertson. *he*, R. Stitt. *c*, R. Stitt; T. Read, Belfast (2); R. Fulton; A. H. Imrie.

**ANY OTHER VARIETY.**—*Cock or Hen*.—1, G. Wallace. 2, R. Fulton. 3, A. H. Imrie. *he*, E. A. Seale; J. K. Milner. *c*, T. J. Andrews, Comber, Co. Down.

**SELLING CLASS.**—*Cock or Hen*.—1 and 2, W. A. P. Montgomery (Trumpeters). 3, J. Frame (Jacobin). *he*, E. A. Seale (Almond); J. K. Milner. *c*, J. T. Purdon (Dun Favier); J. Frame (Barb and Jacobin).

**SELLING CLASS.**—*Pur*.—1 and 2, W. A. P. Montgomery (Barbs and Trumpeters). 3, J. K. Milner, Belfast (Jacobins). *he*, E. A. Seale (Barbs); W. A. P. Montgomery (Barbs and Trumpeters); T. Read (Fantails). *c*, G. F. Richardson, Lisburn (Barbs); J. Frame (Jacobins); W. A. P. Montgomery (Barbs); J. K. Milner; A. Corseaden, Belfast (Barbs).

#### CAGE BIRDS.

**NOBICIA.**—*Any variety*.—*Cock or Hen*.—1, 2, and 3, Misses E. & J. Baxter, Newcastle-on-Tyne.

**BELGIAN.**—*Yellow*.—*Cock*.—1, W. Gault, Monkstown, Whiteabbey. 2, J.

McConnell, Belfast. 3, J. McCalpin, Belfast. *he*, J. McKeown. *c*, J. & W. Stitt (2).

*Belgian*.—*Buff or Variegated*.—*Cock*.—1, J. McNab, Belfast. 2, W. Gaw. 3, J. McKeown. *c*, W. Gault; J. McCalpin; J. Brown. *Hens*.—1 and 3, J. & W. Stitt. 2, W. Gault.

*Scotch*.—*Yellow*.—*Cock*.—1, W. Gault. 2, J. McConnell. 3, T. Fox, Belfast. *he*, J. & W. Stitt; J. Gordon, Belfast. *he*, J. McDowell, Belfast; J. McNab; T. Fox; J. & W. Stitt (2). *Hens*.—Cup, 1, and 2, S. Croft, Belfast. 3 and *he*, J. McNab. *c*, J. & W. Stitt; J. Brown, Belfast; T. Fox.

*Scotch*.—*Buff or Variegated*.—*Cock*.—1 and *he*, T. Fox. 2, J. Cousins, Belfast. 3, S. Croft. *he*, J. McConnell; J. McKeown; J. Young, Belfast. *Hens*.—1 and 2, J. & W. Stitt. 3, S. Croft. *c*, J. McConnell; T. Fox.

ANY OTHER VARIETY.—1 and 2, Misses E. & J. Baxter. *he*, J. & W. Stitt. *he*, J. & W. Stitt. 3, J. & W. Stitt.

*Mules*.—1, 2, and 3, Misses E. & J. Baxter. *he*, W. J. Mulligan.

*Parrots*.—*Green or Grey*.—1, Mrs. J. M. Wilson, Kilmarnock. 2, J. L. Marshall, Knock, Belfast. 3, J. Frame.

*Macaw or Cockatoo*.—1, J. W. Crawford, Belfast. 2, Mrs. J. M. Wilson.

*British Song Bird*.—1, Misses E. & J. Baxter (Linnet). 2, J. Frame (Goldfinch). 3, J. Barlow.

*SELLING CLASS*.—1, J. McNab (Yellow Variegated). 2 and 3, J. & W. Stitt (Yellow Scotch and Variegated).

*JUDGES*.—*Poultry*: Mr. M. Leno. *Pigeons*: Mr. P. H. Jones.

*Cage Birds*: Mr. W. A. Blakston.

## NENTHEAD POULTRY SHOW.

THIS Show, held on the 8th, was a great success, for when it is considered that it is five miles from a railway station across a bleak country, it must be confessed that the Committee had no easy task before them; but when we arrived (half starved) we could not understand why everybody and everything seemed to be *en fite*. "It's pay week" says one; but that cannot account for it. At last we find out that there is only one pay week in the year, and that yesterday the lead company paid £5000 over the pay-table, and that this is the holiday week for the whole year. We found that the company had, at an expense of £3000, built a splendid school for the miners' children, and in this beautiful building the poultry Show was held, and truly there was, for such an out-of-the-way place, a grand collection got together.

First came *Game* with a really good Black Red first. In *Hamburghs* the first-prize pen were large, good Gold-spangles, honestly shown with a few white feathers. Singular to say, there was not a single entry of *Dorkings*, the climate being said to be too cold for them. The adult *Spanish* were a very good pen—large face, and good upright comb. The first-prize pen of *Brahmas* contained the best bird in the Show—a large, deep, short-legged, well-pencilled hen. In the class for a pair of hens the first prize went to a pair of *Houdans*, such as are rarely seen at our large shows. In *Ducks* a very large pen of Aylesbury were first, *Rouens* second. Of *Rabbits* there were only two pens, and these very poor. *Pigeons* the same; White Pouters first, Blues second.

[We hear from the Judge that this Show was to have been advertised in our columns, but the clerk, by mistake, sent the advertisement to another paper.]

*GAME*.—*Black-breasted and other Reds*.—1 and *c*, T. Brown, Donks Hall. 2, J. Stephenson. *he*, W. Walton, Cocklake. *Chickens*.—1, W. Walton. 2, J. Stephenson, Dykeheads. *he*, T. Brown. *he*, J. Walton, Alston. *c*, T. Brown; J. Stephenson.

*GAME*.—*Any other variety*.—1, T. Brown. 2, W. Walton. *Chickens*.—1, W. Walton. 2, W. Potts, Allendale Town.

*HAMBURGHs*.—*Golden-spangled*.—1, Rev. B. Robinson, Nenthead. 2, J. Richardson. *Chickens*.—1, J. Marshall, Kirkoswald. 2 and *c*, J. Dowson, Alston.

*HAMBURGHs*.—*Golden-pencilled*.—1, J. J. Millican. *Chickens*.—1 and 2, Cousin & Walton, Alston.

*HAMBURGHs*.—*Silver-spangled*.—1, J. J. Millican. 2, J. Richardson. *Chickens*.—1, J. Marshall. 2, J. Richardson. *c*, L. F. White, Alston.

*HAMBURGHs*.—*Silver-pencilled*.—1, J. Marshall. 2, J. Stephenson. *Chickens*.—1, J. Marshall. 2, J. Stephenson.

*SPANISH*.—1, T. Storey, Alston. *Chickens*.—1, T. Storey.

*BRAHMA* POOTRA.—1, 2, and *he*, J. Goodburn, Nenthead. *he*, S. Teasdale, Alston. *c*, R. Bell, Nenthead.

*BANTAMS*.—1, J. Bell, Barlaugh Mill. 2, E. Hymers, Hudgill.

ANY VARIETY.—*Hens*.—1 and *c*, Dr. Horder, Nenthead. 2, T. Brown. *he*, J. Walton. *he*, J. Marshall.

ANY OTHER PURE BREED.—1, J. Furness, Alston. 2, Dr. Horder.

*DUCKs*.—1, J. Kindred, Bayles. 2, J. Richardson.

*PIGEONS*.—1, W. Graham. 2, Cousin & Walton.

### CAGE BIRDS.

*CANARY*.—*Belgian*.—1 and 2, T. Brown. *he*, M. Stelling, Wellington.

*Yellow*.—1, J. Shield, Leadgate. 2, T. Brown. *Buff*.—1, J. Shield. *Yellow-marked*.—1, M. Stelling. 2, J. Stephenson. *he*, W. Rutherford. *Buff-marked*.—1, T. Brown. 2, W. Thompson. *he*, M. Stelling. *Green*.—1, R. Doyle. 2, M. Stelling. *he*, D. Homan, Alston; J. Robson; L. F. White; J. Shield. *Dun*.—1, J. Shield. 2, M. Stelling. *c*, J. Robson. *Best Couple*.—1, T. Brown. 2, J. Shield. *he*, W. Thompson.

*GOLDFINCH*.—1 and 2, J. Shield. *he*, W. Rutherford; M. Stelling.

*MULE*.—1 and *he*, J. Shield. 2, M. Stelling.

ANY OTHER VARIETY.—1, T. Brown. 2, J. Stephenson.

*RABBITS*.—1 and 2, W. Graham.

*JUDGES*.—*Poultry*: Mr. S. Burn, Whitby. *Cage Birds*: Mr. T. Lowrey, Gateshead.

MR. EDWARD HEWITT, of Sparkbrook, Birmingham, is most unwillingly compelled to announce that he cannot for the present

officialate as judge at poultry and Pigeon exhibitions. This arises entirely from personal indisposition, and is in compliance with medical advice.

## BLACKBURN PIGEON SHOW.

(From a Correspondent.)

THIS Show was held in the Exchange Hall, on the 9th and 10th inst. The entries were exceptionally large, numbering about six hundred, the quality of the birds excellent, and the whole arrangements very satisfactory, reflecting great credit on the Committee of Management.

*Carriers* were grand, the first and second prizes going to two well-known birds. *Hens* were very good, Mr. Fulton taking first with a splendid Dun, Mr. Horner being second with Black. The young Carrier class had twenty-six entries, and we have seldom seen so many fine birds. The first prize went to a grand Black from Mr. Yardley, Mr. Massey taking second; it was difficult to decide which was the better, for they were both nearly perfect.

*Pouter cocks* (Any colour).—Mr. Harvey here won first and cup with a fine Blue, Mrs. Ladd being second with White in grand condition. *Pouter hens*, any colour.—First, Black, sound in colour and slender in girth; second a good Red. The whole class was good, not an inferior bird in it.

*Barbs*.—Mr. Firth did not give other exhibitors a chance when he brought his champion Black cock, closely followed by two others, taking all three prizes and cup. *Hens*.—Here again Mr. Firth took first, Mr. Fulton coming in a good second. The whole class was highly commended. In young Barbs, as in the previous class, Mr. Firth took the three prizes. This is a class we should like to see done away with, for some of the birds are prodigies for their stated ages. A very highly commended Red hen should have been second, sound in colour and perfect in eye and beak.

*Dragoons* (Blue).—The judging of this class gave great dissatisfaction to fanciers of this noble bird, the first-prize being decidedly out of place, the bird having a light beak. We counted above a dozen superior birds in this class. *Dragoons* (Silver).—First and second wonderful birds. Red or Yellow. —Here Mr. Graham won first and cup with his splendid Yellow; Mr. W. Hill taking second and third with good birds in every point, but deficient in colour. White or any other colour.—First very good. Pen 187 should have been next.

*Tumblers*.—Our little pets, the Almond Tumblers, were a fine show. We have seldom seen so many and of such high quality. The first and cup were won by Mr. Yardley. Short-faced Tumblers (Any other variety).—The awards here were a little doubtful, but all colours competing there was room to differ. The Judges were evidently head-and-beak fanciers.

Our gems of the Show, the foreign *Owls*, do not muster in large numbers, there being only ten entries. Mr. Townson won easily with his champion cock, an exquisite White in spotless condition. The second was a Blue, and the third Black.

*Trumpeters*.—The prizes went to fine imported birds.

*Fantails* formed a large class, and there were some good birds, but with no motion.

*Jacobin cocks*.—The second-prize bird was small, neat, good in colour, and ought to have been first. *Hens*.—First a good Yellow, second Black, third Red. An excellent class.

*Maggies*.—Among these were many good birds of all colours and in fine condition.

*Nuns* were a good class, and many well trimmed.

*Turbits*.—Red or Yellow were very well judged. First a good bird, small and sound in colour. Any other colour.—The first prize went to a nice-headed Blue bird of Mr. Croft's. Second a bad Silver. There were several good Blacks in this class not noticed.

*Long-faced Tumblers*.—This class numbered forty entries. It is seldom we see so many and of such rare quality. Several were too near akin to the Short-faced to receive an award.

*Antwerps*, both Long and Short-faced, were a fine display, and must have puzzled the Judges; the prizes were well awarded. There were ninety-two entries in this class alone.

*Any other Variety*.—In this class, as usual, were many pretty birds. It is a highly interesting class, the colours and markings being so varied. First, a curious-looking little bird like a Blue Owl (Fried); second, Red Swallow; third, English Owl. We were surprised that the class for English Owls had been omitted in the schedule. It must have been an oversight of the Committee, for it is usually one of the largest in the catalogue, and too good to pass in the northern counties. We are sure there would have been a great muster of these elegant birds. In the Selling classes were several birds evidently entered to win the cup and readily claimed, for as soon as the judging was over we noticed sold tickets hung on the pens.

*CARRIERS*.—*Cock*.—1, G. J. Taylor, Far Town, Huddersfield. 2, E. Horner, Harewood, Leeds. 3, R. Fulton, Brockley Road, New Cross, London. *he*, R. Fulton; E. Horner. *Hens*.—1 and *he*, R. Fulton. 2, E. Horner. 3, J. & W. Towerson, Egremont. *Young*.—1, H. Yardley, Birmingham. 2, Master D.

Massey, Spalding. 3, E. Horner. *hc*, A. Billgeald, Nottingham; R. Fulton; J. Baker, Spring Grove, London, W.; W. Sefton, Blackburn. *c*, C. H. Clarke, Old Sneighton; R. Fulton; J. Stanley; E. Horner.

**POUTERS.**—*Cock*.—1, W. Harvey, Sheffield. 2, Mrs. Ladd, Caine. 3, R. Fulton. *hc*, G. J. Taylor; E. Horner; J. Baker. *Hen*.—1, E. Beckwith, Monkwearmouth. 2, W. Harvey. 3, F. W. Zuerhorst, Donnybrook, Dublin. *vhc*, G. J. Taylor. *hc*, Mrs. S. Ladd; R. Fulton; J. Baker. *c*, Major J. H. Cryer, Southport.

**BARBS.**—*Cock*.—1, 2, and 3, J. Firth, Dewsbury. *vhc*, E. Horner. *hc*, R. Fulton; J. Stanley, Salford, Blackburn. *c*, J. Firth; R. Fulton. *Hen*.—1, J. Firth. 2, R. Fulton. 3, F. Wild, Hyde. *vhc*, E. Horner. *hc*, G. J. Taylor; J. Stanley; E. Horner. *c*, T. W. Townson; R. Fulton. *Young*.—1 and 2, J. Firth. 3, J. Pearce, Binton-on-Trent. *vhc*, Major J. H. Cryer. *hc*, E. Beckwith; T. Charnley, Salford, Blackburn. *c*, J. Firth; R. Fulton (2).

**DRAGONS.**—*Blue*.—1, J. Guthrie, Hexham. 2, T. Charnley. 3, W. Harvey. *vhc*, J. Stanley. *hc*, W. Gamon, Chester; E. Horner; W. Sefton. *c*, W. H. Mitchell, Moseley, Birmingham; F. Graham, Birkenhead. *Silver*, any colour. *bars*.—1, J. Guthrie. 2, F. Graham. *hc*, H. Yardley; F. Graham; W. Sefton. *Red or Yellow*.—1, F. Graham. 2 and 3, W. Hill, Handforth. *vhc*, W. Hill; J. Ashworth, Blackburn. *hc*, W. A. Mitchell; W. Hill; J. Ashworth; H. Hesmondhalgh, Higher Eanam. *White*, or any other colour.—1, C. E. Duckworth, Watertree. 2, R. Robson, jun., Chester-le-Street. 3, A. A. Vander Meersch, Lower Tooting. *hc*, C. E. Duckworth; R. Fulton; J. Baker. *c*, J. Watts.

**TUMBLERS.**—*Short-faced.*—*Almonds*.—1 and Cup, H. Yardley. 2, W. Brydon, Dunse. 3, K. Fulton. *vhc*, W. Harvey. *hc*, H. Yardley; R. Fulton. *c*, C. E. Duckworth. *Any other variety*.—1, W. Walton, Burnley. 2, E. Beckwith. 3, W. Brydon. *vhc*, C. E. Duckworth. *hc*, E. A. Seale, Kilgobbin, Dublin; K. Fulton; H. Yardley. *c*, C. E. Duckworth; J. Fielding, jun., Rochdale; T. & W. Oddie; G. J. Taylor.

**OWLS.**—*Foreign*.—1, T. W. Townson. 2, E. Horner. 3, W. Lumb, Rochdale. *vhc*, F. Wild. *c*, F. Wild (2); J. Gardner.

**TRUMPETERS.**—1 and 2, W. Harvey. 3, J. Lederer, Bootle. *hc*, R. Fulton; E. Horner.

**PANTAILS.**—1, E. Horner. 2, A. Silvester, Sheffield. 3, E. A. Seale. *vhc*, J. Richmond, Oswaldtwistle. *hc*, J. F. Loverside, Newark; T. W. Townson. *c*, T. W. Townson.

**JACOBS.**—*Cock*.—1 and Cup, E. A. Seale. 2, T. Newell. *hc*, W. Lumb; T. Newell; W. Dugdale, jun., Burnley. *c*, R. Fulton; E. Horner. *Hen*.—1, W. Lumb. 2 and 3, E. A. Seale. *vhc*, J. Baker. *hc*, G. J. Taylor; A. A. Vander Meersch; J. Baker.

**MAGPIES.**—1 and 3, E. Horner. 2, C. G. Hitchcock, Townsland. *vhc*, T. J. Goodwin, Bucknell, Stoke-on-Trent. *hc*, J. B. Bowdon, Blackburn; R. J. Goodwin; H. Yardley; J. Richmond. *c*, J. B. Bowdon.

**NUNS.**—1, Cup, and *vhc*, E. Horner. 2, W. Hill. 3, A. H. Imrie, Ayr. *hc*, W. Croft, Killinghall, Ripley; J. Richmond.

**TURKITS.**—*Red or Yellow*.—1, E. A. Seale. 2, R. Fulton. 3, W. Croft. *vhc*, G. Hardy, Shepherd's Bush; S. Salter, Egrove. *hc*, G. Hardy; J. G. Orr, Beith; J. W. Edge, Erdington. *Any other colour*.—1, W. Croft. 2, J. Baker. 3, E. C. Stretch, Ormskirk. *hc*, W. Croft; A. Silvester; S. Salter. *c*, S. Salter; J. Baker.

**TUMBLERS.**—*Long-faced.*—*Almonds and Mottles*.—1, D. Riddiough, jun., Bradford. 2, E. Horner. 3, E. Beckwith. *vhc*, R. Fulton. *hc*, T. Newell, Ashton; J. Ford; W. Hill. *Any other variety*.—1, J. W. Harling, Burnley. 2, J. Dyce, Hexham. 3, R. Fulton. *hc*, A. A. Vander Meersch; W. Harvey.

**ANTWERPS.**—*Short-faced.*—*Cock*.—1, W. Gamon. 2, W. Ellis, Idle. 3, H. Yardley. *vhc*, W. Gamon; J. Gardner, Preston. *hc*, E. Horner; A. Lingham, Manchester. *Hen*.—1, W. Gamon. 2, H. Yardley. 3, W. Ellis. *hc*, W. Slater, Gravelly Hill, Birmingham; W. Ellis. *c*, F. Woodhouse, Blackburn; J. Stanley.

**ANTWERPS.**—*Long-faced.*—*Homing Birds.*—*Cock*.—1, H. Jennings, Alerton, Bradford. 2, J. Wright, Manchester. 3, W. Ellis. *vhc*, W. Gamon; Capt. G. Edwards, Hammersmith Mall. *hc*, A. Webster, Kirkstall, Leeds; C. F. England, Stroud; W. Ellis; H. Jennings. *c*, W. Ellis (2). *Hen*.—1 and *hc*, W. Ellis. 2, H. Jennings. 3, F. W. Zuerhorst. *vhc*, Capt. G. Edwards.

Mr. W. Ellis wins point Cup for Antwerps.

**ANY OTHER VARIETY.**—1, J. & W. Townson. 2, E. Horner. 3, F. Woodhouse. *vhc*, H. Yardley. *hc*, C. E. Duckworth; J. B. Bowdon; W. Hill (2); T. Charnley; H. Yardley (2); G. J. Taylor. *c*, W. Sefton.

**SELLING CLASS.**—*Single.*—*Not to exceed 30s.*—1 and Cup, W. Sefton. 2, E. Horner. 3, T. Pincock, Preston. *vhc*, J. Walker, Burslem. *hc*, P. R. Spencer, Hereford; J. Watts, Hazlewell Hall, Birmingham; J. Walker. *c*, J. Pearce; R. White, Manchester. *Pair.*—*Not to exceed £2.*—1, W. Sefton. 2, J. Guthrie. 3, E. Horner. *vhc*, W. Eubner, Spalding. *hc*, E. A. Seale; R. White; J. Ford, Monkwell Street, London; W. Hill; T. Charnley. *c*, J. Richmond; W. Sutcliffe, Burnley; W. Hill; C. G. Case, Spalding.

**JUDGES.**—Mr. T. Rule; Mr. H. Beldon.

## BIRMINGHAM COLUMBARIAN SOCIETY'S SHOW.

THE ninth annual Show was held at the Athenaeum Rooms, Temple Street, on the 8th inst. No less than 419 pens were exhibited. The following is the prize list:—

**CARRIERS.**—*Black.*—Cup and 1, F. Smith, Selly Oak. 2, H. Hallam, Lozells. 3, J. Watts, King's Heath. *Dun*.—1, 2, and 3, Capt. De Winton, Hereford. *Any other colour*.—1 and 3, J. Watts. 2, S. A. Cooper, Walsall.

**POUTERS.**—*Blue*.—1, J. Guthrie, Hexham. 2, A. H. Stewart, Birmingham. 3, R. Barrett, Stroud. *Black*.—Cup, 1, and 2, G. Holloway, Stroud. *White*.—Cup and 1, G. Holloway. 2 and 3, R. Pratt.

**TUMBLERS.**—*Almond*.—Cup, 1, and 3, T. Hallam, Lozells. 2, H. Adams, Beverley.

**TUMBLERS.**—*Short-faced.*—*Baldheads*.—1 and 2, W. Woodhouse, King's Lynn. 3, J. Watts. *Bards*.—1 and 2, W. Woodhouse. *Any other variety*.—Cup and 1, H. Adams. 2 and 3, T. Hallam. *hc*, H. Adams; T. Hallam.

**TUMBLERS.**—*Muffed*.—Cup, 1, and 3, J. Watts. 2, J. M. Bott, Acoek's Green.

**TUMBLERS.**—*Long-faced.*—*Clean-legged*.—1, J. Guthrie. 2, J. M. Bott. 3, J. Watts. *Bards and Bards*.—1 and 3, J. Watts. 2, J. B. Bowdon, Blackburn.

**JACOBS.**—Cup and 1, F. Smith. 2, W. Croft, Ripley. 3, W. E. Easton, Hull. **TURKITS.**—Cup and 1, E. T. Dew, Weston-super-Mare. 2, W. Croft. 3, J. W. Edge, Erdington.

**BARBS.**—Cup, 1, and 2, F. Smith. 3, E. Thompson.

**NUNS.**—Cup and 1, J. Watts. 2 and 3, W. Croft.

**OWLS.**—Cup and 1, J. Watts. 2, W. Ridley. 3, J. W. Edge.

**DRAGONS.**—*Blue*.—Cup and 1, W. Gamon, Chester. 2, F. Graham, Birkenhead. 3, J. Watts. *Silver*.—Cup and 1, F. Graham. 2 and 3, H. Allsopp. *hc*, F. Graham; J. W. Ludlow. *Yellow and Red*.—Cup, 1, and 3, F. Graham.

2, J. Watts. *White*.—Cup and 1, J. G. Dunn, Newcastle-on-Tyne. 2, F. Graham. 3, J. Watts.

**ANTWERPS.**—*Dun*.—Cup and 1, W. Gamon. 2, J. W. Ludlow, Birmingham. 3, C. F. Copeman, Birmingham. *hc*, J. W. Ludlow; J. Phelps; C. F. Copeman.

*Blue*.—Cup and 1, J. Watts. 2, J. W. Ludlow. *Blue Chequered*.—Cup and 1, G. 1 helps, Lozells. 2, 3, and *hc*, J. W. Ludlow. *Red Chequered*.—Cup and 1, H. K. Wright, Birmingham. 2, C. F. Copeman. 3, J. W. Ludlow.

**WAGTAILS.**—Cup, 1, and 2, J. B. Bowden. 3, J. Watts.

**SWALLOW.**—1 and 2, J. Watts.

**ANY OTHER VARIETY.**—1, M. Ord, Durham. 2 and Cup, J. Watts. 3, J. W. Ludlow.

**CARRIERS.**—*Black.*—*Cocks*.—1, H. Hallam. 2, F. Smith. *Hens*.—1, F. Smith. 2, H. Hallam. *Any other colour.*—*Cocks*.—1 and 2, J. Watts. 3, S. A. Cooper.

*Hens*.—1, S. A. Cooper. 2, J. Watts. *Dun.*—*Hens*.—1 and 2, H. Hallam.

**POUTERS.**—*White.*—*Cocks*.—1, H. Pratt, Knowle. *Hens*.—1 and 2, H. Pratt. *Any other colour.*—*Cocks*.—1 and 2, H. Pratt. *Hens*.—1, A. H. Stewart. 2, H. Pratt.

**TUMBLERS.**—*Almond*.—1 and 2, T. Hallam. 3, H. Pamphilon, Stokenpon-tent.

**TUMBLERS.**—*Short-faced.*—*Bards*.—1 and 2, W. Woodhouse. 3, J. W. Edge. *Bards*.—1 and 2, W. Woodhouse. *Any other variety*.—1 and 2, T. Hallam. 3, J. Watts.

**BARBS.**—1, F. Smith. 2 and 3, H. R. Wright.

**OWLS.**—*English*.—1 and 3, G. E. Sawdon, Leeds. 2, S. A. Cooper.

**PANTAILS.**—1, J. W. Edge.

**JACOBS.**—Cup, 1, and 2, W. T. Breeden. 3, W. E. Easton.

**TURKITS.**—Cup, 1, 2, and 3, E. T. Dew.

**NUNS.**—1, W. E. Easton. 2, J. Watts. 3, S. A. Cooper.

**MAGPIES.**—1, J. Watts.

**DRAGONS.**—*Long-muffed.*—Cup, 1, and 2, G. Phelps. 3, J. Watts. *Long-faced.*—*Clean-legged*.—1 and 2, J. M. Bott. 3, J. Watts.

**DRAGONS.**—*Blue*.—1, H. Allsopp. 2, J. Watts. 3, W. Gamon. *Silver*.—1, F. Graham. 2 and 3, H. Allsopp. *Red or Yellow*.—1, F. Graham. *White*.—1, F. Graham.

**ANTWERPS.**—*Dun*.—1 and 2, T. Cinlee, Birmingham. 3 and *hc*, W. Gamon. *Blue*.—1, W. Gamon. 2, J. W. Ludlow. *Blue Chequered*.—1, 2, and 3, J. W. Ludlow. *Red Chequered*.—1, W. Gamon. 2, G. Phelps.

**ANTWERPS.**—*Cocks*.—1, S. Foster. 2, J. W. Ludlow. 3, J. Watts.

**ANY OTHER VARIETY.**—1 and 2, J. W. Ludlow. 3, J. Watts. *hc*, M. Ord; J. W. Ludlow (2).

**ANY OTHER VARIETY.**—*Single*.—1, M. Ord. 2, J. Watts. 3, J. W. Ludlow. *hc*, A. H. Stewart; J. W. Ludlow (4); G. E. Sawdon.

**ANY VARIETY.**—*Single*, except those in which single birds are shown.—1, T. Hallam. 2, F. Smith. 3, H. Pamphilon.

A cup for best single bird in the Show.—H. Pratt (Pouter Cock).

A cup for best pair of birds in the Show.—W. Woodhouse (Short-faced Bald-heads).

**JUDGES.**—Mr. F. Esquilant, Effra Road, Brixton. *Flying Tumblers.*—Mr. D. E. Careless, Aston.

## PIGEON NOMENCLATURE.

I NOTICE your reporter's reply in last Thursday's issue. As I was not present at Glasgow I am unable to state how I should have described the colour of the young Carrier in pen 77. I endeavoured to point out that the term "silver dun" means "bad-coloured dun," and nothing else. The terms "dun" and "silver dun" are used indiscriminately by Antwerp breeders to indicate the colour generally called "mealy," or "ash-mealy." As neither dun nor silver is allowed to colours of these birds, no confusion is occasioned by speaking of a dun or silver dun bird as long as such a Pigeon is an Antwerp; but as soon as the appellation "silver dun" is used to indicate the colour of a Pigeon belonging to a breed in which the colours dun and silver, or either of them exists, it becomes a very vague term.

If "silver dun" were not employed to denominate a colour other than the colour which it really means, I should know that your reporter wishes to state "that the colour of the Pigeon in pen 77 was bad-coloured dun." I have seen Silver Dragons called "Silver Dun Dragons" in this Journal. I wish, therefore, to point out to your reporter that I do not understand whether he has fallen into either of the errors of calling either a mealy or a silver Carrier a "silver dun," or whether he wished to state "that the young Carrier in pen 77 was a bad-coloured dun, and that it should have been entered in class 12."—TURKEY QUILL.

## THE NORTHAMPTON RABBIT SCHEDULE.

THE Northampton Rabbit Show will soon be here again, and although the schedule is not so complete as last year's was, yet we hope it will meet with the same success, for it will be well remembered that never before was so good a collection of Rabbits brought together.

This year Northampton has nine classes—one less than at the last Show, that for weight being omitted, we are sorry to say (probably on account of the scarcity of entries then), for the prizes of this class are the only encouragement fanciers have to feed Rabbits. In still continuing to allow only two classes for Loops, Northampton, in my opinion, is wise; for if it cannot afford a class for each colour, it is right in refraining from giving more. The Angoras have more allotted to them than any of the others, having a cup to themselves besides the usual prizes. I expected to see a class for Belgian Hares and Patagonians, exclusive of the Any other variety one, but am disappointed this year, yet hope it will be thought of at the next meeting.

It is pleasing to find that the Local class is not omitted, for this was exceedingly well filled last year, and no doubt will be so this, for Northampton is known to possess many ardent fanciers. The entry fees are low, and "the exhibits will be judged the day before the Show opens," thus giving the Judge, who is a gentleman highly capable, more time to award the prizes.

Although Northampton has somewhat stinted the cups in comparison with last year, we must not forget that these are generally subscribed for, and that the subscriptions, it appears, being few, accounts for the decrease. It is quite evident that if fanciers wish for good prizes and a number of classes, they must support the Show with their purses, which, it may be remarked, they do not to the extent they should.

Before concluding, the following improvements might be made for the future:—That the restricted price (20s.) of the Selling class be raised to at least 30s., as it is well known that a thoroughly good Rabbit cannot be bought for the former; that the second and third prizes be of greater value, even if this has to be deducted from the first one, and I repeat what was said before regarding the class for Belgian Hares and Patagonians.

Taken altogether, Northampton is still worthy of being one of our leading exhibitions, if not the leading one; and I sincerely hope that fanciers will support it with large entries now, and next year with greater and more numerous subscriptions and gifts for extra prizes and classes.—R.

### BEE PASTURAGE.

As "C. H. E." and others are anxious to obtain a complete list of plants that yield honey, it will be well to consider the subject in a longer notice than is generally admitted into the "Letter Box." Dr. Watts, in his beautiful hymn, has spoken of the busy bee gathering "honey all the day from every open flower." I should like to hear the word "many" used instead of "every," for there are hundreds of flowers and plants which do not produce honey.

It is beyond the powers of the best informed mind to name every plant and flower found in this country which yields honey. Bees have been seen at work on the dock, daisy, and dandelion in places and times of scarcity; yet no writer, probably, would venture to put these in the list of honey-producing plants. Of these the following list contains the most valuable, and also some that are of comparatively little value to bees.

Winter Aconite.

Tussilago.

Rosemary.

Crocus.

Willow.

Osier.

Hepatica.

Violet.

Veronica.

Cyanus (Blue-bottle).

Syringa.

Hyacinth.

Almond.

Borage.

Single Wallflower.

Apricot.

Gooseberry.

Peach.

Plum and Cherry.

Pear and Apple.

Currant.

Raspberry.

Ramblerberry.

Mignonette.

Laurel.

Hazel.

Turnip.

Cabbage (all the Brassica tribe).

Broom.

Gorse or Whin.

Berberis.

Sweet Briar.

Ribes sanguineum.

Mallow.

Maple.

Sycamore and Plane.

Lime.

Bean.

Field Mustard (*Sinapis arvensis*).

Bird's-foot Trefoil (*Lotus corniculatus*

and major).

St. John's-wort.

Honeysuckle.

Buckwheat.

Hyssop.

Nasturtium.

Viper's Bugloss.

White Clover.

Hollyhock.

Heliotrope.

Thyme.

Ivy.

*Melilotus leucantha*.

Heather (Heaths of all kinds).

In early spring crocuses, border hyacinths, single wallflowers, some kind of willows (*Salix*) are welcomed and much visited by bees, and it is believed all of them yield both honey and pollen. Then follow the flowers of the gooseberry, cherry, plum, pear, and apple, all of which are rich in honey of exquisite flavour. Before the apple blossoms fade the sycamore produces its flower, which is scarcely equalled for the abundance and richness of the honey it produces. In this country honey is not distilled (does not drop) from the flowers of the sycamore tree, but it literally lies on them, and is clammy to the hand. The sycamore continues a long while in flower, filling up the interval between the fall of the fruit-tree blossoms and the blooming of the white clover. Field beans flower about the same time—rather later, perhaps, than sycamores, and furnish bees with large supplies. Field mustard, which is a weed covering many a corn field in some parts of the country, flowers about the same time as field beans. It, too, yields large supplies of honey, which speedily crystallises. In Yorkshire and Derbyshire this plant is called Ketlock; in Lanarkshire it is called skellock; in Wigtonshire it is termed ranches; and here, in Lancashire and Cheshire, it is called the yellow weed.

The reader may be interested to know that no two kinds of plants produce honey alike. White clover is in this country the queen of honey plants. It continues a long time in flower, and yields a large quantity of rich transparent honey of excellent flavour. It is, perhaps, one of the most sensitive of our honey plants—sensitive, I mean, to the change of weather, and produces but little honey in the face of an east wind. Even mignonette,

which is a great favourite with bees, is not so easily affected by cold weather as white clover. Red clover is doubtless a honey plant, but its petals are too deep for the proboscis of the honey bee. It cannot reach the receptacles of honey at the bottom of the petals. This remark applies also to flowers of beans, but these are tapped or pierced at their bottoms, just opposite the honey-nectar, and through these pierced holes the rich treasure of bean flowers is extracted. It is a question whether the flowers are tapped by humble bees or our own little workers.

There has been so much written about bees on the moors and heather honey that I need not add much here. Heather comes into blossom about the beginning of August, and continues to flower for a month or five weeks. Very large harvests of honey are obtained from the moors. Some hives of bees gather 50 lbs. and upwards in three weeks from the tiny blossoms of heather. The moorland honey differs greatly in taste and appearance from all other kinds obtained in Great Britain. Some English gentlemen like it; but the English palate, generally speaking, prefers the milder honey gathered from fruit trees, sycamore, and clover. Heather honey is largely produced and highly esteemed in Scotland.

The honey seasons of Great Britain may be divided into three periods—viz., 1st, April and May; 2nd, June and July; 3rd, August. The fruit trees are the great honey-producers during the first period; for the second we have sycamores, beans, field mustard, limes, and white clover. There are dozens of honey plants flowering at this season, but they are unimportant compared to those named. Lastly comes the moorland heather, so valuable to the bee-farmer.

One or two hints will be enough for the intelligent reader. The first is to endeavour to have strong hives of bees in spring ready to gather the honey so abundantly produced by fruit trees. The hives of many bee-keepers are so weak in spring that little advantage is gained from our orchards, whereas those who keep large hives and manage them better often find their hives increase daily in weight from 2 lbs. to 5 lbs. each in fine weather during the first season of honey-gathering. The story of the value of strong hives has never been told, neither is it possible to describe the industry of the honey bee.

Borage, mignonette, and *Centaurea Cyanus* are three annuals whose flowers are very rich in honey, and "C. H. E." cannot have too much of these in the vicinity of his apiary.—A. PETTIGREW, *Sal.*

### BEEES IN 1874.

SEVERAL of your staff or other correspondents have been forward in giving us their benediction this new year in the matter of flowers, and poultry, and Pigeons, &c. Let not us bee-keepers be behind in wishing each other health and prosperity, and our insect friends great encouragement and success in the main business of their lives. This business consists in two important things—first, the maintenance of their race and its multiplication; secondly, as a means to that end, the harvesting in its proper season of what is to them "the staff of life"—namely, honey of excellent quality and in good abundance. Be it so. Our disappointments have been great in this last respect. May both the farmer and the bee-keeper have reason to speak of the whole of Great Britain as a "land flowing with milk and honey!" That the two products thus connected together in the language of the Bible are with good reason coupled together has been remarkably shown this last season, because both milk and honey have been together less abundant than usual; and I believe, as I have stated before, from the same cause—namely, the excessive saturation of the soil by the unusual rainfall of last winter, and the great deficiency of sun-power throughout the spring and summer. No weather-augury can be otherwise than a more or less fortunate surmise; but we may reasonably hope that in this respect 1874 will be widely different from 1873. Certainly, no deficiency of honey next summer can be put down to an excessive rainfall this winter. It has been splendid hitherto.

Apart from the question of honey and the proper increase of our apiaries, there is another matter in which we may look forward to 1874, from our point of view, with much interest and hopefulness. There is likely to be a grand display of apian paraphernalia and a show of hives and honey in the Crystal Palace some time next autumn; nor will the year close without the formation of some sort of national society of apiculture, to which we cannot otherwise than heartily wish well. In due time these matters will be brought before us. Perhaps, also, something like decisive knowledge will be gained in reference to certain things which cannot yet be said to fall within our actual observation. The question "What is honey?" may be solved in this year of grace, if Mr. Pettigrew and his co-religionists will but verify their surmises. Indeed, your correspondent, "A SOUTH LANCASHIRE BEE-KEEPER," would seem to have solved it already: for does he not tell us he has "found it out by accident"... and "exactly as described?" No one can fail to see the immense value and importance of such a discovery;

for will it not place us apirians in a position to defy the season, and to produce honey of any quality and any flavour at will and almost at any moment's notice, as well in midwinter as at mid-summer? May we not hope, too, that an effectual stop will be put to that miserable system which sees a cow's tail in a pump-handle, against which our old friend "A RENFREWSHIRE BEE-KEEPER" protests with such righteous force of language? So when our last Christmas chimes were pealing forth their merry strains, may we not hope that with some kind of prescience they were ringing out the false and ringing in the true in our little world as in larger spheres? Let us hope that no one of our guild in THE JOURNAL OF HORTICULTURE will soil his hands this year with any transactions, such as are justly condemned by the last writer I have named—least of all any member of our most honourable craft in the speciality we love.—B. & W.

### IS HONEY RE-SWALLOWED BY BEES?

The best proof I have that honey does not require re-swallowing and disgorging (and your readers can judge for themselves), is, that I have watched over and over again the bees as they came from the fields with their honey, and where they had no chance of deceiving me, and have seen them commence to fill and seal the cells without ever re-swallowing it. I believe bees have the power of extracting the excess of water from honey the moment they swallow it. As soon as this is done the honey gradually becomes thicker.

Since the foregoing was written I have read Mr. Pettigrew's article (see page 359 of last volume), and ask how the bees go to work, and how they manage to re-swallow the honey stored in the super, where he says, "Fix a few pieces of empty white comb in a super as already described, and then place it over the empty hive; in less than ten minutes' time the bees will be in the super and readily commence work." Knowing what bees can do under these circumstances, I fail to see how they will follow out their instincts, and at the same time re-swallow all the honey carried into the combs and have a super finished as it ought to be in the time specified by Mr. Pettigrew. In fact, he has here proven that bees do not re-swallow honey.

I have also read with some degree of astonishment both "B. & W.'s" and Mr. Pettigrew's mode of feeding. I cannot see how their bees fail to take food quickly enough from the bottle, the best of all feeders. I find there is no difficulty in a good stock of bees taking down 4 lbs. in twelve hours; and according to Mr. Pettigrew's instructions, if 15 lbs. are sufficient from September till March, it cannot be said that to take that amount in four or five days is a tedious operation. But why such a fuss about feeding bees so hurriedly? From 1 to 2 lbs. daily is a quick-enough rate to administer sugar to bees. And let me here warn the readers of this to be very careful in giving bees sugar in large quantities at once, thereby overheating the hive; also to beware of pouring 2 lbs. of sugar at a time on a hive of bees, on account of the fighting it will cause among the inmates, besides so clogging many of their wings that they cannot fly.—A LANARKSHIRE BEE-KEEPER.

### OUR LETTER BOX.

POULTRY JUDGE (D. W.).—Mr. Burn's fitness for the office is well known and needs no further advocacy.

TIME FOR SETTING COCHINS AND BRAHMAS (W. W.).—We consider this the best time if you wish to breed prize birds. The earliest chickens are the easiest to rear if you have a large barn or outhouse with an earthen floor in which to keep the chickens during the first six or seven weeks. They require protection from rain, sleet, draughts, and cutting winds; they also want to be warm during the long nights of midwinter. There is no such thing as a first-class Black Bantam cock with a red earlobe. It should be quite round and smooth, with a dead white surface.

PRODUCE OF EGGS (C. L. M.).—If from forty-five hens you are now getting six eggs per day, you are going on very well, and producing above the average. You may look now for a daily increase. It has hitherto been one of the worst laying seasons on record. We cannot understand why you keep such a medley lot of birds. Having only fifty or sixty, with farm and stack-yard for them to run in, we think it would be much better if you confined yourself to one breed—say Dorkings or Brahmas; but from the description you give, it should be the place of places for a Dorking run. We are not friendly to crosses, but we particularly object to a mixture of sitting and non-sitting breeds. The hens you have laying now are probably those one year old. Where eggs are much wanted we should never keep hens more than two seasons. We do not hold with allowances of food, as the need cannot be always the same. For instance, where threshing is going on there is the barn-door scratch, and fowls never do so well as when they have it. At those times as much food is not required as at others. Fowls should be fed according to their requirements, and these are much greater at some times than others. In the summer they, like ourselves, require less food, and in the winter more. If, then, one undeviating rule of feeding be adhered to, half the food will be wasted in the summer, and the fowls will be half fed in the winter. Eight o'clock in the morning is too late for the first meal; they should at this time of year be fed at daybreak. They have then been fasting from fourteen to fifteen hours; this is much against laying and condition. If inconvenient, some food may be put in their runs overnight. Supposing that, as in most farmyards, there is always some food to be had, we will say let the birds be fed at daybreak with corn, not oats (except the Ducks and Geese); at mid-day let them have the house scraps, and at evening another feed of corn. The pulped manure amounts to nothing, and may be omitted without injury or detriment. The man in charge must vary this at discre-

tion, taking care the birds are always sufficiently fed. We will undertake to say there will be an increase in the number of eggs, and no increase in the consumption of food. Mince may sometimes be given for a change.

EGG-PRODUCING FOWLS (Welly).—You may choose among Spanish, Crève-Cœurs, and Huitans. They are the best. If you will tell us the nature of your run, we shall be glad to advise you further.

EGGS (A. Young Farmer).—We know of no reason for doubting the honesty of the person you inquire about. Mr. Wright's "Illustrated Poultry Book" contains the characteristics.

VARIOUS (J. G. W.).—We answered some or all your queries. Mr. Wright's "Illustrated Poultry Book" is the best. The Canary we do not remember.

REMOVING BEES FROM THEIR HIVE (A. Young Apirarian).—We cannot endorse the plan recommended by "AN OLD MAN" of taking bees from hives, and prefer the other modes usually adopted by practical bee-keepers—viz., driving or shaking them out. The driving may be done in about fifteen minutes, and when the bees are sitting loosely amongst the combs they could be shaken out in less than one minute. The straw hive should be nearly full of bees before this work is done, say about the end of April, and even then the brood would have to be sacrificed and a loss sustained. By attention to the straw hive you may have it ready for swarming by the beginning of May, when the swarm could be introduced to the bar-frame hive, and three weeks afterwards all the bees could be driven out of the straw hive into another bar-frame. Thus you would have two bar-frame hives and the honey in the old straw hive. We think no other way of compassing the end you have in view so eligible as this.

TAMING WASPS (Mariana).—Of what use would it be? The following from a contemporary is applicable—"What Sir John Lubbock has to be answered for if old maids as a body take to this interesting study may happily be more readily conceived than felt. A correspondent writes: Encouraged by the success of Sir John Lubbock with the solitary wasp of the Pyrenees, three sister spinsters residing under the shadow of Durham Cathedral have been endeavouring to tame a few of the British species. The result is unsatisfactory. One of the sisters has a large patch of powder-blue over the left eye, another has her right arm in a sling, and the third, the doctor thinks, will be able to drive out in a week. The wasps were liberated."

### REMARKS.

7th.—Fine all the morning and noon; rather less so in the afternoon, but fine night.

8th.—Rather dull early; slight rain at 11 a.m., and showery after; windy at night.

9th.—Wet morning; showery and uncomfortable all day.

10th.—Dull though fair morning; showery before noon, but fine afterwards.

11th.—Fine morning; fair all day, but not bright; slightly foggy.

12th.—Rainy morning, and dull all day.

13th.—White frost in the morning, followed by a beautiful day; bright and clear.

Weather very similar to that of the two previous weeks, but more pleasant, owing to the absence of the fogs with which they had been accompanied.—G. J. SIMONS.

### COVENT GARDEN MARKET.—JANUARY 14.

From observations taken near London during forty-three years, the average day temperature of the week is 44.0; and its night temperature 31.9°. The greatest heat was 56°, on the 25th, 1816, and 27th, 1861; and the lowest cold 15°, on the 23th and 27th, 1855. The greatest fall of rain was 0.90 inch.

## THE POTATO DISEASE.

UPON my mind the impression produced by the perusal of the paper on this subject in connection with Earl Cathcart's prize was one of surprise and disappointment. That ninety-four essayists should prove to be a set of mere theorists, and nothing more, upon such a subject, is perfectly astounding. What are those of us about who claim to be practical men? Suppose we try to bring the total up to a hundred by means of a few papers in the Journal, and see if the plain clear teachings of actual practice do not prove so solid and weighty as to more than counterbalance the light superficial evidence of mere assertion.

The Potato disease is a stern reality, a decided and an accepted fact, and in seeking for the best means where-with to combat its evils it appears to me that there are only two points upon which to base our calculations, and these are—1, The disease can be cured; 2, The disease cannot be cured. To the first I answer without the slightest hesitation—Wrong; and to the second—Right; for I am convinced that more good would be done, and much waste of time and money avoided, if, instead of seeking for an actual remedy, or trying to get rid altogether of the disease, the attention of the investigators were directed to superior means of culture; to the selection of sorts of rapid growth, early maturity, and which, besides keeping sound and good till new Potatoes are abundant, shall also continue in excellent condition for culinary purposes from the time of lifting in August till the following June, or about ten months. This is no impossible novelty—no crude theory, but is already a reality. We have not even to seek for or to raise varieties possessing such desirable qualities, having more than one of such already in our hands, and the variety which may be taken as a type is that fine Potato Paterson's Victoria.

Blight-proof Potatoes are a fallacy. It is true enough that certain kinds yield more slowly than others to the attacks of the disease, but it is equally true that all kinds, new and old, succumb, without exception, to it. It is not my purpose to indulge in hostile expressions respecting any nursery or seed firm, but I must not refrain from stating that so-called blight-proof sorts have been procured direct from the raisers, and failed in every instance to justify them in offering such kinds to the public as disease-proof. I shall indeed be greatly surprised if any one be found who will venture to submit any of the varieties said to possess this merit to such a crucial test as the Royal Agricultural Society's Judges very wisely recommend, being convinced that the trials will serve only to establish the truth of what is already a recognised fact with most practical men—namely, that no Potato is disease-proof.

When the Fluke Kidney was first sent out it was supposed that, besides the excellent qualities which rendered it superior to all late-keeping sorts of that day, it possessed

the extraordinary merit of being blight-proof. I was serving under my father at the Earl of Romney's at that time, and retain a lively remembrance of the excitement which it caused, how eagerly it was watched, and how great the disappointment proved when it failed to answer our expectations. Well, this sort of thing has been going on ever since, and I have had most of the later introductions through my hands with invariably the same results; and no later than the past season I was tempted to procure a variety not altogether a new one, but which had repeatedly been brought before the public as a blight-proof sort. The result was really curious, for it proved to be the only kind that suffered much from blight, quite a third of its tubers being affected!

Upon examination of what are asserted to be the causes of disease, two only appear to me to afford matter for profitable discussion. The first, and perhaps the most important on the list, is "Degeneration of the tuber," and the remedy recommended is the use of new sorts for planting. If one could accept the proposition that degeneration of the tuber is the cause of disease, would not the question immediately arise, How can so costly a remedy be applicable in the case of those who grow Potatoes for the markets? It would, I think, be found altogether impracticable for commercial purposes. What would the Potato-farmers of Lincolnshire say if they were invited to discard their standard sorts, and to invest capital in the purchase of comparatively untried varieties?

Now, degeneration of the tuber whenever it occurs almost always arises from the improper treatment of the seed, and the recurrence of such an evil may, therefore, easily be avoided. If seed Potatoes are heaped together in large quantities, and suffered to remain so during winter, and to put forth long weakly sprouts, the loss of tissue and stamina must be very considerable, as is clearly evinced in the weakly uncertain growth, and frequent failure to grow at all, so often seen. The remedy for such faulty practice is obvious. As each crop is lifted, select the seed with care, spread it thinly in the store-house, examine it frequently, and before there is any risk of sprouting put the whole of them in single layers on end, side by side, eyes upwards, upon trays or shelves. Do not plant before the soil is in good condition, then carry the seed to the drills, and plant so carefully that the short, thick, sturdy sprouts, with which the tubers will then be bristling, sustain no damage. Stir the soil well between the rows, earth-up slightly, and the quick even growth, but more especially the great produce and early maturity of the crop which will certainly follow if the kinds be well selected, will afford such ample remuneration for this careful tending as to convince the most sceptical of its value and importance, not only for gardens, but for the most extensive system of field-culture. I have applied this method of preparing the seed in my own practice for several seasons, and am so thoroughly convinced of its importance, as to very safely venture to assert that, combined with skilful timely culture and promptitude in taking up the crop, it enables one not only to escape the attacks of disease, but to obtain a mean

product of nearly double the bulk of that of the principal Potato districts in the past season.

This brings me to the other given cause of disease—wet weather and generally superabundant moisture. There can be no doubt that this is the primary cause of disease, and none of the methods of prevention given are of the slightest use as a preventive. It is an evil which we may avoid, but we cannot grapple with successfully if we wait its coming. The time when the crop first sustains damage from a superabundance of moisture is generally about the last week in August, sometimes a little earlier; but by cultivating those kinds only which have been very aptly termed “early-ripeners, late-keepers,” the entire crop is always matured, lifted, and stored securely before the fatal rains occur. It is notorious that disease was generally very prevalent last autumn, increasing in virulence as the season advanced. By pursuing the method of culture which I advocate I was enabled to lift and convey to the storehouse the whole of the main crop in excellent condition by the evening of August 16th; thus saving it from the effects of the unkindly weather which so quickly followed. The valuable and interesting reports from all parts of the country of the condition of the Potato crop, which were published in the Journal in August and September, showed clearly what complete success attends intelligent culture wherever it is followed. From Dorsetshire, Worcestershire, Hampshire, Essex, and Sussex the crops were reported to be in the storehouse on the 28th of August sound in condition and excellent in quality. Long after this—late in October—Potatoes were being taken up even along the south coast, and they were, of course, badly diseased. Can it possibly be necessary to point the moral?—EDWARD LUCKENRUST.

#### NOTES BY THE WAY.

WHEN I left London on the second day of this new year on a search for health in the favoured climes of the “sunny south,” the thermometer stood at 50° F., the birds were singing as if it was spring, and the rooks, mistaking the unusual season, had begun to build. My first rest was at Boulogne, and the weather now became cold and wet, so that when I reached Paris the great thermometer in the court of the Hotel du Louvre registered 42° F. The next morning the streets of Paris were bound with frost, and I was glad to hasten from a state of things which I had already endeavoured to avoid at home. The sun was powerful about Paris, and the days were warm and spring-like, though the mornings were frosty; but by the time I reached the rich region of the Côte d’Or the little hills and vineyards were covered with snow, and on arriving at Dijon I found the ancient capital of Burgundy bound hard in a black frost.

I merely mention these facts for the information of those of your readers whose ideas may hitherto have been at variance with them, and who think that the farther south they go the warmer it becomes. I only wish it had been so in my experience. At Dijon my stay was short, on account of the cold, though there is much to be seen in that interesting old city. But it was not the wars and strifes of the Dukes of Burgundy, the historical edifices, nor the *crus* of the Côte d’Or (and they are very choice), which had their attractions for me. I rather, notwithstanding the ungardening time of the year, turned my attention in that direction to search out what I could find.

There is at Dijon an academy composed of a faculty of Literature, one of Science, and one of Law; a school of medicine and surgery, a hospital, and a school of art. In connection with this there is also a botanic garden, situated on the opposite side of the railway from the town, of which Dr. Lagneuse is the Director, and M. Weber the Curator. It is a small affair of from 3 to 4 acres, but it contains a very good collection of herbaceous plants, arranged upon the system of De Candolle, and all very carefully labelled. The labels are worth imitating in our own botanic gardens. They are small square plates of iron, raised on a long iron stem  $2\frac{1}{2}$  feet high from the ground, so that the name is brought near the eye, and feeble backs and stiff knees are not distressed by having to stoop close to the ground to read the name, as is too frequently the case in public gardens. Some idea of the extent of the collection may be formed when, by way of test, I counted the number of species of Clematis, and found there were eighteen. I believe the garden contains five thousand species in all.

In the corner of the garden is a piece of ground raised arti-

ficially to represent a small hill, and on this is planted a collection of Vines, extending to three hundred varieties, consisting chiefly of those employed in the various wine-growing districts of France. I remarked in this garden an ingenious contrivance to enable them to grow Ferns in a situation where shade could not be obtained, and where, in a country like this, in which the summers are so hot, shade is more essentially necessary. It consisted of a shelter covered with laths, placed about half an inch apart, effectually shading the plants, at the same time light and rain are not excluded. I cannot do better than supply you with a sketch of it, which will convey more vividly the thing to the mind. It is 5 feet 6 inches high in front, and 4 feet at the back, and the width is 2 feet

Fern Shelter.

3 inches. The laths are about an inch wide, and half an inch to five-eighths apart. Those at home who are troubled to procure shade for those plants that require it may take a hint from the garden at Dijon, and, perhaps, improve upon the suggestion. A small stream runs through the garden, on which some sagacious-looking old swans alternate their movements with the garden, where they march in a stately line, regarding on either side the possibility of securing a slug or a worm.

It is not only as a botanic garden that this establishment is kept up. Gardening and botany appear to go hand-in-hand here, as they ought to do everywhere else; the one being the helpmate of the other. There is here a collection of fruit trees, illustrating all the forms of pruning and training, for which French arboriculturists are famous. There are wire trellises 10 or 12 feet high, and single, double, treble, and palmate cordons trained to them. There are pyramids of the ordinary kind, and others of fantastic shapes. There are goblets of various forms, and all are admirably managed. At the entrance-gate we were informed by a large placard that M. Weber gives demonstrations in arboriculture, while Dr. Lagneuse does the same in botany. It appeared to me remarkable that while such things could be done in a departmental garden in France, there is not in all Great Britain a place where demonstrations in arboriculture can be obtained, notwithstanding the importance of the subject to British landowners. There is something still wanting in our educational system, and it is to be feared that in our solicitude for primary schools, our educational boards forget the middle class and the technical education of the people. I hope the day is not far distant when we shall have departmental technical schools among us, where the higher economies of botany and horticulture will be properly taught.

In the garden at Dijon there is a fine hedge of Thuja (Biota) orientalis, the Chinese Arbor-Vita, which is 20 feet high. I think from the upright habit of the tree and its dark green foliage it is the variety which I used to know long ago as tatarica, quite distinct in habit from the normal form of orientalis. But whichever it is, it makes an admirable fence,

a far superior one to the American Arbor-Vitæ, *T. occidentalis*, much more dense, and of a brighter and richer green.

Finding the country all round covered with snow, and the earth bound in a hard frost, I was glad to hasten on to Lyons, in hopes that a change for the better would be got. I found Lyons enveloped in a fog as dense, if not quite so yellow, as some of those we experience about London, and for four days this had been the case. It cleared away, however, and was followed by as hard a frost as that I left behind me at Dijon. The sun was bright, however, in the middle of the day, and the picturesque scenery of this fine city was lit up as if it was summer. I had no time to see any of the gardens here, nor would it have been much use if I had, for there is little now to be seen. I paid a visit to that enthusiastic amateur M. Jean Sisley, who received me cordially in his fine Franco-English manner. I found him busy sowing seed of Zonal Geraniums, from which he expects, no doubt, to raise varieties which will some day make themselves widely known.

In the flower market at Lyons there was not a great deal to be seen. The great thing of the season appeared to be small Spruce Firs, with the dyed flowers of *Xeranthemum annuum* tied to the tips of the branches.

There is one thing I remarked at Lyons, and which I found to prevail all the way southwards, and that is the mode in which horses are partially clipped. It is not a gardening subject, but it may have interest for many of the readers of these lines. In England I noticed before I left that the omnibus horses in London and working horses in the country are clipped all over their belly and legs, the long hair being left on the sides and back. Here the back and sides are clipped, and the belly and legs left with the natural covering; and this appears to me the more sensible way, for a cloth is put over the back, and the belly and legs are naturally protected by the hair, whereas in the case of English horses the legs and belly are exposed to the rigours of all weathers without any means of protecting them. It would not be very convenient to put long stockings on horses, and this appears to have suggested itself to the French, who preserve the natural covering.—*L. MENTONE.*

#### ESTIMATE OF GRAPES.

I HEARTILY agree with Mr. Luckhurst in what he says about Black Alicante Grape. With us here it promises to keep quite as long as Lady Downe's, growing by its side, and, as Mr. Luckhurst says, the bunches are much better. With regard to Mrs. Pince's Black Muscat, I am afraid that there is more than one variety of this fine late Grape. I have now met with what I take to be the true variety in three different places, and in every case the fine-proportioned bunches, thickly set with full-sized berries, and of good finish, were everything that could be desired. Now we have here two plants of Mrs. Pince; one (the true one) is planted in an intermediate house along with Hamburgs, Foster's White Seedling, &c., where, notwithstanding the disadvantage of its ripening so much later than those sorts, it has done pretty well, with the exception of two or three bunches at the bottom of the rafters, which seemed to have set rather imperfectly, but the colour was fair. I think it a great mistake to plant this Vine along with early sorts. It thrives well enough under cool treatment as far as the health of the Vine is concerned, but its fruit requires the same length of time and temperature as Muscats to ripen it fully. It cannot be denied that it will ripen under ordinary treatment with other sorts, but then while trying to ripen it mischief is very often done to those which are ripe before Mrs. Pince is much changed in colour. The other Vine referred to is planted in the late house along with White Tokay, Black Alicante, and Lady Downe's. The Vine is as vigorous, if not more so, than that in the intermediate house; the leaves, too, are quite in character with the other; the bunches are more broadly shouldered—in fact, they are quite as broad as they are long; the berries are much of the same substance, but irregular in size, the footstalks have not that stout robust appearance which is its character, and the colour is very poor. I also find the bunches are shanking, the footstalks of all the smaller berries are shrivelled-up, and the berries themselves are now (16th January) beginning to shrivel.

Has Mr. Luckhurst observed any difference between the Vines of Mrs. Pince which he has and those he has seen when from home? I hope my case may be a solitary one, but the various opinions about the quality of this Grape almost convince me that there may be something in there being two sorts;

and if so it would be well for those who have not succeeded with it to communicate with their friends who have, and see that they have the same sorts. Our two Vines were both planted at the same time and in the same border, so that difference of situation can have nothing to do with this case.

While on this subject I will say a few words about the mode of allowing Vines to grow to the extraordinary length of 25 feet in one season. I cannot see the utility of allowing a Vine to grow to such a length, and then at pruning time cutting-off 16 or 18 feet of the best of the canes. I say the best of the canes, for I have always found that the best wood and buds are to be found just below where the canes have been stopped, and where side shoots have pushed to a considerable length, providing the wood is thoroughly ripened. My method is to stop the canes a short distance above the place to which they are likely to be pruned-back, and encourage all the eyes on the young canes to break, train the resulting shoots in the usual way to occupy all the space, stopping only to prevent crowding. This I have practised for five years, and I find that fine fruiting eyes are produced at the base of the side shoots (just such as are so often cut away), and always well ripened. Some four years ago our Editors thought fit to publish a few remarks of mine on this subject with their own ideas, from which I profited, but I was sorry this failed to draw any discussion. In September, 1872, I, with a friend, paid a visit to Lambton Castle, about the time of the Glasgow Show, and saw those fine Grapes of Mr. Hunter's, and my heart leaped when I saw the side shoots trained along the wires like Pear trees on a wall, and at their base those very buds that would produce the 14-lbs. Hamburgs.—*R. INGLIS.*

#### MUSHROOM HOUSE AND MANAGEMENT.

I AM frequently asked by amateurs how to grow Mushrooms, and having had a large share of success for many years, perhaps a few notes descriptive of my method may be acceptable to some of your readers.

The house should have a north aspect, in which case you may grow Mushrooms nearly all the year round; and the roof, of whatever material it may be, should be ceiled, as its being so tends to keep the temperature more uniform. The heating medium should be hot-water pipes or a brick flue.

The beds, or shelves, ought to be arranged as conveniently as possible; I prefer them of wood, 1 foot deep and 3 feet wide. I usually commence forcing about the first week in September. Horse droppings are collected every morning from the stables and placed under cover, and when I have enough for a bed I make it up at once, mixing with the droppings one barrowful of loam to six of droppings. The bed should be made quite firm. As soon as the heat begins to rise I make holes with a dibber 8 inches apart over the whole bed. In three or four days the heat will begin to decline; when it is about 75° the bed is ready to spawn. It is then covered with 1 inch of loam and beaten quite smooth, and a moderate covering of hay placed upon it. In four or five weeks the greater portion of the hay may be removed, leaving just sufficient to cover the surface. I never water the bed, but if the hay feels dry a very slight dewing-over is given it. In six weeks the Mushrooms will begin to appear, and will continue producing for about three months. Successional beds should be made-up according to the requirements.—*THOS. PROSSER.*

#### CULTURE OF CHEILANTHES ELEGANS.

THIS is one of the most beautiful of Ferns and yet often in collections it is in a miserable condition—in fact, struggling for life in a temperature and atmosphere quite uncongenial to its health. To those, therefore, who have not succeeded in the culture of this Fern I offer a few remarks, which, if attended to, will insure success and gratification.

We will suppose you have a young plant in a 5-inch pot in the spring. First turn it out of the pot, and examine if it is full of roots; if so, it will require a shift into a clean pot two sizes larger, which will be a 7-inch pot. Drain this well, and put a little moss on the top of the drainage; then prepare a compost of three parts peat and one of light turfy loam, and add as much silver sand as will give the whole a sandy appearance. If you add to this a little charcoal or charcoal-dust, to keep the whole sweet, you will have a mixture that almost all Ferns will luxuriate in. Pot the plant firmly in this soil. If you have only a small greenhouse, you can grow it to perfection.

The great mistake made by many in managing this Fern is

placing it in a close moist atmosphere and using the syringe freely. Under this treatment it will not succeed. But give it a greenhouse temperature, a gentle circulation of air, and water when it requires it, but not wetting the fronds, and you will be gratified by seeing frond after frond rising and developing themselves into beauty.—J. ANDERSON, *Hill Grove, Kidderminster.*

## A CENTURY OF ORCHIDS FOR AMATEUR GROWERS.—No. 17.

### DENDROBIUM.

As I have before remarked, this is purely an eastern genus, the various members of which conform to block and basket culture perhaps better than most others, although I prefer pot culture for some of those which make stout heavy pseudobulbs. The species enumerated in the sixth article of my "Century" were all kinds adapted to cool treatment, and I was much gratified to receive a letter from a most enthusiastic lover of plants who resides in Surrey, not fifty miles from London Bridge, informing me that his plant of *Dendrobium speciosum* had this season produced him three spikes of flower for the first time, and that he believed it was brought about by following the open-air treatment recommended by me. This, then, is satisfactory to him, and it is also satisfactory to me, inasmuch as I have enlisted him in the ranks of cool Orchid-growers, and I am sure this is the surest way to dispel the erroneous notions which some will still entertain respecting the difficulty attending their culture. Depend upon it, readers, if you love a plant you can grow it, because you will leave nothing untried which is likely to conduce to its well-being; and let me add, if you do not love plants it is quite useless to expect to be successful with anything but weeds, and they will grow up without love or without care, for few people who are not enthusiastic lovers of plants can imagine how much beauty and how much pleasure can be stowed away in one little greenhouse, or even a frame. It can only be compared to the "Turkish delight" which my boys buy sometimes in lumps, and I have seen so many gems brought out of a little house scarcely large enough to turn round in, that one would almost imagine the lumps must be closely packed too. However, this is rambling from my subject, so I will just ask you to refer back to page 264, of March, 1873, and all requisite information respecting soil, &c., will be found.

**D. CAMBRIDGEANUM.**—This is sometimes grown under the name of *D. ochraceum*, which, however, is not at all applicable to the plant. It thrives admirably upon a block of wood, the pseudobulbs attaining a length of from 4 to 12 inches. The flowers are produced upon the young unripened growth, and are very attractive; the sepals and petals are bright orange-yellow in colour, and thick in texture; the lip is of the same colour, but is ornamented with a large heavy blotch of deep crimson about the centre. It usually flowers in the spring of the year. Native of the Khasia Mountains.

**D. DEVONIANUM.**—I am utterly at a loss to find words to depict the charming and elegant flowers which adorn the pseudobulbs of this species during the months of May and June. The growths are pendulous, from 1 to 3 feet in length, or even more, but very slender, and it should always be grown either in a basket or upon a block. The flowers are both numerous and large, measuring about 2 inches in diameter; sepals and petals waxy-white shaded with pink, the petals being tipped with deep rosy purple; lip large, broadly heart-shaped, and of the same colour as the sepals, but margined with rich rosy purple, and stained with two large bright orange spots, whilst the outer edge is beautifully set-off with a deep fringe or frill. It enjoys a very moist atmosphere when growing.

**D. LITULIFLORUM.**—This is another superb plant, which should be grown in a basket, as the terete pseudobulbs are pendulous, and from 1 to 3 and 4 feet in length, and these when laden with its splendid flowers have a truly gorgeous appearance. It requires an abundant supply of water in the growing season, but during winter only just sufficient to prevent the growth from shrivelling. The flowers are freely produced, and are large and handsome; sepals and petals rich soft purple; lip large, white margined with dark purple. Unfortunately this fine species remains rare, and is consequently rather higher in price than some of the other kinds. It usually blooms about April, and lasts two or three weeks in beauty. Native of Assam.

**D. TORTILE ROSEUM.**—An erect-habited plant, which should be grown in a pot. It is generally considered a difficult plant

to manage satisfactorily, because it is forgotten that although it is a native of the island of Java, high mountains are to be found there as well as on the mainland of India, and that the plant occurs at considerable elevations. The pseudobulbs grow from 1 to 2 feet in height, and somewhat resemble *D. nobile* in appearance. The flowers are freely produced during May and June; the sepals and petals are slightly twisted, and soft rose in colour, whilst the lip is primrose yellow tinged with rose. It is a great favourite with me, but latterly seems to have lost some favour with amateurs, probably from the cause already named.

**D. AGGREGATUM MAJES.**—A dwarf-growing plant, which should be grown upon a block of wood. The pseudobulbs are light green, and bear a small, dark green coriaceous leaf. Scape short, bearing a few medium-sized, soft yellow flowers. It is a very free-flowering and pretty species, which should find accommodation in every amateur's collection. Native of the cooler parts of India.

**D. CHRYSOTIS.**—A species of somewhat recent introduction, and extremely beautiful. The stem-like pseudobulbs are slender, and attain a height of from 2 to 3 feet, or even more. The leaves are bright green, and saving the fact of its blooming when the leaves are upon the stems, the habit resembles that of *D. fimbriatum*. The whole flower is of a rich apricot yellow; the edge of the lip is beautifully fringed, and it has also two blotches of deep blackish purple on the lip. It should be grown in a pot. Native of Assam.

**D. WARDIANUM.**—Tastes differ much, some preferring one particular style of beauty and some another; indeed, it is well Nature has so constituted us. To me this species of *Dendrobium* stands quite at the head of the list. It should be grown in a basket, for it makes long pendulous pseudobulbs, with thickened nodes some 3 feet in length when vigorous. The flowers are very large, measuring between 3 and 4 inches across; sepals and petals waxy-white, the apices being tipped with rich magenta; lip large (destitute of the beautiful fringe which is such a marked feature in *D. Devonianum*), deep orange, with two large crimson-purple blotches. Its season of flowering is during April and May, and the blooms last a considerable time in perfection owing to their great substance. Unfortunately it still continues somewhat rare, but from my partiality for it I have been constrained to include it in this enumeration. Native of Assam.—EXPERTO CREDE.

## THE ACACIA AND FREEMASONS.

SOME weeks ago an inquiry appeared in THE JOURNAL OF HORTICULTURE as to what species of Acacia was held in esteem by Freemasons. The question was transferred to *Notes and Queries*, and has elicited the following reply—

"In the old work in my possession which has been once or twice quoted from in *Notes and Queries*—viz., '*Les Plus Secrets Mysteres des Hautes Grades de la Maçonnerie Dévoilés*,' I find at page 9 of the preface the following passage—'*L'Acacia, si renommée dans la Maîtrise, est pour rappeler la mémoire de la Croix du Sauveur du Monde, parce qu'elle fut fait de ce bois, dont la Palestine est remplie. C'est la raison pourquoi le Bijou du Grand Maître est tel qu'il est ici tracé*, fig. 4.'

"The Acacia alluded to will, I suppose, be the common Locust tree about which Cobbett used to write. It is abundant in Palestine. The fig. 4 alluded to in the extract above is a mere representation of the 'bijou.' In its centre is a Calvary cross, but the Acacia is not apparent, as might be supposed from the reference. The artist intends us probably to imagine that the cross is one made of the Acacia tree. In Germany the avenues to the Catholic churches are generally formed of Locust trees, and I have heard it stated as a reason that the cross was made of an Acacia. The German avenues are always of the common Locust tree.—JAMES HENRY DIXON."

As a matter of fact, the so-called Acacia of gardens is not a member of that genus, but a Robinia (*R. pseud-Acacia*); moreover, it is not a native of Palestine, but of North America.—J. B. Q.

**WINTER-BLOOMING RHODODENDRON.**—It may be interesting to the lovers of that best of all evergreen shrubs, the Rhododendron, to hear of a specimen now in bloom in my garden, of *R. lancifolium*. It is about 16 feet high, 50 feet in diameter of branches, and has now expanded, or nearly so, upwards of four hundred splendid scarlet trusses of flower. The brilliancy of its colour, the admirable shape of its blossoms, and the way in which the foliage falls down about the truss so as to set it off to the best advantage, render this the most beautiful

Rhododendron I ever saw in this kingdom. I live in a remote region of the north of Ireland.—JOHN R. BOYD, *Ballymacool, Co. Donegal*.

### GROS GUILLAUME A KEEPING GRAPE.

My vinery is very small, and I have few kinds of Grapes, and am, therefore, not qualified to speak from extensive experience of the keeping qualities of various kinds. Nevertheless, I cannot withhold my testimony to the superiority of Gros Guillaume (Black Barbarossa), amongst all that have come under my notice. I have just tasted a cluster cut in the beginning of October attached to a small piece of the wood and hung-up in a dry garret, but without the advantage of being in a bottle, and find the flavour most excellent. The berries are a little shrunk, but not much, and the abundance of saccharine juice has made them very like fine raisins, but with a peculiar high aroma. I hope this Grape, which was for a long time under a cloud, will now be better understood and appreciated. In my opinion it should not be sent to the table early, but either kept on the Vine, or, if cut, allowed to hang in a dry room for some time till the flavour is fully developed. I must confess, however, that with me this Grape is not very prolific.—JOHN FERME.

### NOTES ON THE SEASON AND ITS EFFECTS.

MILD as the autumn has been, and for so long a period too, it is many years since the common Primrose was in so backward a state as it is now, and the same remark applies to the Laurustinus; both in 1871 and 1872 this shrub was in full bloom early in December, the fully-expanded flowers being in such numbers as to give the whole plant a white appearance. Our sharpest frost for the year was on December 29th, but it speedily gave way to milder weather, and at the time I write (January 13th) there have been no signs of winter yet; still there is very little advance in the buds of deciduous trees, only such plants as Clematises and Honeysuckles that bud early having made any progress, and it is well they are so backward; but, as we expect a prolonged period of mild weather to hasten on such things, I am a little puzzled that Roses have not commenced growing. Winter-blooming plants, as Hellebore, the Snowdrop, Laurustinus, Garrya elliptica, and Primroses, are later rather than earlier. Few of the single white Primroses are yet in full bloom, though they are often so early in November. The same may be said of the wild Primroses, and Snowdrops are no further advanced than when they were covered for some weeks with snow. It would almost appear as if Nature were keeping everything back this season, the better to escape the rigour of a late winter.

In the case of the Laurustinus I cannot but connect its lateness with the season that is past, and in so doing I will glance at the meteorology of last year. The winter, on the whole, was mild, and the spring, up to the end of April, gave promise of being early; but May was a dull cold month, and the same may be said of June up to the last week, which was fine. June was also wet, and the two previous months having been dry, the rain that fell then assisted all the coarser kinds of vegetation, and grass and hay were abundant, as well as many kinds of vegetables, but summer could not fairly be said to have set-in till the middle of July. After that there was but little fault to be found with the season, as August was a fine month, and all the rain that fell in September and October was needed. November and December were very mild, the latter month also so dry that no measurable quantity of rain fell the first fourteen days, and the roads were dusty. Now, in the case of a shrub like the Laurustinus, the growth of which takes place early in the season, I imagine that the cold weather we experienced in May and June tells at the present time in their backward condition as to blooming, and possibly the same may be the case with the Primrose and other plants. Their growth being protracted, it is probable that their resting period must be so too, hence the lateness of their blooming. I hardly know on what other principle to account for their backward state.

Assuming the cause assigned to be correct, I have no reason to doubt but that a good bloom will be in time produced; most plants look well, and, being late, are not likely to be injured by the inclement weather. Still I am not sure that a mild winter is to be desired, excepting on some accounts, for the ground rarely works well afterwards, and a late spring often follows.

Although the season has been mild and the autumn dry, there have been drier years—viz., in 1855, 1858, 1862, 1863, and 1870; and even as regards frost, I find the minimum thermometer fell lower last year than it ever did in 1863 or 1872. There were several summers in which hotter days occurred. The sharp frosts in spring did much harm to the fruit crop, and a bad planting-out time to the flower garden; but the prolonged summer made amends for the latter, and if fruit was less plentiful than could be wished, in most cases it was good, and Apples certainly keep well. Complaints have been made of Pears not doing so, but there have been seasons when they have been worse. The great drawback seems to be the bad condition of the Potatoes. On the other hand, all the Cabbage and Broccoli tribe seem to have benefited by the mild autumn, and for them a gradual approach to winter would be better than a sudden one, as they are very succulent and tender.

Subjoined is the rainfall of the past year compared with previous ones, also the number of rainy and frosty days.

—J. ROBSON, *Linton Park*.

### GREEN'S PATENT GUINEA LAWN-MOWER.

WE are informed that it is composed of the smallest number of parts of any other lawn-mower. The framework is cast

all in one piece, and therefore is not liable to be twisted or by any means to get out of order. The cutters are fitted in the cylinder without wedging or wiring, and yet they are so firmly fixed that they cannot be shaken or in any way become loose. The fixings or caps of the cylinder are fitted together by two bolts and two screws only, and the cylinder itself can be adjusted or removed by the most inexperienced person in two or three minutes. The motive power is given by the travelling wheels, into which a pinion fixed on the end of the cylinder-shaft is geared, giving revolving motion to the cutters. It will cut either short, long, wet, or dry grass, bents, &c. The grass-box is fixed behind the cutters, so that the machine will cut grass close up to trees, seats, walls, and underneath shrubs without the box having to be removed. It is eminently adapted for banks, slopes, flats, &c. The handle

of the machine will suit the height of the person using it at any angle.

## ROYAL HORTICULTURAL SOCIETY.

JANUARY 21st.

Among the alterations in the new schedule of the Society's Shows is the abandonment of a number of the minor exhibitions held in conjunction with the Committee meetings, the subjects brought forward at the latter often forming a show of themselves. Unfortunately on this occasion, from whatever cause, there was scarcely anything exhibited; let us hope that the future meetings will present a greater degree of interest after the Annual General Meeting, when it may be anticipated that the state of ferment in which the Society at present is shall have subsided.

**FRUIT COMMITTEE.**—A. Smece, Esq., F.R.S., in the chair. There were very few subjects brought before the Committee. Mr. E. Bennett, gardener to the Marquis of Salisbury, Hatfield, Herts, sent specimens of fruit of *Psidium Cattleianum* (Cattley's Guava); the plants had been grown in the open air during summer and autumn, and the fruit ripened in a coolinery. The flavour was very indifferent. He also sent a dish of Early Profligate Tomato, which had been grown in a coolinery; the fruit was well kept. With these came a dish of pods of *Tacsonia Van-Volxemi*, which are edible, but the flavour is not agreeable. G. F. Wilson, Esq., of Heatherbank, Weybridge, sent specimens of Newtown Pippin Apple from a pot tree; the fruit was well coloured, handsome in shape, and of excellent flavour. Messrs. Masters & Kinmont, nurserymen, Canterbury, sent seedling Apple Duchess of Edinburgh. Two dishes of Potatoes were sent by Mr. R. Dean, seedsman, Ealing—viz., Extra Early Vermont and Brownell's Vermont Beauty, two excellent American sorts certificated at Chiswick last year.

**FLORAL COMMITTEE.**—R. B. Postans, Esq., in the chair. Messrs. Standish & Co., Ascot, sent two dozen potsfuls of Lily of the Valley, excellently bloomed, and for this early season quite notable. From G. F. Wilson, Esq., Heatherbank, Weybridge Heath, came a very large-flowered *Cineraria*, which had no other recommendation beyond its colour. Mr. Denning, gardener to Lord Lonsborough, Norbiton, sent *Odontoglossum angustatum*, by no means remarkable; the flowers small, pale creamy yellow, spotted with brown, the lip purplish at the base. Mr. W. Paul, of Waltham Cross, exhibited two stands of Camellias, in which *Lavinia Maggi*, *Ulaute*, *Elegans*, *Doukelaari*, *Conspicua*, *Fimbriata*, and *Alba plena* were conspicuous. From Messrs. Dolson & Sons, Isleworth, came an excellent group of *Primula sinensis fimbriata* of the red and white-flowered varieties. Mr. R. Dean, Ealing and Bedford, sent white bedding *Viola White Swan*, grown in a cold frame. This is a seedling from *Viola lutea grandiflora*, and is stated to be the earliest flowering of all the bedding *Violas*. A pretty little pan of *Primroses* was also shown by the same exhibitor, and in this *Violet Gem* and *Rosy Morn* were especially pleasing. The only first-class certificate awarded was to Messrs. Veitch for *Cypripedium Roezlii* with a yellow alipper, with the sepals and petals veined with purple, giving the flower a lively appearance, which will render it a favourite.

## CONTINUANCE OF EUCHARIS AMAZONICA IN BLOOM.

In your No. 630 of April 24th, 1873, you published an account of the treatment followed here for many years in the cultivation of *Eucharis amazonica*, and the result as indicated by the period of blooming, showing a total of 314 days out of 366 in the previous year. The following is the result of the year just passed:—

Days in flower, January 31	Days in flower, July 17
" February 28	" August 27
" March 21	" September 30
" April 30	" October 31
" May 31	" November 30
" June 21	" December 31

Total—328 days in flower out of 365.

—JOHN SAYERS, Gardener to Thomas Lowry, Esq., Rockville, Blackrock, Co. Dublin.

**MR. MICHOLLS' COLLECTION OF PLANTS.**—We regret to learn that the collection of magnificent specimen stove and greenhouse plants belonging to H. Micholls, Esq., of Southgate—which have caused such a sensation wherever exhibited by his highly-skilled gardener, Mr. Thomas Baines, which have been in fact the heroes of a hundred fights—is to be dispersed this

spring, in consequence of the proprietor being about to remove to a west-end mansion.

## CINERARIA CULTURE.

I USUALLY make the first sowing at the beginning of March, and as soon as the seedlings appear they are placed very close to the glass in a cool house. The principal object to be borne in mind is good robust plants. The compost should be fibry loam, silver sand, and old decayed cow dung. Place the cow dung in a shovel over a fire long enough to kill worms, and then powder it up. Never place the seedlings on the north side of a hedge, but plunge the pots in ashes up to the rim in a pit facing the north. They can be successfully grown in a pit facing south, in the full heat of the summer sun, by every morning drawing-on the lights, and whitewashing them for shade, and in the evening drawing them off. *Cinerarias* love the dew during their growth. I use blood diluted with water. No liquid manure that I have ever used has afforded such good results. The plants are liable to be mildewed. To stop it place good-sized lumps of lime, newly burnt, here and there about the pit.

The *Cineraria* is one of the best winter-blooming plants when well-grown robust plants are produced.—F. P. LUCKHURST.

## PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

**STEUDNERA COLOCASIEFOLIA.** *Nat. ord.*, Aroidæ. *Linn.*, Monœcia Polyandria.—Native of South America. Spathe yellow, throat purplish. "Mr. Bull believes that he received his specimen from Calcutta, but it is certainly not an Indian form. It belongs to Schott's section or tribe of *Asterostigmeæ*, and its allies are for the most part American; it, however, closely resembles in the form and colouring of the foliage a very ornamental Aroid (*Colocasia Jenningsii*), which I found in the Khasia mountains. The specimen here figured flowered in Mr. Bull's nursery in May, 1873."—(*Ibid.*, t. 6076.)

**MESEMBRYANTHEMUM TRUNCATELLUM.** *Nat. ord.*, Ficoideæ. *Linn.*, Icosandria Di-pentagynia.—Native of South Africa. Flowers yellow. "M. truncatellum was introduced into Kew in 1795 by F. Masson, one of the travellers attached to the establishment, and is described as flowering in November; our plant was sent by Principal MacOwan, of Gill College, Somerset East, and flowered in October, 1873; it is a very rare species, was unknown to the Prince Salm Dyck, and is hence not included in his magnificent work; it has never before been figured."—(*Ibid.*, t. 6077.)

**BAMBUSA STRIATA.** *Nat. ord.*, Gramineæ. *Linn.*, Hexandria Monogynia.—Native of China. The anthers are purple and showy. "The specimen at Kew, sent from the Calcutta Botanic Gardens, is about 6 feet high, but Lindley describes it as attaining 20 feet, which from its habit it may very well be supposed to do. It belongs to Munro's third section of the genus *Bambusa*, which has a long hairy style, and to which the *B. vulgaris* and two other species belong. This plant flowered in November last, with Mr. Bull, who kindly sent me the specimen figured; its anthers stain paper of a lilac colour; it has been called *B. Fortunei*, which I take to be a very different plant."—(*Ibid.*, t. 6079.)

**GOOSEBERRIES LORD DERBY AND VICTORY.**—"The Gooseberries of the Lancashire growers have long been famed for their great size, but an impression is abroad that they are inferior in quality as dessert fruit. This, however, is a false conclusion, so far as many of the varieties are concerned. We have selected, from a number of sorts obligingly forwarded to us last season by Mr. C. Leicester, of Compton Road, Macclesfield, two varieties, which were certainly quite up to the average as regards the important quality of flavour, while from their size and beauty they rank amongst the choicer sorts grown for exhibition. *Lord Derby* is a seedling of Mr. Leicester's, and is as yet new and little known. It is a fine showy fruit of the hairy-red class, bright and telling in colour, and brisk as well as rich in flavour; in every way a first-class fruit. *Victory* is less novel, but is a first-rate variety amongst the whites. The former has been grown as heavy as 22 dwts. 11 grs.; the latter has reached to 17 dwts. 10 grs."—(*Florist and Pomologist*, 3 s., vii., 1.)

THE ROYAL HORTICULTURAL SOCIETY AS IT IS AND AS IT MIGHT BE.—This is the title of a pamphlet by G. F. Wilson,

Esq., F.R.S., now published. We have seen this, and we have a circular also announcing the formation of a "Vote-by-proxy Association." At present we withhold all commentary.

### OLD FRIENDS WITH NEW NAMES.

THE *Irish Farmer's Gazette* is right about synonyms and pseudonyms, but is not right in saying that Rivers' Royal Ashleaf is the same as Myatt's Prolific. Lord Portman's gardener, Mr. Leach, told me that at Bryanston they preferred Myatt's Prolific to the Royal Ashleaf. The raiser of Mona's Pride sent it to me from the Isle of Man, and I say that it is not the same as the old Ashleaf. Mona's Pride is a much larger Potato and has much stronger haulm; it is a great cropper, and does not require such high cultivation as the old Ashleaf. It is inferior to it in flavour; moreover, its haulm and foliage are more frost-resisting. The Lapstone, Pebble White, and Yorkshire Hero, though much alike, are not the same. They are all three here. The last two are evidently derived from the Lapstone. Haigh's Seedling properly is the Copper-nosed Kidney, from which the Lapstone was derived. Both having been raised by Haigh, may therefore be called Haigh's Seedling. Major Haigh, who was an army boot and shoe contractor, died at Bardsley, near Leeds, about 1855 or 1856. I consider the old Ashleaf and the Lapstone for quality and flavour to be still the best two Potatoes. The old Ashleaf requires protection for its haulm and foliage in spring. I do not keep it now, but I used to grow it successfully by protecting the haulm with wooden troughs like the roof of a house, raising the ends on bricks as the plants grew. Keep the foliage dry, and Potato plants will bear many degrees of frost.—W. F. RADCLIFFE.

### RECENT GLEANINGS ABOUT INSECTS.

In reply to a correspondent, Mr. Newman remarks, in the "Entomologist," that the common and annoying little moth *Hypomontia padella*, the larva-webs of which overspread Hawthorn hedges and fruit trees, has not yet had its history clearly made out. Haworth, who called it "Padi," described five varieties, while Stainton, our latest authority on the small Lepidoptera, sees no notable differences between those that feed on the Apple and the Hawthorn, and we do not know positively what is the continental type. Guenee has a "Mallinellus," which Mr. Newman thinks may be our Apple-feeder.

One of the assistants of Messrs. Mauder, of Wolverhampton, discovered in a nodule of Sierra Leone copal a living larva, seemingly of a beetle, the cavity being considerably larger than the body of the insect, yet hermetically sealed from the outward air. Two curious questions suggest themselves: "How did it get in?" and "How long had it lived in such a position?" The Rev. G. C. B. Madden records a singular change of instinct on the part of bees. In the district of San Francisco there were formerly no hive bees. Some swarms were introduced there, and in their customary manner they stored-up honey for the winter; winter, however, did not, as a matter of course, come as they anticipated, and it was found that thenceforth they ceased to lay-up stores, and only employed themselves in their usual labours for the continuance of the race, and obtained food as they required it.

Some further observations on the subject of controlling sex in butterflies have been published in the "American Naturalist," and Mr. Riley adduces evidence tending to upset Mrs. M. Treat's inferences based on her own experiments, though he compliments the lady entomologist on her diligence, and adds that "most naturalists will be proud that a lady has set the example of making such investigations." As to this conclusion we are not so certain. It does not appear that any facts noted by Mrs. Treat go to upset what is still regarded as a fundamental principle by anatomists and physiologists—viz., that the sex is determined at the moment of conception. In that case each egg of a butterfly or moth leaves the body of the parent insect with the germ within it of the future male or female, and in the overwhelming majority of insects these are in equal proportions throughout each brood, though it may happen that the progeny of a particular insect here and there may show an overwhelming preponderance of one sex over the other. From the experiments made by stinting larvæ in quantity of food resulting in the production of more males, Mr. Riley only concludes that the females being the larger mostly, and therefore needing more nourishment, are diminished necessarily by this treatment in larger proportion.

That distinguished entomologist Mr. H. Doubleday has lately expressed his opinion in severe terms, though not stronger than the occasion requires, on the mischievous and dishonourable practice of foisting foreign specimens into so-called collections of British insects, which is now rendering it almost impossible to verify the authenticity of most specimens of rare Lepidoptera.

Concerning aphid honey Mr. F. Walker writes in the "Entomologist":—"Bees find their honey comparatively prepared for them in flowers, but the honey by the medium of aphides has various beginnings. It is extracted from the crevices of old Oak trees, from the twigs of young Oak trees, from the roots of Grass, of Sow Thistles, and of Parsnips, from the Nettle and the Bramble, from the Ivy and the Honeysuckle, from the Willow and the Poplar, from the Bog Myrtle and the Sea Aster, and its sweetness has abundance of other sources." What a pity it is in these scarce times that we cannot utilise aphid honey as an article of food!

A specimen of the exceedingly rare Sphinx, known to collectors as the Orange-tailed Clearwing (*Sesia allantiformis*), has been taken by Mr. Bryant at Greenhithe, the locality where the first authentic British example was captured by the late Mr. Chant many years ago. As late as the 7th of October an individual of the Silver-striped Hawk-moth (*Chærocampa celerio*) was taken on the wing at Bolton.

### BELGIAN HORTICULTURE.—No. 6.

M. LOUIS VAN HOUTTE'S NURSERY.

AFTER giving a general idea of this establishment, it is possible to summon a few particulars that may be of interest. Not a few have seen this world-renowned place, but the majority of your readers have had to content themselves with the descriptions of others, necessarily vague and disjointed, for it is difficult to know where to start, and once started, even more so to know when to stop. However, by way of finding a starting point it may be said, as there is no attempt at outside show, there are no grand specimens artistically grouped to create a striking impression inside. The establishment lacks the towering Palms of Linden's and the noble tree Ferns of Verschaffelt's; not that there are not fine and valuable plants of these and other subjects new and rare, but they are scattered over a great extent of houses, as if the health and comfort of the particular plants were more thought of than mere effect. It is evidently not the forte of this nursery to "go in" for covering a large area with a limited number of sensational occupants, the object being rather to raise by hundreds of thousands everything in demand, and so as to be easy of transmission to nearly all parts of the world. It is pre-eminently a plant-manufactory—by no other expression can it be understood so well.

Here, for instance, are Camellias manufactured to a greater extent, perhaps, than in any other nursery on the earth's surface. These alone are a sight to see: On one side a batch of 150,000 cuttings, striking apparently with the greatest freedom and absence of loss; on the other, 100,000 recently "worked," all in glass cases or frames in a temperate structure. In sunken brick-pits are stocks potted-off and plunged, rooting through and over the sides of the pots to perfection. Again, there are thousands of plants shifted-on after grafting, and standing out of doors in shady places, but free from "drip." One batch of 80,000 in bud, for sending-off the same autumn, were remarkable for their promise and luxuriance. They were standing between tall upright Poplars, which had been planted in lines from east to west, and at distances so that the shadow of one row reached the base of the other—the very place for a Camellia forest. Most gardeners are aware of the free growth and exuberant aspect of Belgian Camellias, and are also aware of their frequent retrogression shortly after being subjected to the change the plants meet with in England. Their luxuriance is called plethoria, induced, as is commonly supposed, by being planted out in the open ground, grown quickly, lifted, and potted. This is not so. I was told that I should see Camellias turned out in the open (prepared) ground and growing like Laurels. In this one nursery were, at the least, 500,000 Camellias in pots—plunged, it is true, many of them were, but yet each was potted; nor in any other place did I find any really planted out, save a hundred or two under glass in one nursery, and these were below par as to health. In saying this I do not assert that they are not plethoric as we understand the term, only that it is not induced by planting-out. It is but reasonable to suppose,

when a plant is forced into an extra luxuriant and abnormal growth in its early stages, that it is at the sacrifice of its permanent welfare. We prefer a more steady, sturdy growth at the beginning—a sound foundation, and in this I think we are wise; I have certainly seen finer, better, and more really sound and healthy large specimens of both Camellias and Azaleas in England than came under my notice “over the water.” Still, the young stuff of our continental neighbours grows with marvellous freedom, and their larger plants are wonderfully healthy, so that what we regard as plethora here is not so to the same extent there.

There is no doubt that the Belgians treat the Camellia generously. We may think they err on the side of liberal diet, but they think we err on the other side—starvation. Possibly the true line is the old one, a medium between the two extremes. There is very little doubt but that thousands of Camellias have been starved out of existence by being confined in a bare larder—a poverty-stricken soil—and having insufficient supplies of water. The Belgians water copiously, and occasionally (about once a week the grower told me), give weak cow-dung water, but their main dependence is on a full and free—almost lavish—supply of the pure element. With good drainage it is surprising the amount of water the Camellia will not only endure but delight in. The fleshy rootlets can brook no drought—not much more than can those of the Hyacinth; and if these rootlets are once permitted to shrivel, the emission of fresh ones is slow and stubborn work and, in the meantime, the plant loses health not easy to regain. Than a healthy Camellia nothing is much easier to keep healthy; than a sickly one few things are less easy to cure. But the Belgians have a leaf soil which we have not, or at any rate which is not common amongst us. In this the Camellia roots with extraordinary freedom, and it is thus endued, especially in its young state, with a remarkable hue of health. The leaf soil, it is evident, contains food in plenty, and easily digestible to the young plant; its lasting nutrition is another matter, and the point is open to conjecture. The plants, however, are mostly young when distributed, and the amateur purchaser is too often mortified to watch them change from ivy green to the unwelcome tint of waning health. Plants such as those referred to are coming over to England in large numbers, and will be killed by hundreds, but their owners part with them hardily.

I have letters on this point pressing for information. This must be my reply to them: These foreign Camellias will not stand a dry greenhouse shelf at once, and the soil not watered until the pot rings to the knuckles. Stand them on the floor for a time, and keep it moist. Water freely and syringe frequently for a week or two, adapting them to their changed circumstances by easy gradations. Let them remain in the same soil until they have made their fresh growth. There would seem to be, in the minds of many, an irresistible propensity to pick away the soil from a plant the moment it comes from any nursery. There is a vague notion that it is not right and they must “give it fresh.” This, in nine cases out of ten, is a mistake. One check at a time is enough. Do not, therefore, be in haste to add to a change of temperature and atmosphere a change of soil, and run the risk of giving worse than you take away into the bargain. The older a man grows, and the more experience he has, the more will he be disposed to repose confidence in a trusty man, and such are all our nurserymen of reputation. Trust their soil, then, and give it at least a few weeks' grace, and it will be better for seller's fame, buyer's temper, and the plant's health. I must, however, defer a notice of fifty thousand Gloxinias in bloom and an acre of Azaleas for another paper.—J. WRIGHT.

### KEEPING FRUITS.

To grow good fruit requires a thorough knowledge of the subject, both as regards the pruning, pinching, and training of the branches, and the management of the roots. If the latter are in unsuitable soil, or that which has not been properly cultivated, or if the soil has been overdosed with rich manures, success is very uncertain. But the subject of this paper is not to show how to grow good fruit, but to give a few hints to amateurs and others as to the best way to preserve it in good condition.

It ought to be the aim of all cultivators of fruit to continue the supply of it for as long a period as possible. Gooseberries, Strawberries, Cherries, Raspberries, and all similar small fruits can have their season prolonged by planting in different situations; or if this is not possible, a selection should be made of

sorts that ripen at different periods. For instance: If early, midseason, and late Gooseberries are planted in a position fully exposed to the sun there will be a succession of fruit; the early varieties will be gathered before the late sorts come in; but if in addition to this a few bushes of some late variety that hangs well, such as the Warrington, can be planted under a north wall, a further advantage will be gained. Red and White Currants may be grown as bushes in the kitchen garden, and Morello Cherries as pyramids; but the same fruits do remarkably well, and the fruit hangs much longer on the trees, if they are planted against a wall facing the north. In warm seasons some of the choicer fruits will ripen well on a north wall, in some instances exceedingly fine Apricots have been gathered from such a position. Of course it would not do to plant there for a certain crop of this fruit.

Besides planting in early and late positions, it is often necessary to have recourse to nets to protect the fruit from the depredations of birds and wasps. Haythorn's hexagon nets are the best I am acquainted with for protecting fruit from wasps; but nets with close meshes are a necessary evil, and should not be kept on the trees longer than they are required to protect the fruit, as they prevent sun and air from gaining access to the trees at a time when these agents are most required to ripen the wood and the fruit buds for next season. If there is no danger of wasps attacking the fruit, old herring nets are the cheapest and best protection from birds. The nets should be raised above the bushes or trees by means of sticks with a fork at one end, and made secure at the surface of the ground by means of pegs. Even with all these precautions blackbirds and thrushes, allured by the tempting dainties, will make desperate efforts to get inside; they will run and fly all round the nets, looking for an aperture large enough to admit them. If any of the old nets which have been in use require mending it ought to be seen to now, and if new ones are required they should be ordered. All such repairs are best done at a time when work is slack.

*Keeping Apples and Pears in the Fruit-room.*—These fruits cannot be kept in good condition for a lengthened period if

Fig. 1.—Interior View.

there is no rightly-constructed room in which to store them; but besides this, the manner and time of picking the fruit are of primary importance. Apples should not be gathered before they are ripe, which can be ascertained by cutting one of the fruits, and if the seeds are of a light-brown colour the fruit may be gathered; if at the same time it does not part readily from the tree only a portion should be gathered, the remaining portion being left a week or ten days longer. Pears require much more judgment as to the best time to gather them. They should be taken at different degrees of ripeness; three gatherings may be made from one tree at intervals of a week or more, as the case may be, and there are some varieties which if allowed to remain on the trees until nearly ripe are worthless, such as Williams's Bon Chrétien, Beurré d'Amanlis, and Fondante d'Automne. Even Pears that ripen in midwinter are best gathered successively. Then all fruits intended to keep must be gathered carefully. A basket should be used to the handle of which a hook is attached to hang it on the tree, so that the person gathering the fruit may use both hands,

depositing it carefully in the basket. The fruit should not be removed from this until it is taken to the fruit-room and deposited on the shelves by hand. All fruit in any way damaged

should be separated from the sound specimens, this to be kept by itself and used first.

But for the fruit to keep well after it is gathered there

Fig. 2.—Ground Plan.

should be a good fruit-room. If possible a room should be built specially for fruit. An upper room is too dry, and a cellar is generally too damp. The floor of the room should be elevated a foot or more above the surrounding surface to insure a dry bottom, and the best form is a lean-to, with the highest wall on the south side, so that the sun would not act upon it,

as fruit requires an equable temperature. The walls should be thick, and if they are made hollow so much the better. Many fruit-room walls are of 9-inch brickwork, but 14-inch work is better; the thicker the walls are the more equable will be the temperature of the interior.

The internal arrangement should consist of a series of shelves

Fig. 3.—Longitudinal Section.

#### REFERENCES TO ENGRAVINGS.

*a*, Shelves made with battens,  $1\frac{1}{2}$  inch wide, and  $1\frac{1}{4}$  inch apart.

*b*, Close boarding around the sides of the room.

*c*, Air space between the boards and the wall. The roof also has an air space on the north side between the two plaster ceilings, as shown on the section.

*d*, Stove.

*e*, Circular window hung on pivots, and fitted with a roller-blind.

*f*, Partition between the shelves.

*g*, Each shelf.

*h*, Work similar to that in the fruit-room.

or stages one above another, with an outer edging to each to prevent the fruit from falling-off. The staging in the fruit-room at Loxford Hall is 3 feet wide, one stage being placed above another; the distance between is 1 foot 9 inches. The staging is of white pine, and is formed of laths made of inch deals; the laths are 1½-inch wide, a space of 1 inch being allowed between each. The stages are easily fixed. Upright posts of deal, 2½ inches square, reaching from floor to ceiling, are ranged in line; 3 feet from the wall cross-bearers, 1½ inch square, with one end in the wall and the other fixed to the upright posts, are placed at the proper distances, the laths being nailed to these cross-bearers. If the house is wide enough a table may be fixed in the centre, on the same principle as the side stages. The fruit keeps best if laid-out on these stages not more than two deep, all the better if only one deep.

Fruit intended to be kept in good condition after February should be packed in barrels or boxes amongst dry sand, each specimen being wrapped-up separately in soft paper. I have also kept fruit with straw laid under and over it, also laid out on cloths, but the above is what I consider the best. Of course, although it is recommended to build the fruit-room on the shady side of the wall, it does not follow that no other position will answer; facing east would be next best, then west, and south worst of all. A fireplace should be built in the room, though it will not be necessary to use it often. It will require to be lighted should very severe frost set in, as should the fruit become frozen it will soon decay.

Where the garden is but small, and only a small quantity of fruit to be kept, it may be stored in the dwelling-house in any convenient and suitable place, the main essential being that all fruit should be laid in an airy place for two or three weeks after it is gathered, all decaying fruit being removed as soon as it is perceived. Amateurs and others who have been successful in keeping fruit well under adverse circumstances would confer a great favour on many readers if they would publish through the columns of this Journal the means used.—J. DOUGLAS.

[The accompanying are drawings of a fruit-room, in which the later varieties of Pears in particular were kept in extraordinary condition till an advanced period of the season. Fig. 1 is a view of the interior, fig. 2 the ground plan, fig. 3 the longitudinal section. The reference letters are in all cases the same.]

## NOTES ON VILLA AND SUBURBAN GARDENING.

**INSECTS AND DISEASES OF PLANTS.**—Plants in rooms, especially Geraniums and Roses, are very liable to be attacked by aphides. These may be removed by tobacco smoke or tobacco water, and, where the smell is not offensive, smoke blown from a common tobacco-pipe is as effectual as any other method. Camphorated water may be used by those who dislike the smell of tobacco. Mildew occasionally, though rarely, attacks house plants, and its appearance shows that the plant has been in impure air, or otherwise improperly treated. Sulphur or camphor will effectually remove the mildew; and a scaly insect of the coccus tribe, which appears occasionally on Oranges, Camellias, and similar plants, may be removed by a sponge and water.

**PLANTS AND FLOWERS IN ROOMS.**—Many persons have a dislike to plants in houses as being unhealthy, and as their dislike is in a great measure groundless, I may notice it. Dr. Priestley was the first to show that the leaves of plants absorb carbonic acid gas by their upper surfaces, and give out oxygen by their under ones, thereby tending to purify the air in as far as animal life is concerned, because carbonic acid gas is pernicious to animals, and oxygen is what that life requires. It is in the light, however, that these operations are carried on, for in the dark plants give out carbonic acid, and this may be one reason why plants grown in the dark have little or no charcoal in their substance. It does not appear, however, that any of the scentless products given out by plants are injurious to human beings, because those who live among accumulated plants are not less healthy than others, though many persons feel dislike, and even pain, from the odours of particular plants in a way not very easily accounted for.

On the Continent in general, and in France and Germany in particular, flowers of all sorts, but particularly the most fragrant, are admitted into the saloons, chambers, and even bedrooms of people of all classes, and they, rather than complain of any ill effects arising from their presence, complain more of the difficulty of procuring them in sufficient abundance. The flowers most in demand for the chambers of the French and Germans are Oranges, Jasmine, Carnations, Honeysuckle, Mignonette, Olive, Rocket, Rose, Violet, Wallflower, Rosemary, Stock, Lavender, Savory, Oleander, Hyacinth, Lilac, Syringa, Heliotrope, Narcissus, &c.—all sweet-smelling flowers, and these

they indulge in to a very considerable extent. We may safely conclude, then, that plants admitted into rooms to the extent they are in general can produce no effect injurious to the health of the majority of people, but, on the contrary, will afford amusement to the mind and exercise to the body. The mind will be agreeably exercised in contemplating the beauty of the flowers, but much more so still if the study of their respective parts, nature, and structure, in a botanical and physiological point of view, be at the same time attended to. An agreeable and rational exercise will be provided for the body if the proprietor, particularly if of the softer sex, take the entire management of the little window garden.

Plants in rooms turn not only their leaves but their branches to the window by which the light entered, and a plant may, by turning it at intervals, be made to bend successively to all sides; but such bendings weaken the plant, and thus it is an excessive or unnatural action. This turning of the plant to the light is always, of course, in proportion to the brightness of that light as compared with the other sides of the plant. Flowers, too, open their petals to the light and close them in the dark, or in some cases, as in that of the Crocus, when a cloud passes over the sun. The same flower, and also some others, will open their petals to the light of a lamp or candle, and close them again when that is withdrawn.

It follows, as a necessary consequence, that in rooms plants should be placed as near the window as possible, that the window should have a south aspect, and that they should be as seldom as possible shaded with blinds or otherwise. If placed at a distance from the windows, plants should be frequently changed, and to place them on tables or mantel-shelves is bad management. As the weather has been very changeable lately, particular attention is required for protecting everything that is likely to be injured by frost. When the nights are sharp and cold all the plants should be drawn back from the window, or set down on the floor of the room. Pelargoniums, owing to the late mild weather, will now be nice plants if they have been well treated, and must be carefully watered. If they incline to grow-up weak and spindly the points of the shoots may be nipped-off; they should be watered sparingly, and allowed to have plenty of air every fine day.

**VEGETABLES.**—If not done last week, a sowing of Radishes may be made on a warm border if the weather is favourable, but the beds must be carefully covered in severe weather, as directed last week. Vacant ground, if any, may be dug, and everything that will forward the spring work should now be done before that busy time arrives.

**FRUIT.**—If any fruit trees remain not pruned it is not yet too late to perform that operation. Gooseberry and Currant-pruning must be completed as soon as possible. After pruning it is well to top-dress the bushes a little. To accomplish this, draw a little of the surface soil away with a hoe, then apply the manure, and finally soil the whole over about 2 inches deep.

**FLOWERS.**—This changeable weather is very unfavourable to flowers, and they will require much attention. If severe frosts set in, China Roses, &c., trained on the cottage trellis should have some protection, for, being in a forward state, they will be injured. Spring flowers, as Anemones, Tulips, Crocuses, &c., if any, must also be looked after and protected with fern or straw.

**PLANTS PROPER FOR WINDOW CULTURE.**—As the situation of these plants is different from what they occupy in their natural state, it becomes necessary to select such as are capable of accommodating themselves to circumstances; and as the unfavourable circumstances of house plants are chiefly want of free and pure air and of light, and in those species which are accustomed to long seasons of repose in the winter, the want of a uniform temperature, these circumstances must be kept in mind in the selection. Rooms, especially in crowded cities, are the most unnatural, and on that account the worst situations in which plants can be placed, and therefore, if healthy plants, and an abundance of bloom are sought, variety must be sacrificed. Plants which will continue healthy for a long time in the confined air of rooms are generally those which have a peculiar surface or texture in the foliage, such as many of the Aloes, Cactuses, and Mesembryanthemums, among what are called succulent plants.—W. KEANE.

## LOCAL PLANTS.

MANY years have passed since in a far distant land the writer of this delivered, among other botanical lectures, one on "Local Plants." He referred to *Primula imperialis*, only found on Pangerango Mountain in Java, in the damp shade of thickets at an elevation of 9000 feet. He referred to the Kerguelan Cabbage, which a naval friend said was found nowhere except on that island.

The Sea Pink and Scurvy Grass are found only on the seashore and summits of our Highland mountains—evidence that these were once islands enclosed by the sea.

*Saxifraga cernua* is found nowhere in Britain except on the

summit of Ben Lawers; there also occurs, and nowhere else in the world, the Lichen *Verrucaria Hookeri*; there also, and nowhere else, occur the Moss *Gymnostomum caespitosum*. *Draba rupestris* and *Alsine rubella* occur nowhere in Britain except here and in a place of Sutherlandshire. *Oxytropis campestris* is found in Britain only on one cliff, of Clova, in the Braemar Mountains; *Trifolium Boceoni* only on the Lizard in Cornwall. So in other lands there are hermits of the vegetable world, which prefer being separated from all their relatives. Examples of these are the Sicilian Horehound (*Marrubium peregrinum*); the Blue-bottle Thistle (*Carduus*

*cyanoides*); the Crimson Grass Vetch (*Lathyrus Nissolia*); the Elegant St. John's-wort (*Hypericum elegans*); and the Heath-leaved Sun Rose (*Helianthemum Fumana*). These and some others, it has been well observed, "stand quite insulated, and seem as if they would disappear, did not Nature, in a manner often inexplicable, provide for their continuance." But the most remarkable we have not yet mentioned—namely, *Forstera sedifolia*, on the summits of the loftiest mountains of New Zealand; *Melastoma tidorensis*, on the crest of Mount Tidor, in the Molucca Islands; and *Disa cornuta*, on a few spots near the summit of Table Mountain. Whole natural orders are

Aloe.

Mescal Cactus.

Melocactus.

Cactus, or Gaus.

## MEXICAN CACTI.

similarly limited in their places of growth. Meyen observes that the singular group of the Cactaceæ is properly peculiar to the torrid and subtropical zones of the New World; two species only have yet been found in East India and China, and there in the interior of the country, at considerable altitudes. However, the form of the Cactus has its representative in the Old World; for on its eastern, as well as its western side, we have Euphorbiæ, which we should certainly consider Cacti were we without the knowledge of their organs of fructification; as *Euphorbia nerifolia* in Southern China, which the *Ipomœa Quamoclit* twines round and decorates with its scarlet flowers, just as *Loranthus aphyllus* does the *Cerei* of Chili. *Euphorbia canariensis* and *Euphorbia balsamifera* represent the Cactaceæ in the western part of the Old World. It is equally inexplicable why the Old World only should pos-

sess the true *Ericæ*, while the *Erica corulca*, not a true *Erica*, comes in their place in the New World.

The mention of the Cactaceæ reminds us of another of their peculiarities. No artificial treatment, no other quarter of the globe, can produce them of the same gigantic growth as in the places of their nativity. We see them in their pigmy forms in the Royal Horticultural Society's conservatory, and we have seen them larger in the stoves of England and in the Calcutta Botanic Garden, yet there they are all dwarfs compared with those seen in their Mexican places of birth. "It is to the genus *Cereus*," says Figuer, "that the gigantic species indigenous to Mexico and California belong. The stem of this vegetable wonder, flanked by its branches, resembles an immense candelabrum, 15 yards high. In the engraving\* we give

\* Figuer's "Vegetable World," Cassell's edition.

a representation of the gigantic *Cereus* of Mexico. The *Echinocactus*, originally from America, is frequently cultivated in this country. Its stems, clustered together in the shape of an egg or sphere, present longitudinal sides separated by straight furrows. These sides are furnished on their whole length with white cottonous excrescences, provided with short and spreading spines. It is from the centre of these thorny tubercles that the flowers spring. They are always large and beautiful, and last for many days. The *Echinocactus* of Otto, which is frequently cultivated, is indigenous to Mexico. The *Melocactus* has a globular, ovoid, or pyramidal stem, with the sides separated by straight furrows. This stem is surmounted by a kind of woolly, or rather hairy tuft, formed of very compact spines, from the axilla of which the leaves spring; they are very small, and ephemeral in their duration. The *Melocactus vulgaris*, cultivated in gardens as an ornamental plant, was originally from the Antilles.

"Lastly, we must mention the *Mammillaria*. The thorny tubercles of this *Cactus* are spirally disposed round the stem. The flowers, which last a long time, often surmount the trunk, forming a kind of crown to its branches."

## DOINGS OF THE LAST AND PRESENT WEEKS.

### HARDY FRUIT AND KITCHEN GARDEN.

DURING the present mild weather an opportunity will be afforded to push forward the nailing. In most places the old system of training trees with nails and shreds is still followed, although in many new gardens the walls have been wired, the aid of nails being dispensed with. In the matter of nailing and tying trees out of doors the state of the weather must be studied. Where there is much wall space, some of the work may have to be done in unsuitable weather, but men cannot do such work in a frosty wind with satisfaction to themselves or their employers. Where walls for the finer sorts of fruit, especially *Peaches* and *Nectarines*, can be covered with glass a great advantage is gained, as not only can the work be done under shelter, but even if there is no heating apparatus there is the greater certainty of a crop, which will be very far superior as regards quality to that ripened out of doors. In many places, and especially where the soil is light with a gravel subsoil, *Peaches* and *Nectarines* out of doors are a very precarious crop. The best fruit we have seen from open walls has been in gardens where the soil has been of a good depth and a clay subsoil.

Many gardeners do not nail their *Peach* trees until March, they wait to see where the flower buds will be most abundant; but a little experience will soon teach the cultivator which class of wood to remove at the time of pruning. The wood ought not to be too thickly placed, all gross shoots should be cut out at the base, and only the medium shoots cut back—that is, those which are furnished with triple buds, in which case the triple bud will usually be a wood bud, and it can readily be distinguished by its form, which is elongated and pointed. In pruning always cut back to such a bud. The smaller shoots are seldom furnished with wood buds except one at the point of the shoot, so that if these shoots are cut back there will be no growth beyond any fruit that may set upon them, and the fruit would not come to perfection. *Peach* trees ought to be removed entirely from the walls and be nailed afresh, and if it is necessary to use any of the old shreds they should be dipped in boiling water first. Begin by nailing in the main branches, filling in the intervening spaces with bearing wood, and training some young growth to cover the naked stems of the old wood.

Our own work has been finishing pruning the fruit-tree borders and digging the ground. We had a reserve of some rich loam that had grown *Melons*, a dressing of this was placed over the surface of the ground first. If digging and trenching are behindhand, all such work ought to be rapidly pushed forward, and any alterations or planting to be done must be seen to forthwith.

### FRUIT AND FORCING HOUSES.

Early *vineries* now require attention. In our own houses the most forward growths have been trained and stopped; this work should be done in time and with care. The best way is to fasten one end of a strand of matting to the spur, and attach the other tightly to a wire in the direction the shoot has to be trained. The growing shoot can then be tied to this with a strip of matting, bringing it down to its place gradually; if the growths are tied down too closely at first many of them will snap off. By the time they are long enough to tie down, the temperature may be much increased. If it is desirable to get the *Grapes* ripe as early as possible, the minimum temperature may be 65°, rising in dull cloudy weather to 70° by day, and with sun heat to 75°. When the growths have pushed about 5 or 6 inches will be a suitable time to give the border a second good watering, and before doing so if it was not done after the first watering, spread some rotted manure over the surface of the border, so that the water may wash nutriment down to the

roots. Syringe the walls and damp the paths twice daily, as well as allow water to evaporate from troughs over the pipes. Do not syringe the *Vines* after they start into growth.

Cut all the fruit from the *Vines* in late houses. The method pursued is this: Three or four bits of charcoal are placed in clear and clean bottles, which are then filled to within an inch of the top with clear rain water; a string is attached to the neck of each bottle, so that it may be fastened to a rail fixed a little above the shelves of the fruit-room. The bottle is allowed to hang in a slanting position to allow the bunch of *Grapes* to be clear of the shelves. All the bottles are first placed in position; and as the *Grapes* are cut with the branch attached, the bunches are conveyed to the fruit-room, and the end of the branch inserted in the water at once. *Lady Downe's*, *Gros Guillaume*, and *Muscat of Alexandria* are the sorts which have been bottled this year. *Lady Downe's* seems as if it would keep well; very few decayed berries have been removed. The other two sorts will not keep so long, as the footstalks begin to wither. As soon as the bunches were cut the *Vines* were pruned, all loose bark removed, and they were then dressed with the usual composition.

*Mushroom House*.—Beds in bearing must not be allowed to become dry. If the bed is dry, as probably it will be, water with rain water some degrees warmer than the temperature of the house. It is not desirable to give the beds a soaking, merely a moderate watering. *Mushrooms* are sometimes tough at this time of the year, when much artificial heat is required. This is invariably owing to two causes—viz., the beds not having enough water, or overdryness in the atmosphere of the house. Water or syringe the paths, walls, &c., as often as they become dry, which sometimes will be once a day, at other times once a week. The *Mushroom* house is generally on the north side of a garden wall, so that it is not usually a dry place. A thermometer to test the bottom heat should be placed in all beds where the spawn has commenced to run, and should the temperature of the bed fall below 65°, a covering of dry oat straw may be placed over the bed, which will be the means of keeping up the temperature. It should always be borne in mind that there is much more danger of the spawn being destroyed by too much than there is by too little heat, and the beds had better be too dry than too wet. Those who possess a good *Mushroom* house need not fail to have a bountiful supply of *Rhubarb* and *Sea-kale*, which may be introduced to this structure as has been previously directed. *Chicory* and *Dandelion* roots may also be potted and placed here to blanch; they are at least wholesome additions to the salad.

See that there is a continuous supply of *Mint* and *Tarragon* from the early *vinery* or other forcing house. Cook will be sure to ask for it if there is none. *Mustard* and *Cress* sown once a week in boxes will maintain a continuous supply from the same source.

### PLANT STOVE AND GREENHOUSE.

The smaller plants in the stove will require repotting, especially those that are intended to form specimens. Nothing injures a plant so much as allowing it to become pot-bound. It is early yet, and only those plants that really do require a shift should have it now, and the potting must also be done with care. Many of the hardwood stove plants succeed best in a compost of turfy loam and turfy peat, one part of the former to four of the latter; leaf mould and rotted manure are best omitted. The pots, as well as the crocks, should be quite clean; the latter should be laid in carefully at the bottom of the pots, the larger potsherds being placed under, and finishing off evenly with smaller pieces. Some fibrous peat quite free from loose mould should be placed over the drainage; indeed, too much care cannot be taken in potting all classes of valuable plants to see that the drainage is perfect, and this must be looked after at the time of potting, as it is almost impossible to remedy any defect afterwards. The potting material for all stove plants should be porous; silver sand added to the soil will effect this.

It is desirable in all houses to have an edging of small plants to the stages. These are best grown in 5-inch pots, but the plants must not remain too long in the same pots, otherwise they assume a sickly appearance. The best plants for this purpose are some of the *Selaginellas*, such as *apoda* and *denticulata*. Some of the *Adiantums* are equally well adapted, especially *A. cuneatum*. Small plants of *Gymnostachyum Verschaffelti* and *Sonerila margaritacea* intermixed, make a charming line; they must all be kept in healthy growth by frequent potting in suitable soil. We have been re-arranging the plants in the greenhouse, and now that forced flowers are coming in there will be no lack of bloom. *Cinerarias*, where the seeds were sown early and the plants have been well cared for, will now make a good show with their brilliant colours; the flowers will be all the brighter and open better if assisted with a little manure water when the pots are full of roots. The water must not be strong, otherwise it will injure the plants by causing the branches to die-off. The tree *Carnations* have not failed to give us blooms all the winter. Most of the leading flowers have a

tendency to burst; this is prevented by tying with a strip of matting, or using small indiarubber rings. The above and Cyclamens ought to be grown by all who have a greenhouse without the advantage of forcing houses to bring plants into early flower.

#### FLOWER GARDEN.

The grass has been growing freely on the lawn, and has an untidy appearance; on the first favourable opportunity we shall run the lawn-mower over it. Potting Zonal Pelargoniums from the boxes in which the cuttings were struck into 60 sized pots. It is now time to see that Verbenas, Lobelias, Alyssum, Ageratum, &c., are propagated if there is not sufficient; and even if there is stock, such subjects as Verbenas succeed best from spring-struck cuttings. Coleus, Iresine Lindeni, and the Alternantheras, especially *A. amara*—this last the prettiest, but the most difficult to grow—should be in a house where the night temperature is about 55°.—J. DOUGLAS.

### TO CORRESPONDENTS.

N.B.—Many questions must remain unanswered until next week.

**DORLE-FLOWERING STOCKS (B. W.).**—Any of the florists who advertise in our columns could supply the young plants. Write to them.

**CEDRUS ATLANTICA (D. M.).**—Mr. Gordon, in his "Pinetum," says it is "a noble tree, like the Cedar of Lebanon, growing from 80 to 100 feet high, with horizontal branches, and a tabular-shaped head, but rather open in appearance. It is found on the highest mountains in Barbary, particularly on the famous Atlas range in Northern Africa, at an elevation of from 7000 to 9000 feet, in great abundance, and is quite hardy, and more rapid in growth than the common Cedar." It was introduced in 1843.

**PINUS MAGNIFICA (Idem).**—This was discovered by M. Roez in 1858. Gordon adds:—"This magnificent tree grows from 110 to 130 feet high, with a most regular appearance, and merits its name on account of its grand foliage, forming great plumes at the ends of the shoots. It is found on the mountains of Morshia, in Mexico," and is the same as *Pinus Devoniiana*.

**BREMEN INTERNATIONAL EXHIBITION (H. Outgies).**—You had better have it advertised.

**WORKMAN'S FLOWER SHOW (G. E. C.).**—In No. 538 of this Journal we published rules for village horticultural societies. You can have a copy if you enclose four postage stamps with your address.

**ROSE PIERRE DE ST. CYR—PEARS (C. R.).**—Pierre de St. Cyr is a hardy and late-blooming Rose, but there are so many kinds of finer quality it is hardly worth a place among better Roses. Four Pears for south wall in the north—Jargonelle, Marie Louise, Gansel's Bergamot, Hacon's Incomparable. Four for dwarf standards—Louise Bonne de Jersey, Seckle, Comte de Lamy, Williams's Bon Chretien.

**WARLENERGIA GRANDIFLORA (M. A. W.).**—It has been known here for nearly a century. It is portrayed in the fourth volume of the "Botanical Magazine," where it is fully described as a hardy perennial, a native of Siberia and Tartary, introduced by Mr. John Bell in 1782. It was then called a Campanula, and now some botanists consider it a Platycodon.

**GARDENIAS IN WINTER (Julia).**—They should now be kept rather dry giving no more water than sufficient to keep the leaves fresh. In February you may place them in your small forcing house, giving them if possible a mild bottom heat; and if kept moist, gently sprinkling overhead twice daily, they will swell their flower buds kindly; and when the flowers show colour discontinue the sprinkling overhead. If the plants are not straggling do not cut them down, as it will destroy this year's crop of flowers. A few plants started at intervals of a month or so up to April will afford you a good succession of bloom. Keep moist after flowering and until the growth is made; then keep drier, or remove to a cooler and drier house.

**TOMATOES IN PITS (A Very Old Subscriber).**—As the bedding plants are out of the pits by the end of May, you may, by planting out strong plants of Tomatoes, then, have in your unheated pits a fine crop of fruit late in summer and in autumn. The seed should be sown in March in a hotbed, and the seedlings, when showing their second leaves, ought to be potted off singly in small pots, and returned to the hotbed, shading from bright sun for a few days. Keep them near the glass and only moderately supplied with water, and when the pots are full of roots shift into 6-inch pots, and place near the glass in a house with a gentle heat, or in a hotbed; when about 9 inches high remove to a house or frame safe from frost, and gradually harden-off. Plant-out in the pits as soon as you can, and do not stop the plants, as it only retards their growth, but train the shoots to the lower part of the wall right and left, and this will give you shoots for covering the upper part of the wall; when this is nearly completed keep the plants dry, and they will soon begin to flower. They must then be watered abundantly, stopping the shoots one joint beyond the fruit. The lights ought to be kept on throughout the summer, admitting air as required at 75°, and to keep the temperature from exceeding 90°, shutting-up at 75°. You may have a row of plants at 3 feet apart along the centre of the pit, and the shoots may be allowed to run on the ground or be supported with stakes. Orangefield Dwarf we should have for the centre of the bed, and Hathaway's Excelsior for the back wall. We cannot say whether Tomatoes or Ridge Cucumbers would pay the better. Consult a greengrocer, who will tell you what likelihood there is for a demand for Tomatoes. In large towns they usually sell well.

**POULTRY DUNG (W. S.).**—On no account heat it as you propose, for it would drive off much of the ammonia. It is good for all crops, and may be spread very thinly (4 ozs. to the square yard) over the surface previously to digging, or it may be dissolved in water, 2 ozs. to the gallon, and used as liquid manure.

**BRIAR STOCKS PLANTING (A. E.).**—The stocks may be planted in rows 2 feet 6 inches to 3 feet apart, and the stocks 9 inches to a foot apart in the rows. The soil is the worst possible for the Briar, which requires stiff land, but it may be improved by manuring. The situation, if not much shaded, will answer. You may have a row of early Potatoes between each row of Briars. The stocks will be fit to bud in July, at least the majority of them. Manetti stocks may be planted in rows 2 feet apart, and the stocks 8 or 9 inches apart in the rows.

**EVERGREEN TREES VERY EXPOSED (H. W.).**—Silver Firs require shelter. The Corsican Pine (*Pinus Laricio*) will suit you. It grows rapidly after it becomes established, often a very little less than a yard in a season. The Austrian Pine (*Pinus austriaca*) is of denser habit, but not of such rapid growth as the Corsican Pine. If you could have two rows we would have Corsican Pine at the back and the Austrian Pine in front planted quincunx fashion. This would give you a much better shelter than one row only.

**TREES FOR CONCEALING BUILDINGS (Seewoaks).**—You do not say whether you wish for evergreen or deciduous trees. We would not have any of the latter, but should plant two rows of Corsican Pine at the back and two lines of the Austrian Pine in front, and face them with evergreen shrubs, as Hollies, Yews, Portugal and common Laurel. This would give you a much better screen than deciduous trees, which would probably grow quicker; kinds of these that would suit are Sycamore, Lime, and Elm. Pophurs are of quicker growth but not nearly so twiggy as the others, which is of consequence in winter. You could plant the Sycamore, Lime, and Elm at 8 feet apart, and have every alternate plant and row evergreen shrubs, as Hollies, Yews, Portugal and common Laurel, with a line or two in front, so as to give a cheerful appearance to the screen in winter.

**FRUIT TREES ON A SOUTH WOODEN FENCE (Idem).**—Being close-boarded and smooth it will answer for Plums, also for Cherries and Pears. Plums suitable are Belgian Purple, Coe's Golden Drop, Early Favourite, and Jefferson, to which you may add Green Gage, Golden Gage, and Transparent Gage, which are excellent for dessert; for culinary purposes Mitchelson's, Pond's Seedling, Prince Englebert, Victoria, and Yellow Magnum Bonum. The Plums ought to be 20 feet apart. Cherries we should have on the Mahaleb stock and plant 12 feet apart, or on the common stock and plant 20 feet apart. Kinds suitable are Empress Eugenie, May Duke, Archduke, Bigarreau Napoleon, Elton. Pears on the Quince stock, which you may for horizontal training have at 12 feet apart, or upright-trained 6 feet apart—Citron des Carmes, Beurre de l'Assomption, Beurre d'Amanlis, Madame Treve, Colmar d'Etr, Beurre Superfin, Gratioli, Conseiller de la Cour, Van Mons L'ou le Clerc, General Todleben, Glou Morceau, Beurre Biel, Beurre Bachelier, Josephine de Malines, Marie Louise, Ne plus Melis, Beurre de Rance, Bergamotte Espereu, Passe Crassane, and Madame Millet.

**RENEWING HEAT OF CUCUMBER BED (C. S.).**—Your pit has solid brick walls, and to place linings of hot dung against those would be practically useless for increasing the temperature of the bed, as the heat of the dung will not pass through the brick walls. The case would be different if the walls of the pit, back and front, were pigeon-holed from the ground to within 18 inches at the back, and 15 inches at the front of the wall plates; or if your pit be a lean-to from the stove, the front wall ought to be pigeon-holed, and there should be a supporting wall in front, the lining pit being 2 feet 3 inches clear of the brickwork. This, kept full of hot dung, would give you the heat needed, the heat passing through the pigeon holes to the bed.

**STRIKING CUTTINGS OF GERANIUMS (Idem).**—It is not too early to strike cuttings of bedding Geraniums; they may be put in from the present time up to the middle of March. A cucumber house is too hot for autumn-struck Geraniums, but would answer well for striking the cuttings.

**TREES FOR HEATH INFESTED BY RABBITS (M. A. H.).**—Where rabbits abound, the only tree we find suitable for a high and exposed position is the Corsican Pine. It is of quick growth, and rabbits do not interfere with it. Scotch Fir succeeds well in such a position, also the Austrian Pine, but rabbits bark them repeatedly. Plants a foot to 15 inches high are better for an exposed situation than larger ones, and for that size holes should be made about 15 inches square. In planting, care should be taken to place some line soil under and over the roots, planting firmly, and only as deeply as they previously were.

**BUTCHER'S BROOM PROPAGATION (An Old Subscriber).**—If the berries have sound seeds these will germinate if sown in light sandy soil in a sheltered place out of doors, covering them about three-quarters of an inch deep with fine soil. The plants may in part appear above ground the first season, but usually not until the second year. We do not know that the plant is propagated by cuttings, but the most common mode of increase is by suckers and division, securing to each division one or more growing points or buds, which you will find at the base of the present growths. From now to April is a good time for dividing it. It is one of the best of subjects for planting under trees.

**ACACIA FOR TOP OF CONSERVATORY WALL (H. E.).**—For so high a wall as 30 feet we do not think the Acacias would suit. A Julibrissin is the highest-growing we know, but *A. coccinea*, *lapantha*, and *longifolia* are more suitable, the latter being very fine. *Tasoua Van-Volkemi*, which we have considerably over the length you name, would be very suitable for the upper part of such a wall, also some of the *Passifloras*, as *P. Contessa Nesselrode*, also *Dignodia Tweediana*.

**BLOOD AS A MANURE (Provincial).**—It is a very powerful manure. Mix it with earth, and apply it fresh.

**CHYMOCOCCA EMPETROIDES (H. G.).**—It is a genus of Thymelaceae, founded on a Cape plant by Meisner in De Candellos' "Prodromus," xv., 665. It is a small shrub, lazily and profusely branched, much resembling *Passerina* *iliformis* and *P. rigida*. It is altogether like a *Passerina*, except in having a globose, fleshy, probably red berry as large as a small pea. There is no book that includes "a complete list of florists' flowers and their different varieties." Such an enumeration would fill a thick folio volume.

**PHLOX MISS ROBERTSON.—Mr. J. Cocker, nurseryman, Aberdeen, informs us that this Phlox was raised by him, and not by Messrs. Carter, as stated in "The Gardeners' Year-Book."**

**VINE MILDEW (S.).**—If you have drained the border you have done all that can be done to destroy this pest. The best compound for you to use as a winter dressing is sulphur and soft soap, with a little tobacco liquor. Should the mildew appear during summer, dust the leaves with flowers of sulphur as soon as it is perceived. If you linewash the walls of the vinery, add 2 lbs. of sulphur to each pailful of the wash.

**PRUNING FIG TREES (Idem).**—The best time to prune them is late in the spring, but the overluxuriant shoots ought to have been stopped in summer, which would have caused two or three smaller fruit-bearing shoots to have formed.

**EPACRIS AND HEATHS PROPAGATING (J. H.).**—*Epacris* are propagated by cuttings of the tips of the shoots when about 2 inches long in spring or early summer, and *Heaths* are propagated by cuttings of the young shoots during summer, when they can be handled easily, and are 2 or 3 inches long. The pots for the cuttings should be half filled with drainage, and to within

half an inch of the rim with very sandy peat and silver sand, pressing firm. Water and press firm, and fill up to the rim with silver sand, and after standing a day water again and press; after six hours put in the cuttings round the sides about an inch apart, covering with a bell-glass or hand-glass, and place in a close pit or frame shaded from sun. Air should be admitted when the cuttings begin to grow, a little at first, increasing the amount by degrees. The main point is to keep them from damping, and yet maintain a close, moist atmosphere. You will find the propagation and treatment of the most desirable greenhouse plants in "The Greenhouse," which may be had free by post from our office for 10d.

**SOWING BRIAR HEPS (J. Bentley).**—Dividing the heps, sow the seeds in moderately rich soil out of doors, and cover three-quarters of an inch deep with fine soil. The situation should be open, and some of the plants may come up the first year, but more will come up the second. The seedling plants may in autumn be taken up and put out in nursery rows 1 foot apart, and the plants 3 or 4 inches apart in the rows. In two or three years they will be fit for budding for dwarfs.

**FORCED VINES FOR PLANTING-OUT (G. W. P.).**—Vines that have been forced are not suitable for planting, but they may be cut down to within a few inches of the soil, and a new and strong cane being produced, they are then eligible for planting-out; but we prefer young canes that have not been fruited. They start more freely, and sooner become established.

**MOSSY LAWN (J. T. S.).**—From now to the end of March, in mild weather, have the lawn well scratched with a new iron rake, moving it to and fro with force, so as to bring up and remove the moss. The more you remove the better; clear it off. In March give a good dressing of rotten manure or rich compost, spreading it evenly, and not more than half an inch thick. In April rake again well with the iron rake, removing any rough and unsightly portions of the manure and any stones, and with an early prospect of rain sow over it evenly 8 lbs. *Festuca duriuscula*, 12 lbs. *Cynosurus cristatus*, 8 lbs. *Festuca tenuifolia*, and 8 lbs. *Poa nemoralis sempervirens*, 8 lbs. Trifolium repens, and 4 lbs. Trifolium minims, in mixture for 1 acre. If you are troubled with birds, rake lightly with a wooden rake after sowing; if not, simply roll well; rolling should also follow the raking. Let the grass grow until the middle or end of May, then mow with a scythe, and afterwards keep under with the mowing machine. If the lawn is wet the moss would be doubly aided by draining.

**DOLYCHOTERIS NOBILIS UNHEALTHY (L. M. S.).**—Your plant is probably kept too cool. It requires to be grown in a stove, and not only to be kept moist, but kept moist all round. We should repot it, and keep moderately moist for a time, or until it grows freely, then water abundantly; but it will not thrive unless you give it the temperature of a stove, or, at this season, 55° to 65° at night, and 60° to 65° by day.

**CHRISTMAS ROSE CULTURE (L. A.).**—Leave the plant where it is, and mulch round it with some partially-decayed leaves or rotten manure. You may divide the plant in spring, planting out in good, rich, light soil in a slightly-shaded border, and watering freely until the leaves turn yellow; but we do not advise dividing the plant unless it is large. As you want flowers at Christmas, we should not divide the plant unless you had a certainty of good divisions. We should procure plants now, which may be had through the principal nurserymen advertising in our columns, and plant them out in a border as above named. At the end of September, or early in October, take up with good balls, placing in pots large enough to hold the roots nicely, using light fibrous loam, with a third of leaf soil, and assigning them a light airy position in the greenhouse. By this mode of treatment you may have them in flower at the time required. *Helleborus niger maximus* and *H. niger minor* are very desirable kinds, the latter flowering rather earlier than the former. For flowering at Christmas the Roman Hyacinth is good, having pure white Lily-of-the-Valley-like bells. Beyond Camellias and Epacris the Bride, we do not know what other white flowers would suit, except Primulas, especially the double white *Primula humbriata alba flore-plena*. White Camellias are *Alba plena*, *Comtesse Calini*, *Fimbriata*, *Mrs. Percival*, *Mathotiana alba*. You may have fine blooms of *Chrysanthemums*, growing the plants out doors up to October, and then removing to the greenhouse. White-flowering kinds:—White Beverley, *Carissima*, *Countess of Granville*, *Empress of India*, *George Peabody*, *White Globe*, *Hetty Barker*, *Isabella Eolt*, *Madame Domage*, *Miss Marchaux*, *Mrs. G. Rundle*, *Norma*. These are large flowered Pompons: *Marabout*, *Mlle. Martha*, *Modelle*, and *White Trevenna*. You will need to keep them cool, in order to have them in flower so late.

**LAPAGERIA ROSEA PLANTING OUTSIDE (A. B. P.).**—The *Lapageria* would not suit for planting in a border outside the conservatory, as the shoots come directly from the root, and it would not answer to cut those away to encourage the development of the other shoots. Could you not make a border, and so plant inside the house? You would have a much better result.

**CYCLAMEN SEEDLINGS NOT THRIVING (A Puzzled Amateur).**—In your greenhouse, in which *Primulas*, *Heaths*, and *Camellias* thrive, *Cyclamens* ought to flower well, and we can only conclude you have erred in their summer and autumn treatment. In "The Greenhouse," which you can have by post from our office for 10d., you will find full particulars of the treatment of *Cyclamens*. Your treatment must be very singular, as you write of "some comms uncovered, some covered, some nearly dry, some seldom watered, others more freely." But you furnish us with no data to enable us to judge whether your treatment is right or not.

**APPLE TREES BARKED BY SHEET (J. D.).**—As your trees are seven or eight years old, they have mostly good-sized stems, and as sheep rarely bark trees so completely as rabbits, we expect that enough of the inner bark is left to enable the trees to recover. We would not advise anything being done to them, excepting, perhaps, wrapping them round with hay or straw bands to keep out the cold; but if severe weather occur before this is done, we would hardly take the trouble to do that, as in any case it ought to be removed in April. Healthy vigorous trees have the power of remedying many evils arising from accidents, and this being one, we would not by any means regard the trees as hopeless, unless the bark is gone wholly, and even then we would not give them up. We do not approve of any kind of dressing, especially anything of an acid or caustic nature; but if their appearance is offensive, you might paint them over with ordinary mud or clay, if it contains nothing hurtful to vegetation. Healthy vigorous trees outlive a good deal of bark-gnawing. Usually it is the repetition of the injury that kills. We have plenty of instances of the latter.

**LIME WATER FOR EXPELLING WORMS (T. G.).**—Use clear lime water, made by placing 1 lb. of fresh-slaked lime in three gallons of water, stir-up in a cask, allow the whole to stand forty-eight hours, then stop the holes in the pots with clay, and deluge the soil with the clear liquid. The holes in

the pots should be opened after the soil has been flooded with the lime water three hours. The lime water does not injure any Ferns that we have employed it for, and we do not think it would hurt yours.

**WORMS IN BULB POTS (S. T.).**—Water with lime water.

**NAME OF GRASS (A Working Lady).**—The dried specimen of grass you sent us is, we think, *Eriophorum laticaulum*, a very fine silvery-plumed sort, but not equal to the Pampas Grass. A bulbous plant, popularly known as "the Onion Plant," we do not know, nor can we make out from your description. Send us a flower when the plant comes in bloom.

**NAMES OF PLANTS (J. G.).**—*Chimonanthus fragrans*, Japan Allspice. It was introduced from China by Lord Coventry in 1739. (*F. W. L.*)—*Palomita fruticosa*, Jerusalem Sage.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### BRISTOL POULTRY SHOW.

THIS was held on the 16th, 17th, and 19th inst. in the Rifle Drill Hall. The entries of poultry amounted to upwards of 850, those of Pigeons to some 200 more. A full report from the pen of "WILTSHIRE RECTOR" will appear next week. The following awards were made:—

**DORKINGS (Coloured).—Cockerel.**—1 and 2, L. Patton, Billmore, Taunton. 3, T. C. Burnell, My-hel-lever. *he* and *c*, Mrs. Wollocombe, Stamford Rectory. **Pullets.**—1 and 2, Mrs. Henry Lingwood, Needham Market. 3, W. W. Rutledge, Kendal. 3, A. Darby, Bridgnorth. *he*, Mrs. E. Willecox, Nailsea Court (2). *c*, L. Patton.

**DORKINGS (Coloured).—Cock.**—1 and 2, Cup, Mrs. Wollocombe. 2, Rev. H. F. Hamlyn, Combe St Nicholas. 3, J. Longland, Grendon. *Hens.*—1 and 2, L. Patton. 2, J. Longland.

**DORKINGS (Silver-Gray).—Cockerel or Cock.**—1, O. E. Cresswell, Early Wood, Ragwort. **Pullets or Hens.**—1, O. E. Cresswell. 2, W. W. Rutledge. 3, L. Wren, Lowestoft. *he*, Rev. T. E. Cato, Wye Vicarage.

**COCHINS (Cinnamon and Buff).—Cockerel.**—1 and 2, W. A. Barnell. 2, Mrs. A. Tindal, Aylesbury. **Pullets.**—1, Mrs. A. Tindal. 2, A. Darby. 3, W. A. Barnell. **COCHINS (Cinnamon and Buff).—Cock.**—1 and 2, Lady Gwydyr, Stoke Park, Ipswich. 2, C. Taylor, Gloucester. 3, A. Dickinson, Dextington. *Hens.*—1, Mrs. A. Tindal. 2, H. Feast, Swansea.

**COCHINS (Brown and Partridge).—Cockerel or Cock.**—1, G. Shrimpton, Leighton Buzzard. 2, T. Stretch, Ormskirk. 3, C. Taylor, *he*, Hon. Mrs. Sugden, Wells. *c*, W. A. Barnell. **Pullets and Hens.**—1, F. Wilton. 2, G. Shrimpton. 3, T. Stretch. *he*, J. K. Fowler, Aylesbury. *c*, Hon. Mrs. Sugden. *c*, Taylor.

**Game (White).—Cockerel or Cock.**—1, R. W. Beachy, Fluder, Kingskerswell. 2, W. Whitworth, jun., Long-itch. 3, W. A. Barnell. *he*, Mrs. A. Tindal. 3, Bloodworth, Cheltenham. *c*, J. Turner, Bath. **Pullets or Hens.**—1, Cup, and 2, R. W. Beachy. 3, C. Bloodworth. *he*, Lady Gwydyr. *W. Whitworth, jun.*; *W. A. Barnell.*

**BRAHMS (Dark).—Cockerel.**—1 and 2, H. Lingwood. 3, L. Wright. *he*, T. H. Waterman, Anderton, Cornwall; *c*, J. Evans, Keyham (2). *Hon. Mrs. A. B. Hamilton, Bidderoot, Woburn*; *c*, T. Water, Keynsham. *L. Wright* (2). *G. Jones, Goldthorn Hill, Wolverhampton.* *c*, H. B. Morrell, *Laemaur, Clyro*; *Hon. Mrs. A. B. Hamilton*; *J. Evans* (2). *E. Ensor, Bristol.* **Pullets.**—1 and 2, L. Wright. 2, H. Lingwood. 3, Rev. J. D. Peake, Lateham Vicarage. *he*, H. B. Morrell (1); *J. Evans*; *L. Wright*; *H. Lingwood*; *he*, *L. Pritchard*; *T. Denhall, Wolverhampton*; *H. B. Morrell*; *W. Birch, Banualc, Coventry*; *G. Jones*; *T. F. Ansell, Cowley Mount, St. Helens*; *c*, J. Evans. **BRAHMS (Light).—Cock.**—1 and 2, Cup, Newnham & Manby, Wolverhampton. 2, F. J. Cotterell, Birmingham. 3, Rev. A. Van Straubenzee, Tettenhall Vicarage. *he*, *W. H. Crabtree, Levenshulme*; *he*, *J. T. Panton, Gloucester*; *J. Evans*; *Hon. Mrs. A. B. Hamilton*; *E. Ensor*; *W. Martley, Early, Slapton*; *L. Wright.* *Hens.*—1, H. Lingwood. 2, J. Evans. 3, T. F. Ansell. *he*, *H. B. Morrell.* *he*, *F. J. Cotterell*; *T. F. Ansell.* *c*, *L. Pritchard.*

**BRAHMS (Light).—Cockerel.**—1 and 2, Cup, T. A. Dean, Marple, Hereford. 2, P. Holmes, Palegrave, Biss. 3, F. J. Cotterell. *he*, *M. H. Moseley, Markgate street.* *he*, *Mrs. A. Williamson, Leicester* (2); *F. J. Cotterell.* *c*, *Mrs. A. Tindal.* **Pullets.**—1, Cup, and 2, Mrs. A. Williamson. 2, T. A. Dean. *he*, *P. Haines*; *J. Turner*; *H. Draxcott, Leicester*; *E. Ellis, Cheltenham*; *W. H. Crabtree.*

**BRAHMS (Light).—Cock.**—1 and 2, Cup, M. Leno. 2, H. M. Maynard, Holme-wood, Ryde, Isle of Wight. 3, Mrs. A. Williamson. *he*, *Mrs. A. Williamson*; *W. H. Crabtree*; *J. Bloodworth, Cheltenham*; *J. Mitchell, Moseley, Birmingham*; *c*, *J. H. Rodbard, Wrentham.* *Hens.*—1 and 2, Cup, Mrs. A. Williamson. 2, J. H. Rodbard. 3, F. J. Cotterell. *he*, *Mrs. Turner, Avon, Ringwood*; *F. Crook, Forest Hill.*

**SPANISH.—Cockerel.**—1, Cup, and 2, J. E. Jones. 2, J. R. Rodbard. *he*, *J. Barry, Bristol*; *J. R. Rodbard.* *he*, *E. Jones*; *G. K. Chilcot*; *A. Darby.* *c*, *F. Cooper, Henley*; *A. Jones, Stapleton*; *J. R. Rodbard*; *Miss E. Browne.* **Pullets.**—1, Cup, and 2, J. E. Jones. 3, Mrs. E. Allsopp. *he*, *G. K. Chilcot, Cotnam*; *T. Bamfield, Brandon Hill, Bristol.*

**SPANISH.—Cock.**—1, W. E. Bull, Newport Page 1. 2, E. Jones. 3, T. Moore, West Gate Docks, Cardiff. *Hens.*—1, A. Darby. 2, Mrs. E. Allsopp. 3, E. Jones. *he*, *T. Bamfield.*

**HAMBURGERS (Gold-pencilled).—Cockerel or Cock.**—1 and 2, Cup, J. Buckley, Taunton, Ashton-under-Lyne. 2, H. Beldon, Goutstock, Bingley. 3, W. A. Hyde, Hurst, Ashton-under-Lyne. **Pullets or Hens.**—1 and 2, Cup, H. Beldon. 2, J. Buckley. 3, J. Robinson. *he*, *W. A. Hyde.*

**HAMBURGERS (Silver-pencilled).—Cockerel or Cock.**—1, Ashton & Booth, Macclesfield. 2, H. Beldon. 3, J. Fielding, Newchurch, Manchester. **Pullets or Hens.**—1 and 2, *he*, *J. Robinson*; *Lindley, Otley*. 2, J. Fielding. 3, Miss E. Browne. *he*, *Ashton & Booth*; *Miss E. Browne, Chardleigh Green.* *c*, *J. Carr, Swansea*; *H. Beldon.*

**HAMBURGERS (Gold-pencilled).—Cockerel or Cock.**—1 and 2, H. Beldon. 3, W. Speakman, Nantwich. *he*, *T. Edmunds, Jun.*; *E. Jones*; *W. J. M. Gregory, Weston-super-Mare.* **Pullets or Hens.**—1, Walker, Bristol; *Ripley*. 2, J. Robinson. 3, H. Beldon. *he*, *Weston-super-Mare.* *he*, *H. Beldon.* *c*, *C. Bloodworth, Cheltenham* (2).

**HAMBURGERS (Silver-pencilled).—Cockerel or Cock.**—1, Withheld. 2 and 3, H. Beldon. **Pullets or Hens.**—1 and 2, H. Beldon. 3, R. H. Roe, Swansea.

**HAMBURGERS (Black).—Cockerel or Cock.**—1, Rev. W. Serjeantson, Acton Emmanuel Rectory, Shrewsbury. 2, H. Maskery, Bow Hill, Leek. 3, H. Beldon. **Pullets or Hens.**—1 and 2, Rev. W. Serjeantson. 2, T. Bush, Bristol. *he*, *H. Beldon.*

**GAME (Black-breasted and other Reds).—Cockerel or Cock.**—1 and 2, Cup, S. Matthew, Stowmarket. 2, W. T. Lovering, Capra, St. Austel. 3, J. Cook, Worcester. *he*, *J. Palmer, Woburnbury.* *he*, *W. H. Stagg, Netheravon, Fenny (2)*; *J. Forsyth, Wolverhampton.* **Pullet or Hen.**—1, J. Cook. 2, S. Mathew. 3, C. Cotton, Sunningdale, Berks. *he*, *W. H. Stagg*; *H. L. tan, Otford*; *Rev. H. Helyar, Pendomer Rectory, Yeovil.*

**GAME (Other Varieties).—Cockerel or Cock.**—1, S. Mathew. 2, P. A. Beck, Galsburgh, Wexham. 3, G. Lunt, Market Drayton. *he*, *Dr W. K. Bullmore, Falmouth*; *H. Jaltan.* **Pullet or Hen.**—1 and 2, Cup, Hon. and Rev. F. Dutton, Windrush Rectory, Burford. 2, Mrs. A. Tindal. 3, H. P. P. Price, Castle Maloe, Brecon. *he*, *Mrs. A. Tindal*; *J. Oserd.*

**MALAY.—Cockerel or Cock.**—1, J. Hinton, Warminster. 2, F. Sabin, Birmingham.

**LINNET MULES.**—1, W. K. Magill. 2, J. Dowling.  
**BLACKBIRDS.**—1, P. Keating. 2, J. Carney. *chc.* J. Twomey. *hc.* W. O'Connor.  
**THRUSHS.**—1, L. P. Ryder. 2, J. Dowling. *hc.* R. Daly.  
**LAURELS.**—1, R. Daly. 2, L. P. Ryder. *chc.* C. P. Johnson; R. Jones. *hc.* R. Lane; L. P. Ryder. 3, R. E. Lane.  
**PABOTS.**—1 and 2, D. A. Bayly (King and Grey). *hc.* D. A. Bayly (Rosing and Rosella); F. Buck.  
**ANY OTHER VARIETY.**—1, J. Lloyd (Jay). 2, D. A. Bayly (Cockateel).  
 Medal for greatest number of points in Cage Birds.—L. P. Ryder.  
**JUDGES.**—*Poultry and Pigeons:* Mr. C. F. Staunton. *Cage Birds:* Mr. T. O'Grady.

## BROMLEY POULTRY SHOW.

This was held on the 13th and 14th at the Rifle Drill Hall. The poultry entries numbered 558, those of the Pigeons 200, and the Canaries 164.

In both the *Dorking* classes Mr. Lingwood deservedly obtained the first prize. We think it is not the first time these birds have carried off the double honours for their owner. The class for hens was a very good one, the competition being very close for the second and third prizes. *Cochins* followed, cock and hen together, and all the varieties crowded into one class. The entries numbered twenty-four: we hope this will encourage the Committee to do something better for them at their next show. Whites were first and second, Partridge third. The first-prize birds were an exquisite pair and well deserved their position. We were also very pleased with a pair of Blacks, highly commended, belonging to the Rev. J. G. B. Knight. The *Brahma* classes were all large ones. In Dark cocks the first-prize bird was a grand one, but out of condition; the second a big bird; the third mottled on the breast, but in all other points we like him as much as the winner. The hens, with the exception of the first-prize birds, we did not much like. The second-prize birds were good, but not well matched. The Light cocks, with a few exceptions, were only of moderate quality. The cup hens were good in size, well feathered on the leg, but deficient in markings. In the *Spanish* class a few good specimens were to be found. The first-prize cock was a neat bird and in good condition. The second pen was rightly placed, but we did not like the third. Had the cock in pen 15 been in better trim the position of these pens would have been transposed. The first prizes in both the *Game* classes were taken by Mr. Matthews with birds worthy of the owner's reputation. The *French* classes were both good; in *Houdans* Mr. Dring secured both prizes with birds that we have noticed on previous occasions. In *Crève-Cœurs* Mr. Wood was first with a good cock, but the second-prize pen contained the best hen. The *Hamburgs* were numerous, but we could only find two or three good pens. The Black Red *Bantam* class contained twenty-nine entries. The competition was close between the first and second-prize pens; the rest were very poor. The Brown Red class in quality was not better than the Black. In the *Any other variety* Mr. Entwistle showed two very beautiful pens of Piles, which were first and second. The class for *Any variety*, confined to the county of Kent, was a very interesting one, showing that Kent, which has taken the lead in so many of our English pursuits, is not behind in poultry-breeding. *Turkeys* were unusually well represented, and the classes for *Ducks* contained some admirable specimens.

The *Pigeon* classes generally secured good entries. The class for Pouters contained fourteen entries, and many extremely fine birds were to be found, a good Red winning. A capital class of Carriers followed, a grand Black cock of Mr. Maynard's winning in a very strong competition. In Barbs Mr. Maynard again carried off all the prizes. The Tumbler class contained only three entries. The Fantails were a delightful class; but we fear the yellow sand at the bottom of the pens would not improve their condition for future exhibitions. Jacobins deserve special notice. We could not find a bad bird in the class. Some large classes of Working Antwerps completed a very successful Exhibition.

**DORKINGS.**—Cocks.—1 and Cup, H. Lingwood. 2, Hon. J. Massy. 3, Viscount Turnour. *hc.* C. Hatchell. 4, C. Niven. *c.* F. Parlett; T. Charrington. *Hens.*—1, H. Lingwood. 2, H. Mills. 3, E. Wilson. *hc.* Viscount Turnour; J. H. Putney; Hon. J. Massy; H. Seed.  
**COCHINS.**—1 and Cup, Mrs. E. Pryor. 2, R. S. S. Woodgate. 3, T. W. Anns. *hc.* Rev. J. G. B. Knight; J. Sleep. 4, W. White; J. G. Dowker; Mrs. Brassy.  
**BRAHMAS.**—Dark.—Cocks.—1 and Cup, H. Lingwood. 2, H. W. Potter. 3, Mrs. J. G. Hepburn. *hc.* F. Hones; Rev. J. N. Heale; J. Watts. *c.* H. Giddard. *Hens.*—Cup, H. Lingwood. 2, T. F. Ansell. 3, J. Watts. *chc.* F. Lake; Hon. Mrs. A. B. Hamilton. *hc.* G. W. Potter; Hon. J. Massy; F. Lake; J. Palmer; J. W. Perkins; C. Niven. *c.* Mrs. E. Pryor; H. Kennett.  
**BRAMMAS.**—Light.—Cocks.—1 and Cup, H. Lingwood. 2, G. W. Potter. 3, Capt. W. S. Chavert; *hc.* Rev. F. T. Scott; Mrs. Haigh.  
**ANY OTHER VARIETY.**—Cup, H. M. Maynard. 2, Mrs. F. Chesire. 3, E. J. Reeves. *chc.* J. Long. *hc.* Rev. F. T. Scott; R. Bird. *c.* Rev. F. T. Scott.  
**SPANISH.**—1, Mrs. Tonkin. 2, E. J. W. Stratford. 3, Mrs. Allsopp. *hc.* F. James.

**GAME.**—Red.—Cup, S. Matthew. 2, J. Jeken. 3, F. Ward. *hc.* H. E. Martin; A. J. Matthews. *Any other variety.*—1, S. Matthew. 2, E. Rice. 3, F. Harding.  
**HOUDANS.**—1 and Cup, J. W. Noyle; 2, Rev. H. D. Dobson; *hc.* W. Cutlack, jun.; J. W. Noyle; Mrs. Vallance; J. Long. *c.* M. Sandford.  
**CREVES OR LA FLECHE.**—Cup, L. B. Wood. 2, W. Dring. 3, Mrs. Cross. *hc.* W. Cutlack, jun.; E. Randall; G. W. Hibbert; J. Walton.  
**HAMBURGHS.**—Pencilled.—1, W. Speakman. 2, G. J. Duckworth. 3, W. K. Tickner. 4, E. L. Stouham. *Spangled.*—Cup, W. A. Hyde. 2, G. J. Duckworth. 3, W. K. Tickner. 4, T. Walker, jun. *hc.* Ashton & Booth; C. Holstead; C. E. L. Lucas; J. T. Boulton; J. Ackerman. *Black.*—1, Rev. W. Sergeantson. 2, T. A. Wright. 3, R. S. S. Woodgate. T. Walker.

**GAME BANTAMS.**—Black Reds.—Cup, W. Boucher. 2, W. Adams. 3, W. F. Entwistle. *hc.* T. W. Anns. *c.* W. F. Entwistle; F. James. *Brown Reds.*—1, S. and J. J. S. ephens. 2, Miss F. Long. 3, W. F. Entwistle. *hc.* B. Mollett. *c.* W. S. Marsh. *Any other variety.*—1 and 2, W. F. Entwistle (Piles). 3, G. S. Sansbury (Duckwings). *hc.* R. J. Symonds; J. Bateman; M. Sandford; G. Garrod.  
**BANTAMS.**—2, M. Leno. 3, R. S. S. Woodgate. *chc.* G. B. Francis; R. H. Ashton; G. F. Ladd. *hc.* J. Watts; T. F. Thirte. G. F. Ladd.  
**ANY OTHER VARIETY.**—1, G. W. Boothby (Gold Poles). 2, A. Silvester (Golden Polish). 3, J. Long (Plymouth Rocks). 4, F. Harding (Malay). *chc.* J. Hinton; R. S. S. Woodgate. *hc.* J. Watts; A. Ward; A. Kitchen; E. J. Reeves; S. P. Broad (2).

**ANY VARIETY.**—Open to Kent only.—1, R. Cheeseman (Dorkings). 2, G. Dowker (Light Brahmas). 3, E. J. W. Stratford (Houdans). *chc.* W. Dring; Col. F. C. Hassard. *hc.* E. Goodwin; S. Jackson; J. Jekins; J. B. Lawler; J. Long. *c.* H. A. Watchurst. *Open to Parishes in Bromley Union only.*—1, Miss E. Long (Various). 2, C. W. Gedney (Light Brahmas). 3, T. Charrington (Dorkings).

**TURKEYS.**—1, F. H. Janson. 2, H. J. Gunnell. 3, T. M. Derry. *chc.* F. Ward (3).

**SELLING CLASS.**—1 and Extra, H. Brown (Spanish). 2, H. A. Watchurst (Cochin). 3, J. Watts. 4, M. Leno (Light Brahmas). *chc.* G. W. Potter; E. J. W. Stratford; J. Webber. *hc.* M. Leno; G. A. Angier; F. Hones; F. E. Arer; E. Rice; H. Thomas; Rev. T. Cochrane. *c.* J. Sleep; H. Mills. *Cock or Drake.*—1, A. Hews. 2, F. James (Spanish). 3, G. Shrimpton (Cochins). 4, F. E. Arer (Rouens). *hc.* Rev. S. N. Heale; A. Kitchen; W. Potter; R. Harvey; J. Chisman; J. Long; Rev. S. W. Stratford; C. H. Webb. *c.* M. Leno (2); J. G. Hepburn. *Pair Hens.*—1, J. Watts. 2, E. J. W. Stratford. 3, Mrs. E. Allsopp (Cochins). 4, E. McMorland (Dark Brahmas). *chc.* E. McMorland. *hc.* H. J. Gunnell; J. Atkinson; G. D. Harrison; T. Goodwin; E. Rice.

**DUCKS.**—*Aylesbury or Rouen.*—1 and Extra, J. Rodwell (Aylesbury). 2, R. Gladstone, jun. (Rouen). 3, N. Edgill (Aylesbury). 4, F. Lake (Aylesbury). *chc.* H. C. Christy. *Any other variety.*—1, W. Boucher (Mandarins). 2 and 3, M. Leno. *chc.* E. Wilson; Rev. W. Sergeantson. *hc.* F. S. Jackson; G. S. Sansbury; C. L. Sutherland.

## PIGEONS.

**POUTERS.**—1 and *chc.* M. H. Gill. 2, Mrs. Ladd. *hc.* M. H. Gill; Mrs. Ladd. *c.* R. Ashton (2).

**CARRIERS.**—Cup, H. M. Maynard. 2, M. H. Gill. *hc.* M. H. Gill; H. M. Maynard. *c.* Col. F. C. Hassard; J. Baker.

**BARBS.**—1 and 2, H. M. Maynard. *hc.* J. Baker. *c.* J. Bailly, jun.

**TUMBLERS.**—1, J. Baker. 2, Mrs. Gill.

**SEVENTEENS.**—1 and 2, H. M. Maynard. *chc.* W. H. Tomlinson. *hc.* Rev. W. Sergeantson. *c.* A. Vander Meersech.

**DRAGONS.**—1, J. Baker. 2, W. Gamon. *hc.* W. H. Mitchell.

**JACOBIANS.**—1, G. Roper. 2, J. Baker. *hc.* A. A. Vander Meersech. *c.* G. Mann.

**ANTWERPS.**—1 and 2, W. Gamon. *hc.* G. Piper.

**TURBITS.**—1, J. Baker. 2, C. A. Crafer. *hc.* G. Roper.

**OWLS.**—Cup and 2, J. Bowes. *chc.* E. W. Van Senden. *hc.* L. Allen; H. W. Webb.

**ANY OTHER VARIETY.**—1, J. Bowes (Archangels). 2, G. Holloway (Pigmies). *chc.* P. R. Spencer. *hc.* A. Silvester; J. Baker. *c.* F. W. Baxter.

**ANTWERPS.**—Four Working.—Cup, Sparrow & Cotton. 2, C. L. Sutherland. 3, J. Haydon. *chc.* W. Kennedy. *hc.* A. Bentley; E. F. Wilson. *c.* Lady Lubbock.

**SELLING CLASS.**—Single Bird.—1, A. Bentley. 2, A. A. Vander Meersech. *chc.* W. H. A. Miller. *hc.* M. H. Gill; H. Thurlow. *c.* W. G. Tancock; Mrs. S. Ladd. *Pair.*—1, W. G. Tancock (Carriers). 2, E. Stocker (Carriers). *chc.* Col. F. C. Hassard. *hc.* J. Bowes. *c.* J. Bailly, jun.

**JUDGES.**—*Poultry:* Mr. Teebay. *Pigeons:* Mr. Allsopp, of Birmingham. *Canaries:* Mr. Willmore.

## NETTLES FOR TURKEYS—EGG-PRODUCERS.

In mentioning "nettle tops" for young Turkeys, &c., is the stinging nettle only meant, or the different Labiates known by so many people as "dumb nettles?" [Only the stinging nettle. —EDS.]

I see by your answer to "C. L. M." in to-day's issue, you think him fortunate in having six eggs a-day from forty-five hens. I have the same number from ten hens of the Pheasant Cochins breed. I have had since January 1st till to-day inclusive (January 15th) eighty-four eggs. The first three days of the year there were three or four a-day, then increasing—twice seven eggs, twice eight in the day.—M. A. WEBB.

## POUTERS, ANY OTHER COLOUR OR MARKING CLASS.

I AM glad to see Mr. Huie and "Go-AHEAD" supporting this indispensable class; without it all the standard colours would dwindle to nothing. They are, as a rule, the most perfectly shaped and, when Meales or Chequers, the most beautifully-marked birds one sees. I have just returned from Aberdeen Show, which, as far as Pouters were concerned, was the Show of the year. In the prize list there were classes for Any other colour, and I may say they contained some of the best birds in the Show. The first-prize cock, a Mealy, was splendidly marked. This bird once belonged to Mr. Volekman, and with a mealy and a splash hen he had bred some of his finest Blues, amongst them the cup bird at the Crystal Palace Show of 1872. I am not aware whether Mr. Volekman remains in the fancy, but it is well known that he was anything but an advocate for the use of off-colours; yet for years, while writing to this effect, he still continued to breed and show these birds. From this and other instances I could name, it will be seen that those who most despised this class were unable to do without it. Therefore I trust committees of shows and fanciers in general will not follow "WILTSHIRE RECTOR'S" example in attempting to kick down the ladder by which he, or perhaps it would be truer to say others, have risen.—J. E. SPENCE.

**NORTHAMPTON SHOW.**—Liberal prizes are offered for poultry, Pigeons, Rabbits, and Cats, besides twenty silver cups. The

only mistake we note are the two Dorking classes, in which Dark, Grey, and White are made to compete. No judge ought to be asked to decide upon the comparative merits of such an unfair mixture. There were 1400 entries last year, and probably there will be more this, for the management has always been very good.

### RABBIT PRIZES AT NORTHAMPTON SHOW.

In answer to "R." in your Journal of the 15th inst., I am requested to state that the cause of the schedule for Rabbits not being quite so liberal as last year is precisely that hinted at by your correspondent in the fourth paragraph of his letter. Last year a number of fanciers and several of the Committee subscribed specially for the cups, but a defaulter in one of the classes was a loss to the Committee of three guineas. This year we have but one cup promised, and but one subscription; and it was decided that this should go to the Angora class. A number of fanciers may say they would have been pleased to subscribe; but I have always found when recourse has been had to an appeal of this sort, that the proffered support has been so hampered with restrictions as to make it impossible for the Committee to avail themselves of it. But if your readers are inclined to give the Committee any special sum as a prize for any particular class without any other restriction than that the sum shall go as an extra prize, I shall be most happy to correspond with them.

As regards the class for the "Heaviest," it has been a loss; and the Committee considered it best to reserve the money as extra prizes, should any of the other classes display unusual merit.—WILLIAM HUMPHREYS, *Secretary*.

### THE NATIONAL PERISTERONIC SOCIETY'S SHOW.

This was on the 13th inst., being for the fifth time held at the Crystal Palace. It fully sustained the high repute of this Society. We hope fanciers will witness such exhibitions heralding in "many new years" to come, inasmuch as they present peculiar characteristics, standing alone, or nearly so, as non-competitive gatherings. The conditions of a non-competitive show necessarily bring together some selected specimens of the loft, whilst in this amateur exhibition the different varieties of Pigeons massed together are to the public, and especially to the young fancier, a good practical lesson on the materials that constitute practically a breeding stud of Pigeons.

Mr. Esquilant's contribution of twenty Blue and Powder Blue Owls, a strain he has possessed for many years, greatly pleased the cognoscenti. Opposite to it stood another most interesting pen of Owls, Yellow, and of the old English type. We may at last look forward to the resuscitation of this choice variety, and thank Mr. Whitehead for his efforts.

Mr. South contributed Dragons, Blue, Silver, Yellow, and Red, also Turbits, Jacks, and Baldheads. We praise Blues and Silvers, yet keep a little extra admiration for Yellows. A just critic would, on viewing Mr. South's pen of Yellow Dragons, so level in quality and up to the standard for colour, declare the fancy justified in selecting the soft richness of the yellow tint as the *richeste* colour of the Pigeon. Mr. Stevenson, of Tooting, a recently-elected member, sent his first contribution, a good pen of Yellow Turbits. Mr. Bull's Jacobins, good in colour, were not lacking in quality.

English Pouters found but one exhibitor—Mr. Esquilant. It appeared that the Pouter, like the prophet, is not esteemed in his own country, for we observed no less than three foreign varieties of this bird sent by Mr. Vander Meersch. The same gentleman also penned a good collection of Fantails, which variety was also contributed by Mr. Esquilant.

The critical Short-face fanciers who visited the Palace were not disappointed. They lingered long before the pens of Messrs. Esden, Ford, Merck, and Heritage, for there stood before them the twenty Black Mottles of Mr. Esden, all of the highest quality, side by side with his beautiful Black, Yellow, and Red Beards. Then followed Mr. Ford's Almonds, forming of themselves a sight worthy of a visit to Sydenham; then Mr. Merck's two pens of old and young birds, a splendid collection; then Mr. Heritage's, though last not least, a pen of birds as near the standard for head and beak as they can be bred. It speaks well for the fancy that a bird requiring for its production so much patient and scientific care should be so numerous and so beautiful as all the old fanciers were delighted to affirm. Some good Baldheads were shown by Mr. Newman; Jacobins and Turbits of a high class by Mr. Easten, of Hull.

Mr. Jones had pens of Owls, English and Foreign, also some choice Turbits. Mr. Tegetmeier sent a dozen Blue Dragons, and a pen of the now fashionable Homing Flyers. The fine condition and super-excellent quality of his Dragons could not fail to arrest the observation of a fancier. Mr. Hedley's Barbs contained many of the known specimens in the fancy, and some

young birds worthy of their parents. Mr. Gill also exhibited a pen of very good Barbs.

The Toy varieties were not forgotten. Four were supplied by Mr. Vander Meersch; Black Fantails by Mr. Whitehead; Archangels by Mr. Jones; Messrs. Huggins, and the Honorary Secretary, Mr. S. C. Betty, also added their quota of Yellow and Red Dragons.

At all previous shows organised by the National Peristeronic Society Carriers have been in force. In fact they have, on all these occasions, formed the *pièce de résistance*, which no fancier, however keen his appetite, has pronounced stunted or deteriorated. The list of the Carrier exhibitors comprised the names of Col. Hassard, Messrs. Square, Heritage, Ord, Hedley, Crisp, Feltham, and Baunton Ford. That the Carrier is the perfect type of Pigeon beauty was unmistakably apparent in some birds, principally young ones, shown by Col. Hassard, Messrs. Square, Heritage, and Hedley. One young Black cock, the property of Mr. Square, is not far from being the best bird of his season. Col. Hassard's collection comprised Blacks, Duns, Blues, and Silvers, just the type of bird we recollect he possessed some twelve years ago, and which the fancy gladly welcome again. Mr. Heritage's row of twelve Carriers, exhibited singly, would, unsupported, have rendered the Carrier contingent complete. Exhibited together with the high-class birds of Messrs. Hedley, Baunton Ford, Ord, and Crisp, the Carrier element crowned the success of the Show.

### ABERDEEN POULTRY AND PIGEON SHOW.

(Concluded from page 67.)

THERE were eighteen entries in the class for young Blue cocks bred in 1873. Not only was this the largest class, but it contained some birds of very fine quality. No. 349 (J. C. Lyell), was a bird of perfect marking and large crop, but with too heavy limbs. No. 351 (T. Rule), also well marked, but faulty in style of limb. No. 353 (J. C. Lyell), first prize; some discussion was created as to whether he was entitled to his position, but he was without doubt a good bird and perfect in marking, with finely-covered legs and toes. Being only a late August bird he bids fair to turn out fine. No. 357 (R. Fulton), was highly commended, and a good-looking cock all over. No. 360 (G. Ure), commended, wanted pinion and had an imperfectly-cut moon, but in style he left little to be desired. No. 361 (A. Frame), wanted bib and pinion to set-off an otherwise handsome young cock. No. 362 (J. Mitchell), was looked upon as very matured for a young one. Nos. 363, 364, third-prize, 365, and 366, second-prize, were all Mr. G. Ure's, and all fine. No. 363 might have changed places with one of the prize birds, being well marked and extremely handsome.

Young Black cocks were seven entries, and the first was No. 367 (D. Stewart), highly commended, finely marked, and thin in girth. He seemed rather ill on the last day of the Show. No. 368, second prize, was a great bird to be only five months old, his catalogue age. Some doubts were expressed as to his being a bird of 1873, but we heard his owner (Mr. G. Schaschke) give the date of his hatching—viz., the 14th June—from which we calculate that he ought to have been entered as seven months old. No. 370 (J. Grant), third prize, was a thick bird, not well marked, and too rough in his leg-feathering. No. 371 (F. McCrae), was small but neat and evenly marked, though dull in colour. No. 372 (G. Ure), the first-prize bird and also winner of the medal for young cocks, was a grand, upstanding, slender, and long-limbed bird, but scarcely correct in marking. No. 373 (J. Mitchell), commended, was a good style of bird, well marked and long, not exactly right in shape of limb.

Young Red cocks. We would designate this class, which contained eight pens, as the worst as regards Pouter qualities in the Show. No. 376 (J. Wright), was no doubt the best among them as to length and shape, but almost solid-breasted, without pinion, and of only fair colour. None of the others warrant a minute description.

Of the five young Yellow cocks the three shown by Mr. Ure were first, second, and third, but none of the five was perfect in colour. In other respects, however, No. 385, the first-prize bird, was good, being a fine, upstanding, and particularly stylish cock. Had he been of a richer colour he might have been entitled to the silver cup for the best young cock in the Show. We have no doubt he will be heard of again.

Young White cocks brought out seven, and No. 387 (McGill Skinner), first prize, was not worthy of his place; we think either No. 388 (R. Fulton), second prize, or No. 392 (J. White), third prize, were in our opinion the best, but the latter had the fault of being slightly hog-backed, though otherwise a raking young cock. The quality on the whole in this class was good.

Blue Pouter hens of any age brought out ten entries, and the first on the list, No. 391 (D. Stewart), although unnoticed, was worthy of a prize, and certainly one of the best four in the lot being particularly handsome, thin in girth, and well marked. No. 395 (J. C. Lyell), commended, was also a fine hen with a capital bib and moon. No. 397 (A. H. Stewart), third prize, was

very dirty, but that could not conceal her fine points. She is such another as No. 394. No. 398 (G. Ure), highly commended, might have been more honoured and there would have been no complaints. Her crop was large for a hen and finely marked, with great length of feather and thin waist; the only fault she showed was front thighs. No. 399 (R. Fulton), second prize. Looked at in front this hen was too heavy and wide, and, in our opinion, although a good bird not in the same list as either 397 or 398. No. 400 (G. Ure), first prize, was a grand hen in every respect, except a little too white on the crop. In shape and general appearance she was certainly the best in the class. This class was a very fine one on the whole.

Black hens, any age, were eleven pens. No. 405 (T. Rule), second prize, was a well-marked and glossy-coloured bird. No. 408 (A. H. Stewart), was unnoticed but worthy of a prize. We are quite surprised at the Judges overlooking her entirely; a bigger and handsomer hen could scarcely be, but she looked as if she had been kept in a coal cellar. Her almost only fault was being rather smoky in colour, but this should not have condemned her, being otherwise so good. She is one of Mr. Ure's breeding. No. 409 (F. McCrae), was commended, a heavy bird but well marked. No. 411 (G. Ure), first prize, a particularly handsome raven black hen, about perfect in marking, worthy of her position. No. 414 (G. Ure), third prize, also good in colour and marking.

Eight old Red hens came next, and the first of them, No. 415, J. C. Lyell, highly commended, was a very long fair-coloured hen of correct marking. No. 416 (W. Ridley), first prize and cup. We recognised this one as first at Glasgow for the last two years. She is fair-coloured, very long in feather and limb, well marked, but does not show much crop, in the pen at least. No. 418 (R. Fulton), commended, was also mentioned at the late Glasgow Show. She is a bird of better colour than the two preceding ones, but much smaller, although a tidy, nicely-shaped hen. No. 419 (J. C. Lyell), was the best shaped hen of the lot, but failed in colour and marking, being too gay. The length, shape, and feathering of her legs were not to be beaten by any hen in the Show. No. 421 (A. Frame), third prize, was a good coloured and well-shaped but rough-legged bird. No. 422 (John M. D. Brown), second prize, was an utter mistake, being only good in colour and marking on the crop. In other respects she was certainly the worst hen in the class.

Old Yellow hens were eight pens. No. 424 (A. H. Stewart), third prize, was of a faint colour but a long thin bird and fairly marked. No. 426 (R. Fulton), first prize. It was curious to observe how the Judges stickled for colour in one class, as in the second-prize Red hen, while in the next they awarded first prize to the worst-coloured Yellow in the class, a bird of a pale straw colour and chequered. She was a bird of good marking and style of legs, but drooped her shoulders too much. No. 427 (J. White), was very good in colour and marking, and was highly commended. She looked short-legged, however. We should have preferred No. 428 (G. Ure), the second-prize bird to the first, as she was of better colour and equally good in other respects. No. 429 (G. Ure), commended, was capital in style and rich in colour, but not so correctly marked.

The prizes for old White hens (eight entries) seemed to give satisfaction, and were gained as follows:—No. 430 (W. Ridley), first prize, a fine hen but she has seen better days. She is getting heavy in appearance. No. 436 (R. Fulton), second prize, a handsome thin-girthed bird, and No. 439 (W. Stiles) third prize.

Seven hens of Any other colour came next, and comprised No. 440 (J. C. Lyell), commended, a long stylish Blue-chequer. No. 441 (W. Hendry), highly commended, a White with a blue tail, which ought to have had a third prize instead of No. 443 (J. E. Spence), also a White with blue tail and hog-backed. No. 444 (G. Ure), third prize, a beautiful stylish sandy. No. 417 (J. Mitchell), first prize, a very fine Mealy, rightly placed at the top of the list.

The classes for young hen Pouters, birds bred in 1873, were all well filled and contained many first-rate in quality. The Blues were fourteen pens, the first prize going to No. 450 (G. Wallace), the winner also at Glasgow. She may be described as perfect in style, and the only fault she has is being slightly deficient in bib. Her breeder deserves credit for turning out such a beautiful bird. A. H. Stewart's highly commended pen, No. 451, was very handsome but not perfect in marking, wanting pinion on one wing and a better-cut moon. No. 453 (G. Ure), was unnoticed, but of a grand shape. In marking she showed a good moon but had slightly rough and foul limbs. No. 455 (G. Ure), second prize, was a very similar bird to the first-prize winner, but not so nicely marked, having one side with too much white. There were other very good hens in this class, as No. 448 (McGill Skinner), third prize, 452 (F. McCrae), of a fine style, and 456 (A. Frame).

There were nine young Black hens, and Mr. Ure took all three prizes. Between the first and second-prize birds there was little to choose, both were good in colour, marking, and shape, and both finely-cropped birds. The third-prize one was, perhaps,

a more stylish bird than either, but did not show nearly so well. Mr. Fulton's bird (No. 464), was of a good colour and nicely marked on the crop, but without pinions. She has fine long thighs and well-shaped and feathered legs.

Young Red hens (eight entries) were better than the young Red cocks. No. 470 (J. C. Lyell), the best-coloured one in the class, was perfectly marked with clean stocking legs. She is within very little of the correct colour. No. 475 (R. Fulton), third prize, well marked, fair colour, and very showy, but imperfect in shape of limbs and wanting in long toe feathers. No. 476 (J. S. & H. Robb), first prize, was the biggest one in the class, but not fine in colour, though fairly marked.

Young Yellow hens (six entries) contained some very good birds. No. 478 (J. Grant), a long good-coloured bird, which we preferred to No. 479 (W. Thomson), the third prize bird, short in feather and too rough-legged. No. 480 (G. Ure), was first prize and winner of the cup for young hens. She is a good-coloured bird of good proportions, well marked except that she wanted pinions on her wings. No. 482 (G. Ure), second prize, was finely shaped but faint in colour and too gay on crop.

The ten young White hens contained some fair birds, and the first and third prizes went to J. Grant, Edinburgh, the second to G. Schaschke, Aberdeen.

There is no doubt there is an immense improvement in Pouters during the last few years. Anyone who remembers the first Glasgow Shows, about fourteen years ago, cannot fail to be struck with the altered style of the birds. The finely girthed and stocking-legged Pouters of the present day compare favourably with the rough-legged runty style so much in vogue before. In marking also there is a great change, and fine bibs, moons, and pinions are more the rule than the exception. Foul thighs are still rather prevalent and difficult to breed out. Gay birds are generally clean-legged, but when otherwise perfect in marks Pouters generally retain some foul feathers about the limbs. It seems the acknowledged practice, however, and to be tacitly understood, that these as well as snips on the forehead may be extracted as far as practicable, and if the Judges were to disqualify birds that had been so operated on they would have enough to do, for it was palpably plain that some dozens of them had been more or less plucked. The same may be said of the late Glasgow Show. It is well known that dressing goes on, and the Judges must just pretend not to see bare places at the roots of beaks, &c.—[We totally dissent from this opinion.—Eds.] We wish all success to the Northern Poultry and Pigeon Club of Aberdeen. Its Show has suddenly sprung up from the position of second class to the very front rank, a position which we hope it will long retain.

We are indebted to a correspondent for the following account of the rest of the Pigeons.

In old *Carrier* cocks the prize birds were all excellent Blacks. Old *Carrier* hens were a small class but first-rate in quality. The first-prize winner, a magnificent hen, well deserved the cup she took as the best *Carrier* in the Show; the second-prize one was fit to be first in many competitions. Young *Carriers* were very good, the first and second splendid birds, showing quality all over.

Short-faced *Tumblers* were a very fine class, first going to an Almond cock, grand in colour and head; second, also an Almond, good in head but not so rich in feather; third a good Yellow.

*Earbs* were not numerous but of good quality. First an exceedingly fine Black, which took the cup for the best Barb or Short-faced Tumbler. Second, third, and highly commended fair birds.

In *Fantails* all the prizes went to real Scotch birds with a good tail and a small body, characteristic of those birds. Being always in motion they completely put the large coarse English birds into the shade, the latter always standing in the pen like stuffed birds, devoid of nervous action. First, second, and third were all good birds of the real Dundee breed. Pen 545, the Crystal Palace winner, did not draw the Judges' attention, being out of condition, apparently from over-showing.

In *Jacobins* the first prize went to a Red hen, good in colour, hood, and chain, but yellow-eyed. As this class, however, was judged by gas-light the Judges cannot be held responsible for not noticing it; we prefer, on the whole, the second bird, as being rather longer in feather and better in head. Third, a Yellow, a fair bird. The class was large and on the whole good.

*Trumpeters* comprised a number of excellent birds, there being little to choose between the prize-winners, which were all of the new type.

English *Owls* were numerous and good. The first and second seemed to us, however, to have a strong cross of the Foreign; and as there is only one standard for both varieties, and fauciers will cross them, it seems useless to divide them. No. 591 (J. Chadwick), was the best of the lot, but came too late for judging. In Foreign *Owls* a splendid White, good in all points, was first; second a good Blue; third a White.

*Turbits* were a large class but contained nothing very striking. First a fair Yellow; second same colour, well frilled but deficient in peak.

Nuns were not numerous, but the first and second were very good.

*Dragoons* are birds we do not care much for in Scotland, and consequently cannot know much about, but according to our light the first-prize bird well deserved its place; there was little choice between the second and third prizetakers.

*Antwerps* were the smallest class in the Show, three entries; and next year we hope there will be no class for them, as they are quite out of place in a show pen.

In Common *Tumblers* a pair of nice Black Mottles were first, Whites second.

Any other variety was not a large class. First, Lace Fantails; second, Magpies; third, Archangels.

The Selling class contained no fewer than thirty-eight entries, and comprised some very good Pouters. The first prize, No. 665 (T. Rule), went to a perfect gem of a Jacobin, quickly claimed at £1 15s. Second a Mealy Pouter, and third a pair of grand-coloured Red Magpies.

## HONEY AND BEES AT SHOWS.

A snow—what is its nature, and what its effect? Is it an exhibition of ordinary or extraordinary things? Could the cattle, the poultry, the Pigeons, the Rabbits, the song birds, the fruits, the vegetables, and the flowers, &c., be produced and presented in such fine form and perfection at various shows, as is the custom, by ordinary means? I think not; and it is the fact that they are not, nor are they expected to be. Why, then, should a bee show have restrictions that are not applied to any other kind of shows? To sell sugar syrup for honey, or foreign honey as the pure nectar of English flowers, is right down dishonest, and deserves visiting with as severe punishment as any other fraud. Dishonesty of this kind, to some extent, carries its own corrective, for few will face the dog a second time which has bitten them; so, few will purchase a spurious article from the party who has cheated them once. But to ascertain and to exhibit what our little favourites can do under the most favourable circumstances and assisted by artificial treatment need cause no one pain. Have shows a demoralising tendency? I think not; for it is perfectly understood that every method that art can suggest is resorted to to accomplish the desired result. It would never do for the agricultural societies to establish a rule that stock for exhibition should be simply turned into a pasture field, the ordinary mode of producing beef, because they would find their exhibitions, like the honey supers mentioned by "A SOUTH LANCASHIRE BEE-KEEPER," at the Burton-on-Trent Show, not half what they ought to be; and if they did, some one would begin to squabble about the particular herbage of the field. So that I think for exhibitions there is nothing like a fair field and no favour, and the fewer restrictions the better, for you have only to say to human nature, "You must not," to awaken and stimulate the spirit of evasion. Of course, if there are to be restrictions, let them be properly defined and by all means honestly carried out; but I think the restrictions suggested by some of your valuable contributors would tend to give the prizes to situation, and not to the abilities and intelligence of the exhibitors.

I cannot think that any bee-keeper would leave the Manchester Exhibition with false impressions, for he would know that such supers could have been obtained in 1873 without artificial treatment. I am afraid that more false impressions are made by parties recommending this and the other fine hive, and this and the other grand system for obtaining honey, whereas the description of hive is only a secondary matter, if it only is sufficiently large for breeding purposes and for storing honey. The main desiderata are good pasture, fine seasons, and strong colonies; for without these, no matter what system is pursued or what kind of hive is adopted, the result will be very poor indeed.

The nature of shows is extraordinary, and necessitates extraordinary treatment, and their effect is to stimulate the exhibitors to fresh exertions, and I hope we shall have many more of them.

—THOMAS BAGSHAW, *Longnor, near Burton.*

## HONEY AND HONEY EXHIBITIONS.

I HAD hoped that the question of "What is honey?" would not again be discussed in "our Journal" till the simple experiments suggested by me would be tried by "B. & W." and others, who fancy that crude honey, or honey as it is found in flowers, becomes perfect by evaporation. I am quite certain that if the question be fairly and fully tested by experiment, my statements will be amply confirmed. In addition to the experiments suggested, I may mention another, which goes a long way to prove that honey as found in flowers undergoes a great change in the hive. Let bees returning from the fields with their bags well filled be caught and dissected, and let an equal number be fed from a honeycomb and dissected. The honey in the former will be found to be crude and imperfect—a mere sweet juice, lacking the smack and pungency of real honey. If any of our friends object to take the lives of bees with a view to settle so unim-

portant a question, let me ask them to catch the bees containing the honey (for examination) by the wings, and tickle or touch the under side of their abdomen with a straw or small twig, and they will thus cause the bees to deposit the contents of their bags on the straws or twigs. Let the bees be afterwards set at liberty, and the deposited honey examined and tasted.

Another valued correspondent—viz., "A RENFREWSHIRE BEE KEEPER," has appeared with a new theory as to how honey is consolidated in hives. He asks, "May it not be that our favourites at this particular stage possess the power, before hermetically sealing up, to suck out and extract the aqueous and aerial properties, causing it ever afterwards to consolidate and keep?" If we were disposed to examine and compare theories, and award prizes for best and second best on this subject, our Renfrewshire friend, so high in other matters, would not be at the top of the list. At the commencement of his letter he says, "Mr. Pettigrew is perfectly correct in treating, for all practical purposes, sealed honey as a distinct article from unsealed." I am very sorry he has misunderstood my meaning or unwittingly misrepresented it in this matter, for I have never treated honey sealed as different from honey unsealed, or made a distinction between them. Much that I say about bees is quoted from these pages and re-appears in country newspapers, and hence, while courting honest criticism, I am very anxious to be fairly represented by those who disagree with my opinions. I hold that honey proper is produced from the sweet juice found in flowers, and is converted from this sweet juice or crude honey into perfect honey by being re-swallowed and disgorged a second time by bees. Whether found in cells with or without lids it is perfect honey. I respectfully request those who think differently to put the matter to the test.

Now for a word about honey exhibitions. If rules could be framed to operate for the benefit of exhibitors and exhibitions I should be gratified. At all events, they could be tried. Mr. Yates and I wrote the schedule of prizes for bees and honey at the Manchester Show. Mr. Yates gave £5 of the £25 offered, the rest being collected by myself. We were anxious to make the Show a success as well as an example. The Curator lately told me that bees and honey would be a feature in all future autumn exhibitions at the Manchester Botanical Gardens. Why should not the Crystal Palace introduce "hives and honey" at its next September show? It would be a new and attractive element at their annual fête. Good prizes will secure great competition. In the case of the Crystal Palace, in which bees in glass houses may be seen always, it will not be necessary to offer prizes for bees and glass hives, but simply for supers and hives of honey. This suggestion is thrown out for others to take up and carry into execution.

Those who attempt to frame rules and limits for apirians should remember two things—viz., the uncertainty of our seasons and the desirability of having something strikingly grand for visitors to look at. Who cares to see what is not uncommon? And who cares to exhibit what is not worth notice? Prizes are offered for things that command the admiration of visitors. A hard-and-fast line, forbidding artificial treatment in the case of bees, would probably cause every second exhibition of honey to be a complete failure. I speak now in the interests of societies offering prizes and of bee-keeping generally, for it is not my intention ever to compete for prizes, though I have used many incentives for others to do so. If we visit an agricultural exhibition we find the prodigious products of artificial treatment—cattle of immense weight and size, each of which when young consumed the milk of four cows. If artificial treatment is permitted amongst cattle, &c., it should be doubly so amongst bees which are dependant on sunshine. Apart from all considerations of prize-taking, I hold a few pounds of sugar given to a swarm lately hived to be in accordance with the management of all able apirians, and of immense advantage to the swarm.—A. PETTIGREW.

## OUR LETTER BOX.

TREDEGAR POULTRY SHOW (*W. L.*).—We are surprised that you have received no answer respecting the money for the birds sold. Write again to the Secretary.

DEVIZES POULTRY SHOW (*Idem*).—The card in the first instance was probably misplaced. You can have no remedy under any circumstances.

POULTRY DIARY (*H. E. R.*).—We published one some years since, but it did not sell, and we know of none now. There is an American periodical so called.

HENS FOR BREEDING (*Glaucus*).—They are not good hens to breed from, being too mossy and indistinct in the markings; at the same time many worse are bred from, and much worse take prizes at some shows. When we say they are not good to breed from, we mean if you want perfect birds; but to produce good stock you may use them.

MARKET FOR TURKEYS (*A. C.*).—As a rule, Turkeys sell better at home—i.e., in the nearest market town, than in London. Much expense in the way of carriage and commission is saved. You should make 1s. per lb. of them all, and those weighing 20 lbs. should make more. If they will not make this price, you must have them fatted, killed, and picked clean, and sent to London. We repeat, as a rule they sell better at home.

BRAMA USELESS—HOUDANS (*J. K. L.*).—The Brama is a failure, and you will do well to kill him. The description is anything but that of a stock bird.

Hondans are good hardy birds and non-sitters. Their eggs should be set in March.

**DORKINGS—CROWING HENS (Spanish Cock).**—Your experience of the Dorking hen may and will be endorsed by thousands. There is no better breed for general purposes. A crowing hen is the gallinaceous representative of "woman's rights," and is a nuisance. She will never lay, and will torment those that do. Kill her.

**RATES OF LAYING (H. G.).**—No bird lays every day without intermission, nor can any average be arrived at. Much depends on health, weather, food, and season. Thirty-three eggs are quite a full average result in twelve days from four or five hens. The number will increase in a fortnight.

**TWISTED FLIGHT-FEATHERS—DUCK MANAGEMENT (L. A. B.).**—A twisted flight in a Goose is a disqualification, and to any other bird. Oats are the best food for Geese and Ducks. Ducks should begin to lay at between eight and nine months old. The best way to keep tame Wild Ducks tame is to pluck them, to cut-off not only the feathers, but the wing itself. If this is not done, and they are kept on a large piece of water, they are apt to be decoyed away by Wild Ducks in the water either flying over or settling on the water with them.

**JACOBIN PIGEONS (Idem).**—Jacobins should be small, and must be pearl-eyed. A pearl eye has a white iris. Do you mean there is no outlet for the Pigeons, but they are confined to 6-feet square? In that case, if you put up plenty of boxes, you may keep six pairs.

**BRAHMA DYING (Tyro).**—From your description the bird died from disease of the liver, caused by great variation of temperature and insufficient feeding. Your food is good enough, but where you have to counteract unfavourable weather you must feed early and late. They should have meal at seven in the morning and at half-past four in the afternoon, with a feed of maize and house scraps at mid-day. Our experience of Brahmas and Cochins is, that they are worn-out at three years and a half old. We never use them after two.

**ROVEN DUCKS (Idem).**—Being only 5 or 6 lbs. in weight they are not heavy enough, but as they bear age better than the fowls you may look to their getting heavier as they get older. You may mate the drake you mention with the five-year-old Duck and two of the largest and best of your young ones.

**TWISTED BILL (Duckwing).**—There is no remedy, and you will do well to kill him.

**BLACK SILKIES (E. J. N. H.).**—We can hardly alter our previous opinion, but will continue to make every inquiry. We have never seen Black Silkies, but have no doubt they may be made, or may come through accident. The first Black Cochins were the result of a cross between a Buff cock and a White hen. In our own experience one particular walk produced two-thirds of Emu Cochins, although the parents were unmistakable Buffs, and carefully selected to breed good birds. We think the experiment worth trying, but you must be prepared for one result which seems to show itself already. In these accidental breeds, where black birds are the result, it is almost impossible to get perfectly black cocks. Coloured feathers will show themselves in the hackle and saddle, especially after the first moult.

**MIXING VARIETIES (A Subscriber).**—We are not favourable to a moderate run of poultry made-up of several breeds. A well-managed but limited run should consist of one breed only, and that breed should possess all the necessary properties for the perpetuation of its breed. Of those you have named we prefer the Brahmas. They bear confinement, they are very hardy, they are good layers and sitters, and the young are easily reared. Hondans and Crève-Cœurs are both hardy and good layers, especially the latter, but they do not sit. This involves buying broody hens when you wish to rear chickens. We do not think either of them possesses any advantage of any kind to compensate for this inconvenience. You might have saved the concrete floor to your house. As you have it we advise you to cover it 2 inches thick in gravel or road grit, or, failing those, with good dry earth; a floor that keeps the feet always on the stretch, and that admits of no scratch is not favourable for fowls. The run you name will answer for sixteen hens and two cocks. Pains-taking may keep more. Having a large kitchen garden you may give them lettuce, and barrowloads of weeds or rubbish that are dug-up, clearings of paths, stumps of cabbage, &c.; but all these things must be thrown in a heap, and the fowls will scatter them, affording food and amusement. As soon as they have divested them of the edible parts the bare stumps should be raked-up and taken away. If no part of the run is laid-down in grass you should cut large sods, with plenty of earth to them, and throw them in; the fowls will eat the whole of it. Avoid all artificial heat; healthy well-fed fowls do not want it, nor does it help them. If anyone would heat gratuitously every house we have we would not accept the offer. Bricklayers' rubbish is excellent for fowls, especially during the laying season, but broken earthenware is quite useless. Your laying is very good and above the average.

**FOWLS FOR LIMITED RUN (A. C.).**—We call yours a small space. You may run a cock and six or eight hens in it, and some of the previous answer may interest you. To be a pleasure and a profit, where there is a family you should have both eggs and chickens. The breeds you name are non-sitters, with the exception of the Brahmas. We can find no birds more profitable than they are. Let experience speak. They are of comparatively recent introduction, and yet they form one of the largest, and in some instances the largest, class at exhibitions. Their eggs are an average size, and if they are killed young they are good for the table. No bird is good for the table after it is old; and for eating purposes it is old at seven months old. The very dark eggs would be from Cochins or Brahmas. They lay all colours—from a light mahogany to a French white. If you decide against Brahmas, and choose among the non-sitters, those that will do best with you will be Spanish, Hondans, or Crève-Cœurs. Your house will do. Raise the floor of it above the run, let the bottom be of earth, and the floor in one corner—not in the middle.

**POULTRY EXPERIENCE (\*).**—We are always glad to hear of your experiences. The plan you have adopted is the profitable one. Keep a few of your best hens two seasons, but let the remainder of your stock be pullets. Moulting becomes more difficult to a hen every succeeding year. The reparative process becomes slower and more difficult. They also lay fewer eggs. Send them to Stevens sale, the nearest market, or into the kitchen. The only code of a profitable poultry yard should be a Draconian one, or transportation should be a regular annual process.

**POWELL'S LEG DISLOCATED (Sam).**—From your description the bird will never be a prize one again. A leg broken, when the fracture is visible, can be set and cured without much detriment, but if the injury be above the knee there is little hope. A bird hatched November, 1873, cannot be shown as a chicken of 1874 at any period of the latter year.

**COCKS FOR EXHIBITION (German).**—Put a pullet with each cock. It will save their losing much flesh and weight. The hens from which you intend to breed should now be running with cocks. Good cooling food is the best for moulting

fowls. Everything heating should be avoided. Mix their ground oats with milk. Give barley meal, and change with whole maize and barley. We have never found fowls do well on maize meal, and they would not eat it, unless they were starved to it. Lettuce is good food in moulting time.

**ALTERING COMBS (J. M.).**—We have never succeeded in getting pea-combs from single ones, either in Brahmas, Hamburgs, or Sebrights. Faults are more surely transmitted than virtues. We would not on any account breed from a vulture-hooked bird. (C. S.).—If the comb be a good pea-comb it is not a disqualification—it is a disadvantage. We should not hesitate to breed from him.

**ULCERS INTERNAL (New Subscriber).**—The disease you complain of is partly caused by great variations of temperature, and partly by insufficient or injudicious feeding. Avoid all but natural foods. Give ground oats, barley meal, a little whole barley and maize, with kitchen or house scraps, and you will have no disease. We have no faith in prepared food, or in substitutes for that which is sufficient for a wild bird.

**PERFORATED ZINC (C. H. E.).**—No. 12½ we should think the best size. Try it.

**BEE FLOWERS (J. A. H. S.).**—The Sunflower and Buddlea glohosa afford pasturage for bees, especially the Buddlea. We do not remember a flower, except some of the Arums, to which bees will not resort.

**BOOKS (Cultur).**—It is the fourth Georgic of Virgil that details the Roman knowledge of bees and their management. There is a translation by R. M. Millington, published by Messrs. Longman, that would suit your purpose; for though in verse the translation is very close to the original Latin.

**MARINE AQUARIUM TUBING (Glaciers).**—Indiarubber tubing is the handiest, and not affected by or affecting the water. Throw the coffee grounds on to the dung-hill.

#### REMARKS.

- 14th.—Dark morning, and rather dull all day, though no rain.  
 15th.—Dull all day, with frequent slight showers.  
 16th.—Dull and showery all day, and wet night.  
 17th.—Rather fine morning, gradually becoming more so; beautifully fine about noon, and particularly bright and pleasant all day.  
 18th.—Frost in the night; rain at 8 A.M., and more or less wet all day, but very much warmer.  
 19th.—Rainy and dark at 9 A.M., and occasionally so all day; about as unpleasant as it could be.  
 20th.—Sunshine and showers all day, but the rain prevailing at night and with rather a high wind.

A week of higher temperature, but of dark, damp, comfortless weather, except on Friday, which was very bright and enjoyable. The maximum temperature in the shade on the 20th was higher than has occurred here in January since 1829. January 31st in that year had a maximum temperature of 55.3.—G. J. SYMONS.

#### COVENT GARDEN MARKET.—JANUARY 21.

The markets generally are very slack and dull, the supplies being ample. Grapes and Pines are especially plentiful, the latter making very poor prices, owing to the inferior quality of the greater portion of the English-grown fruit now coming to market. Dealers are glad to clear out, even at less than 3s. per pound. A large bulk of Apples is still coming, but Pears of good varieties are comparatively scarce.

From observations taken near London during forty-three years, the average day temperature of the week is 44.9°; and its night temperature 31.6°. The greatest heat was 57°, on the 29th, 1863, and 3rd, 1850; and the lowest cold 8°, on the 31st, 1857. The greatest fall of rain was 0.52 inch.

## HEATING—FUEL.—No. 3.

HAVING in a previous paper treated of the different kinds of fuel which may be employed for heating hothouses, I shall proceed in this to consider the extraction from the fuel of the utmost amount of its heat. To effect this we need a furnace, and wishing to convey the heat to the place where it is to be radiated, we need a boiler, and from it pipes to convey the heated water to the structure to be warmed, also pipes to

return the water to the boiler. We likewise require a flue to carry-off the smoke and other obnoxious products of combustion. Heating by flues or pipes—viz., by hot air, I do not propose to deal with; for though familiar with that mode of heating from disastrous experience, I have for some years let all my ideas run in the channel of heating by hot water, and to treat of hot air or flue heating would be to take a retrograde step, which is foreign to my intention.

Now upon the furnace and the boiler over and around it, and it may be under it, we centre the grounds upon which the economy, efficiency, and heating power of the fuel and boiler are to be determined. The furnace should be of such a kind as to insure the complete combustion of the fuel, and the boiler must impart to the water the utmost amount of heat to be obtained from the fuel. Our subject, therefore, divides itself into three parts—the furnace for the generation of heat, the boiler or agent to extract the heat resulting from the combustion of the fuel employed, and the circulating or heating medium.

I shall take these in reverse order, for the very obvious reason that gas, exceeding in heating power all other kinds of fuel, first claims attention, and from the great number of conservatories and greenhouses in and near our towns capable of being heated by gas it is, probably, of the greatest importance. I am sanguine enough to think that gas will entirely supersede the dirty, smoky, and extravagant use of coal for all household purposes for which the latter is now employed. Nothing has contributed more to our national prosperity than coal, but nothing has been used in so heedless and wasteful a manner. The waste of the heating power of coal is no doubt greatest in domestic consumption. Half, and more, of the heat afforded by coal is lost by the open fire-grate and chimney in our dwellings, and it is there for obvious reasons it should be most economised. Wealth is gained by labour of head and hand, and part, a considerable part, is spent in securing for its possessor the comforts and necessities of life—i.e., cooked provisions, dryness, and warmth. In manufacture the loss is not nearly so great, for the profits are calculated by the greatest manufacturing power from the least possible consumption or expenditure of material. To lose half the producing power of any substance would be to make in the profits of manufacture a proportionate reduction; but though he has a knowledge of this the manufacturer is as careless as everybody else about his

house fires. It is worth his attention to get as much out of coal as he can in the laboratory of wealth, but he cares so little for it at home as to allow half the heat of the coal to be driven up the chimney. Some hints will be given as to economising heat, not only in warming horticul-tural structures, but in dwellings as well, when I come to treat of boilers heated by coal.

As regards the circulatory or heating medium, water in a boiler being acted upon by heat is dilated, it is made lighter, and the heated particles ascend, whilst the cold descend by reason of their greater specific gravity: hence circulation is produced, and the water in the descending pipe is heavier, because colder, than that which is in the boiler, and therefore displaces the warmer and lighter water. This circulation once established forces all the water in the apparatus to pass successively through the boiler by which it is primarily heated. The action and reaction given the water in the boiler proceeds until all the particles are uniformly heated, the water becoming stationary as the heat is exhausted. A properly-constructed apparatus with a fire at the lowest point keeps the water in continual motion; as the hot water passes out at the top of the boiler cold comes in at the bottom to supply its place. It is, therefore, necessary that all boilers should have a free passage for the heated water to flow out at, and an equally free passage for the cold water to enter at the lowest point. It is not only important that there should be a passage for the hot water out and the cold water into the boiler, but that the passage should be free throughout the pipes or circulatory medium, and that must not suffer disconnection, as would be the case were air to lodge and cause a stoppage of the circulation. There should not, therefore, be any air remaining in the apparatus after it is filled with water, otherwise there will be obstruction to a greater or less extent according to the amount of air. To let out the air, pipes must be inserted at the highest parts of the apparatus, for the air will become fixed if not liberated by an air pipe, and the circulation impeded. The air pipes must be taken up above the highest level of any of the circulatory pipes, and for the due expansion of the water from heating should not be less than 9 feet in length or perpendicular height above the highest point of the apparatus. If of less height the water is forced out of the mouths or ends of the pipes. A small metal three-quarter-inch gas pipe galvanised, or lead half-inch, strong or heavy, as the lighter descriptions soon wear out, answers very well, the end of the pipes being bent downwards to prevent anything getting in and closing them. These air pipes ought not to be taken outside or communicate by their ends with the external air, as I have known the water freeze in them; therefore for any good they are they might as well be dispensed with; but we must, nevertheless, have the air out of the pipes, and allow space sufficient above the other parts of the apparatus to hold the water on its expansion, and hence I do not advocate air pipes with taps, though there is no objection to them when the circulating medium is employed in heating different compartments on varied levels. These short air pipes with taps ought to be employed at

the highest point of the apparatus in every instance; those on any level but the highest, by which the air is to escape in filling the circulating medium, should be closed when the hot-water pipes are full. The taps may need to be opened occasionally to let out any accumulated air, but only so long as to allow of the space thus freed of air being filled with water. These pipes, with taps to let out the air, are objected to by most persons who construct apparatus for heating by hot water, but to what the objection is taken I cannot make out, as the heating in such cases is quite as satisfactory as when the air pipe is open. Note.—I am here alluding to heating houses on different levels. On the lower levels I say taps are good, or better than any number of feet of open-air pipe; but on the higher levels air pipes of some length are necessary, and it is well if the circulating medium is not quite filled with water, but so much so as to allow of the circulation of the water. This affords space for the expansion of the water as heated. Either we must allow space for the expansion of the water or have air pipes communicating with the external air, and such I have had frozen-up in severe weather, and completely useless.

The supply cistern will need to be fixed at such a level as not to fill the pipes on the highest level more than three parts full of water; or if so high as to fill them the air pipes must be taken up higher than the supply cistern, and their ends communicate with the external air (which, for reasons already given, I do not advise) to allow of the water passing out of them, as it will when the boiler is hard driven or the swell of the heated water greater than the pipes can contain. The pipe from the supply cistern should enter the boiler at its lowest point, or the return pipe by a syphon, which, whilst it will admit of the cold water from the supply cistern being drawn into the boiler, will prevent hot water flowing up it. But a better plan is to have a self-acting valve at the mouth of

the supply pipe in the supply cistern, which will be drawn up by the suction of the water when the boiler is feeding, and closed when the pressure of the water is from the boiler into the feeding cistern, and which occurs when the pipes are filled to the level of the water in the cistern and pipes alike, as it only is in this case when the water is not heated. Water will always find its level: when it is hot it will fill more space than when it is cold, and it must expand into the air pipes, and be driven out of them when boiling, so wasting water, or fill the supply cistern to overflowing, or space in the highest level of the pipes must be left to allow for the swelling of the water. No hot water ought to work up the supply pipe, and that it is prevented from doing by a self-acting valve as above described.

If the houses are on different levels it may happen that those on the lower level have to be heated whilst the higher ones are not heated, the latter being shut off. The air pipes and space left for the expansion of the water are of no use to the lower levels in this case, but the water will expand all the same. To meet this I would have an air pipe on the main from the boiler, which would allow for any expansion and boiling-out, and its end might terminate in a gutter or drop-spout, only I would have it not exposed to frost. With a pipe of this kind air pipes may be dispensed with, only we must have taps at the highest parts on all the levels, to allow of filling the pipes with water, and to let out any air that may accumulate. Water being driven out of the air pipes in houses in winter or at any time is a great nuisance and source of evil. I fear I have made this matter of air pipes, swell of the water, and boiling very complex, but I will endeavour to render my meaning clearer by a diagram; but I would just say that the supply cistern and pipe must be out of the reach of frost, and that it need not be larger than 18 inches long, 7½ inches wide, and 12 inches deep, and the supply to it should be regulated by a ball-cock.

In the above section it will be seen that the compartments heated are on six different levels. In describing them let us begin at A, the flow from the boiler, which, it need hardly be stated, is lower than any of the flow pipes. B is the return pipe to the boiler, entering it at its lowest part. The flow pipes throughout their length rise about half an inch in 12 feet, which is independent of the rise consequent on the levels; and the return pipes have the same fall to the boiler as the flow pipes have a rise from it, the return pipes being taken directly under the flow pipes. The direction of the water is intended to be shown by the arrows.

c Is a Mushroom house heated by a flow-and-return 4-inch pipe, a, b, on the same level as the main flow-and-return pipe, and having an air pipe c. This air pipe serves the whole of the apparatus as a swell and blow pipe now, but not when it was its original length; for when it was the same length as the other air pipes the water was thrown out first at one and then at another, causing quite a nuisance from the hot water dripping and the damp generated. To put an end to this, and have all the boiling or swell-out at one point, the air pipe was shortened to d—about 2 feet, and its end so contrived that the water would drip into a down or drop spout in connection with a drain. From that day to this, or about three years, there has not been any water thrown out of any of the pipes but this at d. Even when the heat is not wanted in the Mushroom house the water in the whole of the apparatus finds its level through the valve on the return pipe being left open, so as to allow of any swell being parted with through this air pipe. It answers, therefore, the purposes of air pipe for the Mushroom-house pipes, and as blow pipe as well for the whole apparatus.

n, Fernery heated by a flow c, and return 4-inch pipe f, on the same level as the main flow and return pipes, the pipes being one over the other, and with an air pipe at the highest point g.

e, Peach house heated by two rows of 4-inch pipes on the same level, but 2 feet above the main flow pipe, and rising to h where is a tap (at present a plug) to let out the air when filling the pipes, or any that may accumulate, it being occasionally opened for that purpose, and closed when water comes out. This, though having no air pipe always open, heats very quickly.

f, Peach house heated by three rows of 4-inch pipes on the same level as the other Peach house, or 2 feet above the main flow-and-return pipes, the pipes being all flows, there being an open air pipe i. The heating of this house is not so good as any of the others.

g, Stove heated by four rows of 4-inch pipes all round except the doorway, the four rows being 3 feet higher than the main flow-and-return pipes, and having air pipes at their highest points, j, j. There are also pipes for bottom heat to the centre bed, these pipes being 1 foot 6 inches above the main flow-and-return pipes, and having a short air pipe k coming through the bed, with tap on its end. The heating of this house is very good, especially the pipe beneath the bed, and with the closed air pipe.

h, Pit heated by two flow 4-inch pipes for top heat, and returns for bottom heat to the bed. The pipes are on a level 2 feet above the highest pipes of the stove, and their highest point is at l, where there is a tap to let out any air, which does not need to be done once in six months.

i, Pit heated by two 4-inch pipes one above the other, and

3 feet higher than the pipes in the pit last named. The flow pipe in this case is not more than half filled with water, it being the highest point of the apparatus, the water in this pipe when the apparatus is filled with cold water being level with that of the supply cistern *n*, as shown by the dotted line from *n* to *m*. This allows for the swell of the water; and though there is an air tap *m* at its highest point, and the highest point of the apparatus, which is left always open, there is no blowing-out of the water, as the swell and blow of the water is taken by the air pipe *c* shortened to *d*. Before the *c* air pipe was shortened the run-out at *m* of the water was constant when the apparatus was highly heated, and when closed the heating was very satisfactory, as it now is with the tap always open. This, I am convinced, it ought always to be, so as to allow of the water expanding and falling as the heating necessitates, and it should be from 1 to 2 feet higher than the blow-off of the water at *d*; or it would answer just as well to have the pipe full of water, and have taps in place of all the air pipes except *c*, which would require the taps to be opened occasionally to let out any air that will, if there be a high part of the apparatus, always find its way thither. Therefore it is best to have an air pipe at the highest part of the apparatus, and also one on all the levels, where, it being inconvenient to have air pipes, taps may be used, one of the air pipes having less length than the others, and it should be on those pipes which are in use whenever any part of the apparatus is in action. This is the case with the apparatus described, the heating of which is very satisfactory; the only thing to be wished for is an air pipe in place of the tap *m*.

The boiler is fed by the pipe *o*, 1 inch bore, which enters the return pipe *p* at a short distance from the boiler. On the end of this pipe in the supply cistern is a self-acting valve, the valve being drawn up when the boiler needs water, and closed when the pipes are filled to the same level as the water in the supply cistern. The supply of water to the cistern is regulated by a ball-cock.

The pipes in all the compartments are furnished with screw valves, they being on the return as well as the flow pipes, which prevents the water heating-up the return pipes, as is not an uncommon occurrence when there are only valves on the flow pipes. All pipes which leave the main flow-and-return pipes have valves, and directly those pipes leave it; so that there is no waste in heating pipes not required, the water, by the valves, being shut-off to a drop, which enables the boiler or furnace to be attended to for cleaning or repairs without having to empty the apparatus of the whole of the water. Thus the apparatus is sooner filled and sooner at work again than would otherwise be the case. The valves are 4-inch screw, and very satisfactory, which is more than can be said of many kinds, some being next to useless for shutting off the water.

The pipes used throughout are 4-inch, and the flow pipes one and all have a certain rise from the boiler, which is maintained through all the levels, the rise to the levels being direct, and the return pipes have a fall to the boiler corresponding to the rise in the flows, the pipes in no case being taken below the level which the return pipes have before dipping for passing to the boiler bottom. It is a fact in heating by hot water that when the heated water commences to fall it becomes cooled, and ought to pass at once to the boiler by the return pipe for the purpose of being again heated.—G. ABBEY.

### EUPHARIS AMAZONICA CULTURE.

THIS is one of the best flowering plants we can grow for all first-class purposes, either for the decoration of the dinner-table, the bouquet, or for ladies' hair. The treatment I give is as follows:—By the middle of February my plants will be out of bloom, then any that require it will be repotted; the soil composed of turfy loam and good leaf mould in equal parts, and one part rotten cow dung, with a little silver sand, and it will be better if a little charcoal be added. Mix these well together. Place a little of the coarsest of the soil on the crocks, then fill about half full. Select five good sound bulbs, placing four at equal distances round the edge of the pot and one in the centre, fill-up with soil, potting rather firmly. Give a gentle watering through a fine rose with tepid water, and place the pots in a light airy position in the stove. If the pots can be stood on bottom heat all the better. Let them remain there till May-day, then take them to a warm greenhouse, keeping them rather dry, and let them have the benefit of a good scorching sun. This is a very important point.

June 1st take them back again to the stove, gradually giving more water, and it will be very strange indeed if you do not soon see the bloom spikes coming up from amongst the bulbs. Once they are seen, this is the time to give liquid manure, but not before.

After blooming this time let the plants remain in the stove till the middle of August, then take them again to their country seat for about six weeks, giving them the benefit of all the sun they can have; after which they must be again taken to the stove and treated as before, and about Christmas you will have a good stock of blooms to cut from. This is all I can promise. I hear of some gardeners blooming them three times a-year, but I think it only occurs accidentally now and then—it may be a retarded bloom; but to bloom the same bulb three times a-year is more than I can promise, and I think is not practicable.

The important points are—1st, To mix the soil well together. 2ndly, Not to give too much pot-room, but to choose pots according to the size of the bulbs. Like all other plants, they bloom best when the pot becomes full of roots. 3rdly, Place a little moss over the crocks before putting in the soil, thereby keeping the drainage good. 4thly, After fresh potting be sparing of water until growth has commenced, or you may rot your bulbs. 5thly, Give them the full benefit of the sun as directed. 6thly, Do not give liquid manure until the bloom spikes appear, and do not put the plants in a corner after flowering.—JAMES R. POCOCK, *The Garden, Bromborough Hall, Cheshire.*

### THE ACHAN PEAR.

THE name of this very old favourite Pear appearing in THE JOURNAL OF HORTICULTURE (see page 52) awakened far distant memories, and I was pleased to think that your correspondent Mr. Taylor had found the Grey Gudewife, as I have heard it sometimes called, useful for culinary purposes, although hardly fit to take a place in the dessert. My experience with it, as well as with several other varieties of Scotch Pears, is exactly in accordance with that of your correspondent.

Having many years ago succeeded a Scotch gardener in a situation in one of the eastern counties of England, I was very much pleased to find that he had, a few years before he left the place, headed-down some inferior sorts of Pear trees, and had regrafted them with some of the best Scotch varieties, among which were the Grey Achan, the Muirfowl's Egg, the Green Pear of Yair, and several others, the names of which I cannot now recollect; but all of which I had known, and considered as of first-rate quality when in Scotland. So, as may be supposed, the trees had every necessary attention paid to them, and in due time they all came into bearing; but the fruit of all the sorts, with the single exception of the Green Pear of Yair, proved utterly worthless, and after several years' trial they were ultimately in their turn headed-down and regrafted with other sorts; so that I had come to the conclusion that it was vain to attempt the culture of those esteemed Scotch Pears in the eastern counties of England. But at the same time I thought it quite possible that a different result might be secured with them in the more mild and moist climate of the west. Perhaps some one of your many correspondents may be kind enough to inform your readers if they have ever known them to be successfully cultivated in any locality south of the Tweed; and it would also be interesting if some of your north-country correspondents, whose recollection may extend back some thirty or forty years, were to kindly inform us as to whether or not the fruit produced by these varieties of the Pear tree are as good now as they were then, and if they still continue to hold their own as regards quality with recent introductions. A recent writer would, it appears, have us to believe that the climate of auld Scotland is undergoing a gradual change for the worse, judging by the result of its effects upon vegetation; but whether meteorologists will be willing to entertain this hypothesis or otherwise remains as yet to be proved. And in the meantime it would be very interesting to know if this supposed deterioration of climate has had any palpable effect upon the quality, &c., of the hardy fruits of the country. I have always had an idea that the Cherry, the Gooseberry, and other bush fruit attained a degree of excellence in Scotland which they seldom acquired in the more southern parts of the island, and I am curious to know if this is still considered to be the case. I mention the Green Pear of Yair as being an exception to the worthless character of the Scotch Pears when grown in the eastern counties of England, and

this hardy variety is really worthy of a place in any collection, being a certain bearer; indeed I have never known an instance of its failing to produce a heavy crop, and the quality of the fruit is not to be by any means despised, but unfortunately it does not keep long.

If you will allow me to skip from Pears to Grapes, I will only beg to say to your correspondent Mr. Inglis that I think there is only one variety of the Mrs. Pince's Black Muscat Grape in cultivation; but this appears to be a variety which varies very considerably in appearance, as well as in quality, under the influence of varying circumstances, and I have seen Vines of this variety produce fruit so distinct from that of other Vines of the same sort, that had I not struck them all from eyes taken from one and the same plant—our only one at the time—I could hardly have believed them to have been the same. We, however, consider this variety here as the best of all late-keeping Grapes. It is grown in the same house with Lady Downe's, and both sorts have this season, as well as during others, ripened and coloured their fruit equally well, and that with little or no assistance from artificial heat.—P. GNEVE.

### SPOILING SOIL.

Nobody knows what a quantity of good soil is annually spoilt through an idea that it is not fit for use without preparation and admixture. The old stereotyped advice is, Procure turfy loam from an upland pasture, stack it up for twelve months, and then chop-down and mix with so much sand, leaf mould, peat, lime rubbish, &c. Now, one ought always to bear in mind that a soil naturally suited to the growth of a plant will last in good condition longer, and will grow that plant better, than any compound possibly can do; perhaps not so grossly at first as a stimulating mixture would do, but the quality of growth will be better, and the plant will be hardier and longer-lived.

If a good natural soil cannot be obtained, the next best thing is one of the very simplest mixtures; three ingredients will always be better than four, and generally two will be sufficient. Then why stack-up for twelve months and spoil all you have been so particular about obtaining—fibre in the turf? Decomposition of vegetable matter produces most of the food of plants; when there is no longer anything in the soil to be decomposed the plant will cease to grow. The greater part of the fibre in turf decomposes during the first twelve months, and the plants afterwards grown in it get very little benefit from past decomposition. New loam is quite doubly as strong as that which has been stacked-up twelve months, and most quick-growing plants will do much better in it, especially if the space for the roots is limited. There are, however, some plants which thrive in loamy soil that are not gross feeders, and for these unadulterated new loam might be too strong. Partial decay or mixing with a quantity of the ingredients generally used will alter all this. Such substances as mortar, sand, coal ashes, broken bricks, &c., act principally, if not altogether, mechanically, and it is only in very rare cases that the soil would not be better without them, for if they do not actually impoverish it, which I believe they do, they take up the space that good soil would occupy more profitably. If the soil is too heavy or of too close a nature, why not use something with it that will act beneficially in other ways as well as mechanically—charcoal or charred earth, for instance? Many people have an idea that plants will not do well without a great quantity of sand. Nothing can be further from the fact. I have not used half a bushel of sand to mix with loamy soil within the last six years. I find plants grow much more strongly without it. If they do take up silica there is generally a hundred times more than they want in any new soil. Again, people are constantly putting mortar in their Vine borders, because Vines are said to like lime. Perhaps they do, but I prefer giving it to them in the shape of broken bones.

Another common way of spoiling good soil is by mulching. Mulch with half-decayed manure round trees newly planted, is the regular advice. Why mulch? Is it to keep out the frost? If so, use something that is not half decayed, and as dry as possible. Is it to stimulate the plants? Plants with broken and bruised roots commence growing quicker in a soil that does not contain fresh manure. Examine a heavy soil in the spring that has been mulched through the winter, you will find it a stinking slimy mass which it will take months to sweeten. I have nothing to say against mulching trees that are planted late in spring to prevent the roots drying too fast. Generally speaking, for hardy trees, keeping the surface soil

loose about them will be better than covering.—WILLIAM TAYLOR, Longleat.

### HERBACEOUS LOBELIAS.

The old herbaceous Lobelias, so distinct from everything else, so quaint in appearance, are much neglected. I have for years taken great interest in these neglected old flowers, commonly called the Cardinal Flower, and I purpose giving you my notes and a few hints on their growth, hybridising, propagation, &c.

The oldest of all, *Fulgens* and *Cardinalis*, are fine indeed, especially in colour; but now I am happy to say there are many improvements. For a scarlet, one of the best is *Blazer*, a strong dwarf grower, and the flower intense scarlet; the foliage is ample, light green, covered with hair. The finest individual flower, and the most perfect, however, is *St. Clair*. The shape of the bloom is almost perfect, and the foliage reddish green and covered with hair. It is a tall and graceful grower.

*Dazzle* is another splendid variety. The spikes of bloom are from 3 to 4 feet long, and the intense vermilion of the flowers is very fine; the effect in a bed or border is grand. The foliage of this variety is very handsome, being rich purple blood colour. *Comet* is a very fine variety, a tall grower, with a brilliant vermilion flower. These beautiful plants when carefully looked after are not equalled by any other flower of the garden; their graceful spikes, 3 or 4 feet long, with their fiery snake-like tongues, are unique.

The scarlets are my favourites, but now we have white, purple, rose colour, blue, and other shades, and of these I will describe a few of the best.

*Alba grandiflora* is the best white, but it is a bad grower. I would not recommend it for beds.

*Leo Lespes* is a splendid and distinct variety, rosy pink, large flower, and fine spike. The plant is a strong grower. It is a first-rate sort for pots or border.

*Progress*.—Rosy magenta, large pips, and fine spike. A dwarf grower. Extra fine in pots; good in beds and borders.

*Roi des Bleus*.—Bright blue. Dwarf grower. Useful for pots.

*Purpurea Regia*.—Fine pure purple flower. A profuse bloomer, growing and branching, making a pyramid. Fine for borders or pots.

*Ringleader*.—Light rosy purple, fine. Free grower. Very strong.

*Syphilitica*.—Fine, large, ample foliage. Flowers pale blue.

I have enumerated only the finest sorts for pots or beds, either for the conservatory or garden decoration. They are old friends, and only want to be seen and known to be loved by those who can appreciate the beautiful.

The soil in which they thrive best is sandy loam with plenty of very rotten manure and water. A damp situation is particularly suitable for them. They make splendid plants 4 and 5 feet in height in large pots, and their brilliant blooms render them very effective for decoration. They should be potted in 8 or 10-inch pots in sandy loam with plenty of rotten manure. Let the drainage be carefully attended to. Charcoal in the large pots to the depth of 3 inches is not too much.

Lobelias will withstand a mild winter out of doors, but the best way to treat them is when out of bloom to cut them down to within 6 inches of the ground; they will die down nearly to the root, and then send up small shoots, which can be potted-on for another year. They also grow very well, if layered in leaf mould and sand, by cutting the bottom of the plant partly through and layering it in the ground, first plunging the pot. Give a small cut at every eye under the stem, and peg it down to the soil with hair pins. Put a slight sprinkling of soil over the top. They will likewise strike from cuttings in the spring.

Lobelias are very interesting to hybridise. Last year I took a plant of *Leo Lespes*, and impregnated every flower individually with another sort of a different colour. The result is that I have now upwards of a thousand plants with flowers of all colours, from which I have selected some splendid varieties.—EDWARD SUEXTON, Hale Farm Nursery, Tottenham.

IMPROVED ROUND-LEAVED BATAVIAN ENDIVE.—“A” has certainly not had the right sort for Improved Round-leaved Batavian Endive, as it is totally different in habit from Fraser's Improved Broad-leaved, and more nearly resembling the old Batavian, but having a darker green colour and a much larger heart than that variety. It is also hardier, and altogether a real

improvement. I do not consider Fraser's any improvement on the old sort.—WILLIAM TAYLOR, *Longleat*.

### GRAPES THROUGHOUT THE YEAR.

I SEND you a few berries of Mrs. Pinee and Lady Downe's Grapes. They were cut from the Vines on the 13th of this month, from a house that I began cutting from in the middle of last July. The sort I had ripe first was Royal Muscadine. I had between three and four hundred bunches in all, and they have been generally very good. I think six months is a good long season to cut from one house, but I have an opinion that I could have cut until the seventh month without doing much damage to the Vines; but I will not hold that it would be any advantage to them to let a few bunches hang until you started the house, then cut them. I started the house last year in the middle of February, but did not cut off the wood, or it would be a bad thing in the way of bleeding, but rubbed-off the eyes as they broke, and cut the wood off at a later season, when the Grapes began to colour.

A good judge told me a few days ago he thought these Grapes would keep nearly two months longer in a good Grape-room in bottles or in a Beetroot—that would be making eight months; and a nice little house for early forcing would soon complete having Grapes eleven months out of the twelve, as I think to have new Grapes by May, and that would be good work. I have found many faults with this vinery. It was planned and planted before I knew it. I should be pleased to describe its construction to you if you think it worth while.—THOMAS MAYES, *Gardener, Crowcombe Park*.

[The Grapes are in perfectly good condition, and from the greenness of the stalks would, as suggested, have kept two months longer; they were superior specimens in every respect. We shall be obliged by the description you offer, and by details of management.—EDS.]

### ROYAL HORTICULTURAL SOCIETY.

WE have been requested to publish the following letter:—

"Royal Horticultural Society, South Kensington, S.W.,  
"January 21, 1874.

"SIR,—I shall be much obliged if you will allow me to refer in your columns to a circular which has been sent to Fellows announcing the formation of a Vote-by-proxy Association.

"The Council do not suppose that a paper so intemperate will in any way commend itself to the Fellows, and they certainly do not propose to put the Society to the expense and annoyance of issuing a counter-circular; but they think it desirable to point out by this means, with your indulgence, that the principal allegations in the circular, signed by Lord Alfred Churhill, Mr. Bateman, &c.—viz., 1, 'That the Council did not summon the meeting of the 8th inst. within the period directed by the bye-laws'; 2, 'That they have set the Fellows at defiance'; 3, 'That the Council represents only such Fellows as desire to keep the Kensington Gardens as a pleasure garden, at the expense of the interests of horticulture'—are absolutely untrue.

"The Council are amazed that such unscrupulous statements should have been made, and also at the questionable ingenuity by which the names of Fellows who are said to have expressed opinions in favour of proxy-voting are attached to the circular embodying these statements.—I have the honour to be, sir, your obedient servant,  
"W. A. LINDSAY, *Secretary*."

### THE SEASON.

THE mildness of the weather is bringing out the spring flowers early. At our two gardens on Weybridge Heath there are now in bloom—

Cyclamen Atkinsii	Primula denticulata
colum	Lithospermum prostratum
colum album	Erica carnea
verum	codonoides
ibericum	Daisies
Iberis gibraltarica	Yellow Crocus
Arabis procurrens	Erantibus hyemalis
Anthriscus daboidea	Helleborus niger
Hepatica angulosa	Colchicum autumnale fl.-pl.
single mauve	Ja-minum nudiflorum
single pink	Lonicera fragrantissima
single blue	Violet Czar
Primroses	Russian

—GEORGE F. WILSON, *Heatherbank, Weybridge Heath*.

CHYMOCOCCA EMPETROIDES.—It is a most lovely little bush, in my opinion, and the fruit, which is scarlet orange in hue,

is rather pleasant to the taste. I never saw it growing anywhere at the Cape, excepting on the seashore, amidst the most arid sands, where it seemed to thrive and flourish amazingly. I have often eaten the berries, which are, as you say, about the size of a pea.—G. B.

### MY WINTER GARDEN.

I PREFER to any glass roof that Sir Joseph Paxton ever planned that dome above my head, some three miles high, of soft dappled-grey and yellow cloud, through the vast latticework whereof the blue sky peeps, and sheds down tender gleams on yellow bogs, and softly-rounded Heather knolls, and pale chalk ranges gleaming far away. But, above all, I glory in my evergreens. What winter garden can compare for them with mine? True, I have but four kinds—Scotch Fir, Holly, Furze, and the Heath; and, by way of relief to them, only brows of brown Fern, sheets of yellow bog grass, and here and there a leafless Birch, whose purple tresses are even more lovely to my eye than those fragrant green ones which she puts on in the spring. Well, in painting as in music, what effects are more grand than those produced by the scientific combination, in endless new variety, of a few simple elements? Enough for me is the one purple Birch; the bright Hollies round its stem sparkling with scarlet beads; the Furze patch, rich with its lacework of interwoven light and shade, tipped here and there with a golden bud; the deep soft Heather carpet, which invites you to lie down and dream for hours; and, behind all, the wall of red Fir stems, and the dark Fir roof, with its jagged edges a mile long, against the soft grey sky. An ugly, straight-edged, monotonous Fir plantation! Well, I like it, outside and inside. I need no saw-edge of mountain peaks to stir up my imagination with the sense of the sublime while I can watch the saw-edge of those Fir peaks against the red sunset. They are my Alps—little ones it may be; but after all, as I asked before, what is size? A phantom of our brain—an optical delusion. Grandeur, if you will consider wisely, consists in form, not in size; and to the eye of the philosopher, the curve drawn on a paper 2 inches long is just as magnificent, just as symbolic of Divine mysteries and melodies, as when embodied in the span of some cathedral roof. Have you eyes to see? Then lie down on the grass, and look near enough to see something more of what is to be seen, and you will find tropic jungles in every square foot of turf, mountain cliffs and *debris* at the mouth of every rabbit-burrow, dark strids, tremendous cataracts, "deep glooms and sudden glories" in every foot-broad rill which wanders through the turf. All is there for you to see if you will but rid yourself of "that idol of space;" and Nature—as everyone will tell you who has seen an insect dissected under the microscope—is grand and graceful in her smallest as in her hugest forms.

The March breeze is chilly, but I can be always warm if I like in my winter garden. I turn my horse's head to the red wall of Fir stems, and leap over the Furze-grown bank into my cathedral, wherein, if there be no saints, there are likewise no priesthood and no idols; but endless vistas of smooth red green-veined shafts, holding up the warm dark roof, lessening away into endless gloom, paved with rich brown Fir needle—a carpet at which Nature has been at work for forty years. Red shafts, green roof, and here and there a pane of blue sky—neither Owen Jones nor Willement can improve upon that ecclesiastical ornamentation—while for incense I have the fresh healthy turpentine fragrance. There is not a breath of air within; but the breeze sighs over the roof above in a soft whisper. I shut my eyes and listen. Surely that is the murmur of the summer sea upon the summer sands in Devon far away. I hear the innumerable wavelets spend themselves gently upon the shore, and die away to rise again. And with the innumerable waves come innumerable memories and faces which I shall never see again upon this earth. I will not tell even you of that, old friend. It has two notes—two keys rather—that Aeolian harp of Fir needles above my head; according as the wind is east or west, the needles dry or wet. This easterly key of to-day is shriller, more cheerful, warmer in sound, though the day itself be colder; but grander still, as well as softer, is the sad sighing key in which the south-west wind roars on rain-laden, over the forest, and calls me forth—being a minute philosopher—to catch trout in the nearest chalk stream. The breeze is gone awhile, and I am in perfect silence—a silence which may be heard. Not a sound, and not a moving object—absolutely none. The absence of animal life is solemn—startling. The ringdove, who was cooing half a

mile away, has hushed his moan; that flock of long-tailed titmice, which were swinging and pecking about the Fir cones a few minutes since, are gone; and now there is not even a gnat to quiver in the slant sunrays. Did a spider run over these dead leaves? I almost fancy I could hear his foot-fall. The creaking of the saddle, the soft step of the mare upon the Fir needle, jar my ears. I seem alone in a dead world. A dead world, and yet so full of life, if I had eyes to see! Above my head every Fir needle is breathing—breathing for ever; currents unnumbered circulate in every bough, quickened by some undiscovered miracle; around me every Fir stem is distilling strange juices, which no laboratory of man can make; and where my dull eyes see only death, the eye of God sees boundless life and motion, health and use.—(*"Prose Idylls,"* by Charles Kingsley.)

### A TABLE FOUNTAIN.

A TABLE fountain, simple in construction and action, and admitting of any desirable degree of ornamentation, has been

Table Fountain.

recently patented in the United States. The sectional figure annexed will render a description of it clear. It consists of a pedestal, which may be of cast metal, porcelain, or wood, turned and ornamented in the lathe, while the basin may be of glass, metal, or other suitable material, with metal rim adorned, as in the specimen illustrated, with lions' heads, supporting chains, &c., while small cups *D* are attached to the inside as receptacles for flowers, Ferns, &c. Just beneath the jet, too, is a tulip-shaped receptacle for flowers; and the handles of the plugs *C* may be ornamented in shape as shown, or else be concealed beneath the water. In the cylindrical hollow of the pedestal a heavy plunger *A* fits water-tight; through the centre of the latter the rubber tube *B* passes, ending in a flap-valve pierced with a small hole, of sufficient size, however, to supply the jet with the requisite quantity of water. The hollow of the pedestal is separated from the basin by a perforated cap supporting the jet and containing the two plugs, which are connected to the plunger by chains or cords. To set the fountain at work all that is necessary is to fill the basin with water, which will also run into the hollow pedestal, till the desired height is reached. The plunger is then pulled-up by means of the plugs or the handles *C*, the water passing

through the hole in its centre, and beneath through the flap-valve; on restoring the plugs to their position the plunger descends, and the water is forced through the pipes to the jet, where it rises to a height varying with the size of the jet and the weight of the plunger. It is obvious also that the fountain will play for a longer or a shorter time according to its size; but it is so easily started again that its action may be considered as virtually continuous. The water, of course, may be coloured or perfumed, though such a proceeding might not be relished by gold-fish, which would otherwise live tolerably healthily in the glass basin of such a fountain. A tap should be fitted at the bottom of the pedestal for drawing-off the water when desired.—(*English Mechanic.*)

### MRS. PINCE'S BLACK MUSCAT GRAPE.

I WAS about to write a few observations on this Grape when the Journal came to hand, bringing Mr. Inghis's queries and interesting notes. It is the first dawn of there being two varieties. I will, however, speak of one, and what I may term its caprice. The Vine came from Exeter direct and is true. It was planted in a new vinery with Alicante, Muscats, and Lady Downe's. In due time they arrived at a fruiting state, and produced fine bunches. The first year of fruiting the house was not heated—that is, only sufficiently to exclude frost from bedding plants in winter. The Vines started naturally, and were carried-on with little more than sun heat. The Muscats and Lady Downe's did not ripen even moderately well, Alicante was better, and Mrs. Pince the best of all—that is, really very good both as to colour, flavour, and keeping. That is under what I call no heat.

Next, the house was heated by hot water, and a higher but not really high temperature sustained—high enough to ripen Muscats, Alicante, and Lady Downe's, which were and are good to look at, to eat, and to hang, but Mrs. Pince fails in all these requisites. In a word, it is not ripe. Is not that strange? I must confess myself puzzled not a little by it, and can only suggest one explanation which I shall come at in a moment. In 1872 a Vine of Mrs. Pince in a house of Hamburgs receiving no artificial heat produced really nice Grapes, well-coloured and good, but not perfectly ripe for long keeping. In 1873 the Grapes of this Vine were neither well coloured nor good to eat. How is this? The first suggestion is, the summer of 1873 must have been colder than that of the year previous; but it is not so, as I find on reference to temperatures carefully taken on the spot, that the total means (day and night), for the months from March to October, both inclusive (the growing months), was, in 1872, 53°, and in 1873, 53½°. I was struck to find them so nearly alike. The point, however, is in favour of the year in which the Grapes did not ripen; the year in which they did being slightly the colder, much the duller, and infinitely the wetter.

I am not for a moment disposed to think that these unpropitious conditions are in favour of the Grape, but rather that it was not a question of temperature at all. The finest Grapes I ever saw of Mrs. Pince were grown in warm Black Hamburg (not Muscat) temperature. They were in all points perfect. The following year, under the same temperature, they were by no means so good. They are in an outside border, and it might be surmised that the deluge of 1872 might have caused injury to the roots; but against this idea is the fact of the Vine first noticed—the one amongst Muscats—which is planted inside. The differences here noted are not, therefore, due to temperature or root-watering variations, and I am driven for a solution to the foliage.

I will now state a belief, and I invite correction, that Mrs. Pince requires to carry more foliage than any other variety to thoroughly perfect the fruit. Wherever I have seen it first-rate there has been foliage in abundance—a great proportion of leaves to bunches. In the variations in question there were in the successes a few bunches and a long growing rod above the fruit; in the failures, more bunches and a much shorter rod of growth-extension. That was necessarily so. But what about the side growth? Well, I believe it was simply too much restricted, and herein was a great if not the whole source of the failures. If, say, Hamburgs will perfect themselves when stopped at two leaves from the bunch, I say give Mrs. Pince four, five, six, if there is room for such to expand without crowding. Look at the surface of the leaf of Mrs. Pince and one of Black Hamburg. Lay one on the other and measure the difference in breathing, elaborating power, and see the loss in superficial inches which must be debited to Mrs. Pince.

Is there nothing in that? I think there is, and it tells us to leave two leaves on this variety when we would leave only one on most others. So far as my observations extend, practice sustains the theory of the matter.

There is no doubt that this is a grand Grape when well grown, and everything throwing light on its peculiarities or nature is demanded to add to its virtues the one that is lacking—viz., certainty of perfection. My contribution is, Let it carry plenty of foliage; do not restrict violently; follow no rule rigidly; but let it go as far as possible, providing only—and this particularly—against overcrowding. This given, I think there will be little to fight for in the matter of a few degrees of heat more or less, and on this point I will not enter the lists at all, not being able to speak practically and with that accuracy necessary to approach this element of its culture.—J. WRIGHT.

### SOIL CULTURE.

It will never hurt an intelligent man to know why he does things. Rather will he profit in this, that he can better adapt himself to circumstances. There are in horticulture hosts of practices—all good practices—about which none of us know the reasons, or if we reason at all, reason wrongly; and hence we often do work which might as well be undone for all the good it is to us.

There are innumerable things in greenhouse-building and greenhouse-warming, in plant-growing and fruit-culture, the labour on which is absolutely thrown away, simply by doing what others have done, without knowing why they did it; and yet the practices may have been very good in themselves at the time and for the purpose, whatever it may have been, but of no avail to the purposes of the modern imitators.

It is not long since the writer was talking with one of the leading scientists of Europe, and wishing to learn the present condition of physiological science, introduced the topic of root-growth. It was contended by our really learned friend that roots could only grow well when in very loose soil, which soil must be very loose in order to "admit air to the roots;" for, "without a free communication of the roots with the atmospheric gases, rapid growth was impossible." He was at once referred to Grape Vines, which, for mere experiment, had been set in what might be termed a *turnpike* road. It was, in fact, the side of a road which had been heavily stoned, and over which horses and heavy carts have been running for twenty years. The "turnpike" had to be torn open with a pick to admit the Grape Vine roots, and the material picked out, filled-in again after the roots were set in. Yet these Vines make an annual growth of 20 feet, and bear fruit of the very best description. The grower top-dresses with rich manure, prunes "according to the art," and so forth. The plants have the best professional treatment, but "loose soil to admit the air" they have not. Our friend looked at the illustration, shook his head, and passed on. It is a question whether the circumstance will ever be called up again to his mind. He will yet teach that plants "must have loose soil" as strenuously as ever. He will no doubt think that one or two instances are exceptions; and yet on "one or two facts," or experiments, as they are generally called, by not merely "one or two," but often by one original observer, most of the current literature called vegetable physiology is founded. If "one or two" plants can grow magnificently in hard solid soil, but with an abundance of good fertilising matter, without being "loose to admit the air," why may not a thousand?

But these "one or two" facts are not the only ones. The writer is in favour of ploughing and digging our soil very much as before. There are many reasons why we must do so; but if we ever believed that the mere loosening of the soil was to be one of these reasons, it is clear, from these facts, we should be worse than an idiot to continue on in that belief. We shall have to dig and plough and cultivate for many reasons; we often do so now because we think the roots require this; but where there is no other reason than this, we may save ourselves this much labour and expense. With abundant plant food they will take care of themselves.

We mentioned these circumstances to Mr. Vickroy, who has charge of the experiments at the Industrial University. He sustained "one or two" facts by his own experience with corn. For four years corn had been planted in two lots side by side. In one the ground was manured and "worked" in the usual manner for corn, in the other it was manured in the same way without any working. There was no difference whatever in the crops produced from either lot.

Now, because these facts are true, we do not propose to stop all digging or ploughing-up of the soil—we propose to go on as usual.—(*American Gardener's Monthly*).

### FLOWERS FOR OUR BORDERS.—No. 25.

SCUTELLARIA MACRANTHA.—LARGE-FLOWERED SKULL-CAP.

Though less showy, perhaps, than some other of the Lipworts, many of the Skull-caps are very ornamental plants, and none more so than the *Scutellaria macrantha*.

It is a native of Eastern Asia, and appears to be widely spread, extending, according to Sir William Hooker, to the great wall of China, where it was detected by Sir George Staunton. As might have been anticipated, it is perfectly hardy and of easy cultivation and increase. It is an herbaceous perennial, scarcely exceeding 1 foot in height, with angular,

*Scutellaria macrantha*.

branching stems, and opposite, entire, lance-shaped leaves, and forming when sufficiently strong a spreading bushy tuft. The very handsome purple flowers are produced in long terminal spikes, and are larger than those of any other species known to us. The plant seeds freely, and may be readily increased by these means, as well as by division of the roots, or by cuttings under a glass, either in the border or frame. Seedlings usually flower the first season if sown early, and should be transplanted from the seed pan while young, as they will suffer less from removal than at a more advanced state of their growth, when their tap-like root is more developed.

With regard to soil, a mixture of good loam and decayed leaves or manure appears to best suit this plant, though it will probably flourish in any good garden soil; for many hardy plants, like individuals, possess the happy faculty of adapting themselves to situations of diverse character, provided that they are not of too extreme a nature.

It disappears so entirely during the winter months that it is advisable to mark its place in the border by a label of some description, for much injury is often done to plants of a similar character when the borders are dressed in spring, from ignorance of the precise locality of their roots.

When first introduced this plant was recommended by Sir W. J. Hooker as a desirable one for planting in masses, and now that its seeds are readily procurable at a reasonable rate, its employment for this purpose may be fairly made the sub-

ject of experiment, as its flowering season is of considerable duration. The effect would probably be enhanced by planting it in association with the yellow-flowered *S. orientalis*, a plant of similar habit and height. It must, however, be conceded that neither of these plants can vie in brilliancy with the plants usually employed in bedding, and their proper place is, perhaps, the front row of the mixed border.—(W. Thompson's *English Flower Garden*, Revised by the Author.)

## A CENTURY OF ORCHIDS FOR AMATEUR GROWERS.—No. 18.

### CALANTHE.

In this genus we have two sets of plants, each widely different in habit of growth. The species and varieties here included are all winter-flowering plants, and yield a profusion of lovely flowers, alike useful for button-hole bouquets or the embellishment of a lady's hair. Unfortunately they lose their leaves about the time the scapes appear, and therefore are despised by many; but if a few Ferns are grouped amongst them the want of their own leaves is never felt, indeed some of the more coriaceous-leaved Ferns may be planted in the pots with them, and then it matters nothing. The compost the plants enjoy is a mixture of peat, light loam, good leaf mould, and dry cow manure in equal parts; and observe when potting not to elevate them upon a cone of soil, but pot like an ordinary stove or greenhouse plant, a little below the rim. During the growing season they enjoy an abundant supply of water, but after growth is complete it must be administered more sparingly, and therefore for this reason I have recommended the selection of coriaceous-leaved Ferns for planting with them, because they can better withstand a little deprivation of water. At this season, when potting should soon commence, the tops of the flask-shaped pseudobulbs may be broken-off and placed upon pots or small pans of sand, where, if kept moderately moist, they will soon start into growth and make fresh plants.

*C. VESTITA RUBRA*.—As before remarked, these are free-growing plants. They enjoy good heat when forming their pseudobulbs, but when in flower may be brought into the dwelling-house without injury. The flowers are very numerous, large and pure white, saving a blotch of rich reddish crimson in the throat. It blooms during winter and spring, and if kept dry the flowers last a long time in perfection. This season we have had another enemy to contend with in the shape of dense fogs, which singularly stripped our *Calanthes* of all the expanded blooms, and turned what few leaves remained upon them suddenly yellow. Native of Moulmein.

*C. VESTITA LUTEA*.—This is the exact counterpart of the preceding, saving in its having a large blotch of yellow upon the lip instead of crimson, which makes it very desirable as a contrast with the red-eyed variety; but I do not consider it so useful for head-dresses, because yellow in my estimation has a bad effect in a lady's hair. I may be wrong in this. What do my fair readers think on the matter? It is a native of Moulmein.

*C. VEITCHII*.—A truly lovely plant, and, what is more, a garden hybrid, having been raised in this country by crossing *C. vestita* and *Limnæodes rosea*. It produces spikes from 2 to 3 feet in length, bearing immense quantities of large, rich, deep rose-coloured flowers, the throat or eye being white. I shall, however, hope to say something more respecting this plant, with the Editors' permission, when recording the results of hybridisation of Orchids at a future time.

### CYMBIDIUM.

Very few members of this genus find favour with the professional Orchid-grower, although the two species here enumerated are exceptions to this rule. Some of the less beautiful kinds are not allowed to cumber the space. One, however, which I consider should find a place in every house is *C. sinense*; true, it is dull in colour, but then its fragrance is so delightful that for this alone it cannot be too highly recommended. These remarks will probably cause a laugh at my expense from some, but I cannot cast off my love for many of these good old things, much as I love the newer or more brilliantly-coloured species which are continually being added to our collections. It must be remembered I have not included this plant in my "Century," but have thrown it in for luck, so that my readers will please remember this if the colours do not suit their fancy. *Cymbidiums* should be grown in good rough fibrous peat, with a very little sphagnum mixed with it.

They like a good supply of water during summer, but less will suffice in winter; but at no time should they be dried-up, or the lower leaves will turn yellow.

*C. EBURNEUM*.—The species is both beautiful and rare, a desideratum of Orchid-growers of all grades. The plant is very handsome when not in flower; the leaves are narrow, somewhat erect, and bright green in colour; flowers large, and thick and fleshy in texture, pure waxy-white, saving the centre of the lip, where it is stained pale yellow. It usually blooms early in spring, and lasts in full beauty several weeks. Native of Assam.

*C. MASTERSII*.—In general appearance this resembles the preceding; the foliage, however, is somewhat broader, and more pendulous. The flowers are produced during winter, the spikes bearing numerous flowers, similar to *C. eburneum*, but much smaller. Native of the East Indies.—EXPERTO CREDE.

## NEW BOOK.

*The Treasury of Botany: A Popular Dictionary of the Vegetable Kingdom.* By J. LINDELLY and T. MOORE. Longman and Co. New and revised edition, with Supplement.

We noticed and commended this book of reference when it first appeared, and its revised re-issue with a Supplement of one hundred pages entitles it to another commendation. It shall be in one sentence—It is a very useful and trustworthy book. We give a specimen from the Supplement.

"*BORO DINA*.—The Feejee name of a species of *Solanum* (*S. Uporo*, also known as *S. anthropephagorum*) which, according to Dr. Seemann, 'ought in Feejeean estimation to accompany a cannibal feast. It is a bushy shrub, seldom higher than 6 feet, with a dark glossy foliage, and berries of the shape, size, and colour of a Tomato. The fruit has a faint aromatic smell, and is occasionally prepared like Tomato sauce. The leaves are wrapped round the bokola as those of the taro are around pork, and baked with it on heated stones. Even the white settlers use the leaves as a pot-herb.'"

## NOTES AND GLEANINGS.

It is announced from Vienna that a process, indicated by M. Hooibrenk, for FACILITATING THE FERTILISATION OF PLANTS has proved successful in the Botanical Gardens there. The process consists simply in touching the end of the pistil—that is, the stigma—in a flower with a pencil dipped in honey, or, better, in honey having mixed with it some pollen of the plant operated upon. A *Hibiscus mexicanus*, which had never yielded fruit, having undergone this treatment, produced quite a large quantity of good seeds. With several fruit trees the process also succeeded. Further, after operating on certain branches only of trees which did not yield fruit, it was found that fruit formed on these, while the branches left in the natural state gave none. The effect, if real, may be explained by supposing that the honey retains the pollen grains on the stigma, and thus favours the formation of a pollen tube, which is indispensable to the fertilisation.

— IN a letter to the French Society of Horticulture a chemist, M. Fremont, mentions that a good way of PRESERVING CUT FLOWERS in a state of freshness is to dissolve sal-ammoniac, or chlorhydrate of ammonia with the water in which the stems are put, in the proportion of five grammes per litre of water. They will thus often be kept fresh for a fortnight. The experiment is one which can be easily made.—(*English Mechanic*.)

— ALFRED DE ROTHSCHILD, Esq., has consented to preside at the thirty-first anniversary festival in aid of the funds of the GARDENERS' ROYAL BENEVOLENT INSTITUTION, to be held in the ensuing summer.

— PRIZE CUPS, of five guineas each, will be presented this year by Messrs. Sutton, at the Reading Horticultural Society's Spring and Autumn Shows; International Fruit and Vegetable Show, Belfast; Royal Berkshire Root Show, Reading; and Birmingham and Midland Counties' Show.

## CANADIAN ORCHIDS.

THIS peculiar and beautiful family of plants is tolerably well represented in Canada. They form an excellent example of the mutual dependence existing between the vegetable and animal kingdoms. When the flower is examined, it is evident that the only way in which most of the species belonging to this order can be fertilised, is by means of receiving the pollen

adhering to the wings and legs of insects. Thus we see that while the honey-seeking insect obtains its supply of food, it at the same time completes the final process necessary to the continued existence of the plant. Among the specimens in my collection obtained in this neighbourhood are the following:—*Orchis spectabilis*, *Habenaria fimbriata*, *H. phycodes*, *H. blepharoglottis*, *H. ciliaris*, *H. virescens*, *H. viridis*, *H. dilatata*, *H. Hookeri*, *Calopogon pulchellus*, *Cypripedium arietinum*, *C. pubescens*, *C. parviflorum*, *C. spectabile*, *C. acule*.

Almost all of these species grow on the boggy margins of the small lakes existing in this region. The show of *Orchis* and purple-fringed species (*O. spectabilis* and *H. fimbriata*) are remarkable for the beauty of the three or four purplish flowers borne on the spike; the former, unlike the latter, prefers the wooded hillsides. The white-fringed species is delicately scented, and is susceptible of cultivation, as, notwithstanding its habitat in low grounds, it flourishes well in the common flower pot when properly watered. The beautiful little *Calopogon* is found in the wettest portions of the bog, along with the round-leaved Sundew. The structure of the flower in this genus affords an interesting instance of the adaptation of means to an end in Nature. The pollen, instead of being connected by threads with a sticky gland for the purpose of adhering to the stigma as in the other genera, consists of loose powdery grains. In order that these grains may adhere to the stigma, it is broad and flattened at the apex, and covered with a beautiful array of white, yellow, and purple hairs with club-shaped ends. The stemless Lady's Slipper (*Cypripedium acaule*) is a delicate little species, growing in the shade in moist ground, and is closely allied to the two cultivated species—*C. insigne* and *venustum*. It bears only a single flower of rose-tinted purple colour, and is far more rare than the coarser yellow-flowered species.—C. M. P., *Owen Sound*.—(*Canadian Farmer*.)

## NOTES ON VILLA AND SUBURBAN GARDENING.

**DOMESTIC GREENHOUSES.**—Before entering on a description of this apparatus, the circumstances under which it was discovered may be briefly adverted to. Mr. Ward, the gentleman to whom we are indebted for the discovery, was a surgeon residing in Wellclose Square, London. From his earliest youth Mr. Ward had been attached to botanical pursuits, but living in a densely populated neighbourhood, surrounded by manufactories and enveloped in the smoke of London in its worst form, he had been compelled to give up the cultivation of plants, until the following incident served to point-out a mode by which he could follow his favourite amusement with some degree of success. He had buried the chrysalis of a Sphinx in some moist mould, which was enclosed in a close glass bottle covered with a top. In watching the bottle from day to day he observed that when exposed to the warmth of the sun the moisture rose from the mould and became condensed on the inner surface of the glass, and again fell back upon the mould during the night, thus keeping-up a continual moisture in the atmosphere within the glass. Thus the most forbidding local circumstances may be overcome; and any person, whether inhabiting the most humble or the most splendid dwelling, provided it be freely exposed for a few hours every day to the sun's light, has it in his power to rear and cultivate a miscellaneous collection of plants, to enjoy the beauty of their appearance, and to watch their progress through all the stages of their growth at an insignificant expense. To do this he must provide an apparatus consisting of a box, a stand, and a glass roof of a size according to his desires and means. We shall suppose one is wanted of a small size to stand in a window in an apartment of limited dimensions. The stand we will suppose is 1 foot 10 inches in height, the box which is to contain the soil  $8\frac{1}{2}$  inches, and the glass from 1 foot  $7\frac{1}{2}$  inches; in all 4 feet 2 inches in height by 3 feet in length, and  $1\frac{1}{2}$  foot in breadth. The bottom being properly fitted, the sides are fixed to it with brass nails, no iron being used in any part.

We now come to the preparation for the plants. Lay the bottom of the box with pieces of broken earthenware to the depth of 2 inches as an open subsoil. Next lay a stratum of turfy loam 1 inch deep, and fill-in the remainder of the space with soil composed of equal portions of peat and loam mixed, with about one-twentieth part of rough white sand free from iron. The artificial garden plot is now ready to receive the plants. Plant these in the usual manner, and then shower over them with a fine-rosed watering-pot from three to four gallons of water till the soil is pretty well saturated, and the liquid begins to run off by the two openings at the bottom. After draining thus for twenty-four hours cork-up the holes, place the glass case on the box, and the operation will be finished. After the first preparation the plants require little or no care; the case need only be opened for the removal of dead leaves, or for a little trimming when required. Plants in open flower pots are exposed to the vicissitudes of change of climate and require

constant watering, but the plants in these cases seem to be independent of any change of temperature in the air, and water themselves. The moisture rises by the sun's influence from the moistened earth, refreshes the leaves of the plants, and during the cool of the night falls to the earth again, condensed like rain and dew. In this there is a constant succession of rising and falling of moisture in imitation of the great processes of Nature daily going on in the fields around us. The plant-case is a little world in itself, in which vegetation is supported solely by the resources originally communicated to it.

**COLD PITS AND FRAMES.**—The principal requisite in preserving tender plants through the winter in these is to keep them dormant from October to the end of February, for as the growth of a plant depends more upon heat and moisture than upon other agents of healthful existence, it is obvious that the more cool and dry plants are kept, provided they do not suffer from an excess of either cold or drought, the more likely they are to be successfully preserved. For this reason both the plants and pits should be kept dry, by placing the pots on some material, such as dry ashes, that will absorb moisture, and by admitting all the air possible in favourable weather. Give air at all times when the exterior temperature is a few degrees above the freezing point, supply no water unless the plants are flagging, and then only in sufficient quantity to recruit their strength. Plants thus treated will scarcely be injured by the same amount of frost that would kill them in a growing state, provided they are kept closely covered until they are thoroughly but gradually thawed.

In protecting cold pits and frames the covering should never touch the glass, because if it do so it will absorb the heat from the pit and frames, and give it off again to the atmosphere; but if it is raised 1 inch above the glass, it repels the radiant heat, and thus a stratum of confined air is secured, which forms an excellent protecting medium. For this reason wooden shutters, frames thatched with straw, waterproof canvas or tarpauling, are superior to mats; and hence the necessity, when extra covering is required, of placing it above, and not between the usual covering and the glass.

**PLANTS IN ROOMS** should only receive water when in actual need of it; but they must be kept as near the glass as possible. *Pelargoniums* that are not so bushy as may be desired, must have the point of each shoot pinched out; and the same may be done with other plants of loose habit. Should the nights become very severe, it will be a good plan to place the plants under a table, surrounded to the ground with a large woollen cloth; and, as a further precaution, when necessary, a stone jar or two of hot water may be placed amongst them at the time of retiring for the night.

**KITCHEN GARDEN.**—Proceed with digging and trenching, except in snowy or frosty weather. The pruning and nailing of hardy fruit trees must be concluded as quickly as possible; but Peaches and Apricots will be best if left until the end of February. If the Peas and Beans sown in November appear above ground, a second crop of each must be put in at the first favourable opportunity; but if none were sown at that time, a crop of each must be put in without delay. A small crop of Early Frame Radish may be sown on any dry warm border sloping to the south, and may be protected by haulm or litter till the plants are up. Prepare dung, or dung and leaves where the latter are plentiful, by frequent turning, for beds for forcing Cucumbers and other vegetables. When these materials are dry they should be watered when turned over.—W. KEANE.

## "HOW TO GROW A ROSE."

PRAY don't think me vain. I know but little, but would impart that little to my fellow lovers of the Rose; and ere I begin I will beg of old practised hands to pass this article by, for I fear—nay, know—they will find nothing new here. I write this for the beginner, as there always are and must be beginners; else—but I won't moralise. Neither am I purposing to say how to raise new varieties edged and flaked like Carnations and Picotees, nor how to grow black Roses by budding on the Black Currant, nor how to grow bright sky-blue Roses by putting cobalt or sulphate of copper in their drinking water; for

"Thus the craftsman thinks to grace the Rose—  
Plucks a mouldy flower  
For his gold flower,  
Uses fine things that efface the Rose;"

but to make the most of what we have.

"First catch your hare" is a good old maxim, and "First get some cuttings or plants of Manetti" will be found an indispensable one to growing Roses on the Manetti stock. And having done so, select good medium-sized, well-ripened shoots of the current year; cut them into lengths of 8 to 12 inches, according to the number or closeness of the eyes thereon—a cutting 8 inches long is equally as good as another of 12 inches

with the same number of eyes; cut the bottom end of the cutting immediately below an eye, clean and level, without stooping; the top end to be cut just above an eye. All eyes are now to be cut clean out except the top two (see *fig. 1*).

I find the cuttings take better and grow stronger if two or three buds are left on than they do if one only is left.

Fig. 1.—One-third natural size. Cutting of Manetti ready for planting *a*, Lowest bud not cut out, and when planted to be earthed-up to *b*, Highest cut-out bud up to which the cutting is to be inserted in the ground.

Fig. 2.—One-third natural size. *a*, Rose shoot with buds. *b*, Stock showing T-cut for bud. *c*, Bud or shield just cut from shoot.

The cutting is now ready for planting, and the sooner this is done the better. I do not mean the same day, but if you let the cuttings lay a few days after preparing you must expect to see unsightly gaps where they have failed. My plan is to mark out a plot of ground in rows thus: Two rows 18 inches apart, then a space of 3 feet, then two rows of 18 inches apart, and so on till the plot or quarter is full. Having pegged-out the ground, we then set the line, chop out a shallow trench

with the hoe, and plant the cuttings. As to distance, it is a good deal a matter of taste, but 10 inches is a nice distance; either an inch or two closer or further apart will be of little consequence. Slightly lean the tops of the cuttings towards each other in the double or 18-inches-apart rows (see *fig. 3*). Let the cuttings be inserted in the ground to the topmost cut-out eye (see *fig. 1 b*), then tread very firmly, and earth-up so as to bring the soil level with the lower of the two eyes left intact (*fig. 1 a*).

The cuttings may now be left to themselves till the weeds begin to grow, when a scratch-hoeing will be requisite and advisable, both to destroy the weeds and to freshen-up the surface-soil, as the cuttings will be much benefited thereby. Should there be frost and light rains during the winter it will be well, when the soil is dry enough, to walk up the rows and tread firm again, as the frost will be found to have loosened the cuttings, which is not good for them. If heavy rains succeed the frost there will be no need, as it will have made the soil firm enough. September and October are the best months to get-in cuttings, but if you go in for a lot you may keep on planting till the end of the year. The small and rather unripe shoots may be cut into lengths and planted closely in rows to grow into plants for the next year, when they may be planted out during the winter for budding in the following year, or potted to use for grafting in the spring.

Fig. 3.—One-half natural size. End of double or 18-inches-apart rows. Soil cleared from stocks for budding. Shows also how to plant, leaning the tops towards each other. *a*, Bud inserted, top part of bark cut off so as to fit that of stock. *b*, Ditto tied.

There will be nothing else to do till budding time, except to keep down weeds. Do not be in any great hurry, as the Manetti is not so quickly unfit for budding as the Briar, and it is best to bud the Manetti after you have done the Briar. I say after the Briars, as I hope you will not give the Briar quite up; in fact, you must have it for Teas, &c., for although Teas will do well on the Boursault and some others, still the Briar for Teas and Noisettes. The first week in August is quite soon enough to begin, as I find, if the Manetti is budded too soon in the season, it is liable to overgrow and cover-up the bud; besides, you will get better, larger, and stronger buds later in the season, and they will not be so liable to start then. And now, all ye whose backs are long, who measure more than 42 inches round where the fifth button on your waistcoat is, who are liable to bilious attacks, headaches, swimming in the head, rush of blood to the brain, and other such evils that mankind is favoured with—take my advice, Don't go in for budding your own Manetti, but enjoy the good things of this world while ye may, and buy your Manetti plants ready worked, because it is possible, nay, probable, that

it wo'n't agree with you; and if standing on your head all day, with the glass at 98°, is not one of your special enjoyments, you wo'n't enjoy budding Manetti.

Well, all is ready, and buds got, nice plump ones. In getting buds, nice half-ripe shoots full of good buds should be taken where they can best be spared. I have been asked, "Do you cut the buds one at a time off the wood, or cut lengths of wood with several buds on?" Of course the latter (see piece

Fig. 4.—How to hold the bud when pulling-out the wood. As the bark and wood separate, slip the third fingers of both hands downwards gradually till the end is reached; by so doing the bark will hardly ever break.

of Rose shoot with buds, *fig. 2 a*)—I remember the time when I didn't know—set the shoots in a small can with an inch of water to keep them fresh; clear away the earth from your stocks—don't clear too many at once, as the bark soon dies, and then wo'n't work so well—down, or nearly down, to the roots; just rub your thumb and finger round the stock to clear from soil and thorns; make a cross T-cut (*fig. 2 b*), and insert the buds as in *fig. 3 a*; tie in the regular way (*fig. 3 b*), and in about a month the cotton may be removed. Should any buds have missed, insert others at once just below where the first

Fig. 5.—Stock with growing bud in May; top of stock properly cut off.

was put in. You may do this till quite the second week in October if the weather is warm, which it generally is, with a very good chance of the bud taking.

Oh! ah!—there now! I have forgotten I am writing this expressly for those who do not know. I well remember, when I began, the annoyance and vexation it was to me to find almost all writers "presume" that everyone knows such and such a thing as to the minor details, and that was the very information I wanted, and I have not said a word about pre-

paring and inserting the buds. Well, then, get good shoots of the sorts you are going to bud, with plenty of "fat frog-nose" shaped buds, such shoots as have borne flowers, or are about to do so; often these latter yield the best buds, as the former will have sometimes started, or even blind shoots—*i.e.*, those without flower buds, if they are not too gross and strong, or unripe and pithy. Medium-sized shoots are best, about the thickness of a "churchwarden clay" pipe-stem. As soon after you get the Rose shoot with buds I advise cutting-off the leaves, so as to leave the footstalk only (see *fig. 2 a*), as by leaving the leaves on, the bark of the shoot is much sooner shrivelled-up through evaporation than if the leaves are cut off, as there shown, and will keep plump and fresh much longer. Cut out the bud, as in *fig. 2 a* and *c*, with a thin slice of wood, and in budding Manetti you want a longer heel to the bud than for the Briar. Cut the bud with the bark about an inch long, about two-thirds above the bud, and one-third below; remove the wood as in *fig. 4*. I cannot explain it, but take

Fig. 6.—Finished plant, to be planted 4 inches above the junction of stock and scion, or to dotted line. *a*, How to cut back in March.

the bud in the left hand as shown there, take hold of the wood with the nails of the right thumb and finger, and pull it out. Do it without fear, and boldly, and you will not spoil one in a hundred. Now make a cut in the bark of the stock, as in *fig. 2 b*, with a cross-cut—mind your knife is always very sharp—lift the bark with the back of your budding-knife, and insert the bud, as shown in *fig. 3 a*. Push it well home; cut off level with the cross-cut, so that the bark may fit well with that of the stock; tie with candle cotton, not too tight, and tie with the knot behind, on the opposite side to where the bud is inserted (*fig. 3 b*).

I have been asked, "Should the earth be returned, so as to cover the stocks as before budding? Should the stocks be pruned or shortened now?" No, to both questions; leave them as they are, and the stronger they grow now the better plants you will get next year. In September and the following months to the close of the year, but the sooner the better, the shoots may be cut from the budded stocks to make cuttings as before, otherwise do not meddle with them till April, and then go over them often, and keep down the new shoots that the Manetti will be numerous and vigorously making. By that means the bud will be induced to start, if it has not done so already, and when grown 6 inches or more in May, cut the stock clean off just above the bud (see *fig. 5*). The cleaner this is done the better, although the Manetti stands rougher treatment than the Briar, and so is not of so much consequence. I even towards the end of May cut down those whose buds have not started, and so either make them start or kill

them, for a Manetti plant in a row of new-budded stuff is such a nuisance, it grows at such a rate as to smother the young plants right and left. Where any buds have missed altogether I pull-up the stocks to avoid the evil consequences of their great growth, as, when you are well off for stocks, a few are of no great note, especially when not wanted. Carefully remove any suckers that may appear, as, let the cuttings be ever so well prepared, a few will show themselves the first year; an old chisel is a capital tool for the purpose. In budding stock plants, the only difference is that you plant your cuttings in a piece of spare ground very closely, leaving room, however, to hoe between the rows to keep down weeds, and in the autumn of the following year lift them and plant very shallow in rows, or as you like. Earth-up the same as for cuttings, and in budding let the bud be put in as near the root as possible. This is really the royal way to work Manetti, as you can get the bud so much closer to the roots than by working the cuttings as planted; but in either way the practice is the same, and the instructions for working struck cuttings will apply in every respect. The new shoot from the bud will require staking and tying, or the wind will blow many out, and is almost as fatal, if not tied, as it is to the worked Briar. I have only now to say that in setting the plants out, plant them deeply, so as to cover the union of the stock and bud 4 inches below the surface (see fig. 6).

I have seen Manetti-worked plants, when they have been worked too far from the roots, stuck in with the union 5 or 6 or more inches above the ground and—doing wonderfully bad!

In pruning the plants cut them down in March to from 2 to 12 inches, according to the strength of the shoots, and so as to leave the top bud pointing outwards—that is, from the centre of the plant. It is always well to have an eye to the future form of the plant (see fig. 6 a) and keep the plant well open by thinning-out. Keep a sharp look-out for suckers; they will not trouble you much, but if one do get ahead it will utterly spoil and kill the plant, the growth is so strong and rapid. I was in a garden last summer where the dwarf Roses were almost without exception Manetti plants, and the proprietor, and his lady especially, wondered they never bloomed. Truly they must have been very badly worked, but in the present state of competition and love of cheapness I do not wonder at that. I am sure properly-worked Manetti plants cannot be grown at the price I have seen them advertised.

In No. 663, December 11, 1873, p. 463, Mr. J. Hinton speaks of the Manetti having flowered for the second time in his garden. This is a common thing with me every year, and on looking about a day or two back I found a truss of ripe hews which, out of curiosity, I have since gathered and sown. Ly-the-bye—a lucky thought—Mr. Hinton is mistaken in thinking I am “his anonymous correspondent.” I never do anything anonymously; besides, I love La France, and have had to do battle on its behalf many times in this town, one or two amateurs here abusing it unjustly—most unjustly, I think. I consider it one of our very best Roses, and I think I can see why such men as Mr. B. Cant call it names. They grow maiden plants only, on which it, like some others, is hardly ever fit to show; but use it well and grow it on and it is simply grand. If you want to find the way to a lady's heart, give her a good bloom of La France and ask her to smell it! “AMATEUR”—on the same page 463—don'ts the vigour of Roses on Manetti. I have now in my garden John Hopper, Duke of Edinburgh, Charles Lefebvre, and others, with shoots made last year 7 feet long and as thick as your thumb, enough for one season and all purposes.—W. FARREN, Cambridge.

## DOINGS OF THE LAST AND PRESENT WEEKS.

### FRUIT AND KITCHEN GARDEN.

SINCE January came in we have been enabled, almost without interruption, to continue out-of-doors operations in this department. Pruning is finished, and digging well advanced. Should any fruit trees remain to be planted the work ought to be done at once; they seldom succeed well the following season if planted after the buds have swelled considerably. The fruit buds on our pyramid Pear trees are in a very forward state.

Attention must be given to quarters of Cabbage plants; any spaces where plants have died-off to be filled with plants from a reserve bed. Stir the ground between the rows. Sow Cauliflower in boxes, to succeed that sown in autumn and now growing in hand-lights or under a wall to be planted-out. Celery for the earliest crop may also be sown in the same way as the Cauliflower; place the boxes in a very gentle hotbed.

Those who have not a forcing house for Cucumbers may now

sow in a hotbed. The best way is to make up a small bed for the seeds, and grow the plants on in pots till they have made good growth, when the frame should be ready for the plants; but do not plant them out if there is much steam, even if it smell “sweet.” It is a good plan to place 3 or 4 inches of old manure over the surface of the bed, and above this some freshly-cut turf with the grass side under; this will to a very large extent serve to keep the steam under, and allow the plants to be put out sooner than they otherwise would. Perhaps the best materials for a hotbed are leaves and stable manure in about equal proportions, to be thrown together in a heap, and allowed to lie for ten days, and to be turned over once or twice in that time. Before commencing to build up the frame some rough faggots of wood should be placed on the ground, and on these the fermenting material should be put; the principal object of this is to cause the heat to penetrate underneath the manure when linings are applied after the heat has declined in the frame.

Mice have been troublesome: they unearthed the newly-sown Radish seeds, and dug out the early Peas which are just coming through the ground.

### FORCING HOUSES.

*Pine Apples.*—Plants throwing up fruit will now require a moderately moist atmosphere, and the temperature not to fall below 65° in cold weather; on mild nights 70° will be better. It is well for head gardeners not to draw a hard-and-fast line in regard to temperature, especially in forcing houses. As the temperature varies out of doors, so it ought, to a certain extent, in the houses. To-night the thermometer may register 7° of frost, and on the following night it may not fall below 45°, and very often even greater discrepancies occur than are noted. Is it not folly to try to keep up an even temperature in hothouses under such circumstances? The suckers which were potted early in the autumn last year must now be potted; most of them will be planted at once in their fruiting pots.

We do not now use 15-inch pots even for the strongest-growing sorts, but we cannot obtain large fruit in 9-inch pots. When on a visit to Mr. W. Thomson's establishment at Clovenfords, near Galashiels, two or three years ago, it was marvellous to see the large handsome fruit swelling and ripening on plants of the Smooth-leaved Cayenne variety that would weigh 8 or 9 lbs., and none of the pots seemed to be more than 9 inches in diameter. It may be owing to the soil, or it may be owing to superior culture, to houses specially designed to the wants of the plants, or all combined. In our own experience we cannot get such fruit in 9-inch pots as in those 11 or 12 inches diameter. The loam to be obtained here is light and sandy, and in it the plants grow very freely, but the soil seems to become exhausted before the fruit is thrown-up. In this, as in many other things, circumstances alter cases. A good potting material is composed of rotted turf, crushed bones, and a sixth part of decayed stable manure. An 8-inch potful of bones will be sufficient for a barrowload of turf. Drain the pots well, and place some fibry material over the drainage, disentangle the roots a little, and ram the compost in quite firmly. Plunge the pots in a bottom heat of 90°, and fresh rootlets will soon form. Do not give any water at the roots for a week or ten days after the plants are potted.

We have been getting ready the soil for the first house of *Melons*. There is no old-cut turfy loam available; but we have some old spit loam of a clayey nature. This will be mixed with an equal proportion of the light turfy loam, and with the addition of a sixth part of rotted manure will make an excellent compost for *Melons*. There is no fermenting material used in the beds—the bottom is filled up with brickbats, leaving about 18 inches for the soil; and only one-half of the bed is filled at the time the plants are put out, the other half being made-up with fresh soil as soon as all the fruits are set. Where *Melons* are grown in beds or pits by the aid of fermenting material alone, the seeds may be now sown as has been directed for Cucumbers, the method of making up the beds being the same in each case.

*Cucumbers* in heated houses owing to the want of sun are making but little growth, and that very feeble. A minimum temperature of 65° is maintained, with a moderately moist atmosphere; too much moisture in the house causes an unhealthy growth. The earliest Strawberry plants are flowering profusely; going over the blossoms every forenoon with a small camel-hair brush facilitates setting. Every alternate watering ought to be with manure water. Cow manure or sheep's droppings is as good as any other. Guano water is easily made, but it is not desirable to use it on Strawberry plants in pots. *Dwarf Kidney Beans* should be well attended to, as a regular supply of this vegetable is very desirable, and is usually much appreciated. The pods should be gathered as they are ready, tied-up in small bundles, and placed in shallow dishes with just enough water to cover the stalk ends. Make fresh sowings if necessary. Perhaps the best way is to sow in boxes thickly, and as soon as the seed leaves are fully developed pot-off four plants in a 7-inch pot. Sowed Tomatoes in a little bottom heat in the Cucumber house. We do not require a larger supply of this wholesome esculent than can be grown in a dozen pots. The fruits are

generally ripe by the last week of May or the first in June. No other variety yet tried is so suitable for forcing as the Orangefield Dwarf Prolific; but being much pleased with the excellent crops of Hathaway's Excelsior which were grown on the open walls at Chiswick last year, this variety is being tried against it as a forcing sort. The fruit, moreover, is quite round, without ribs.

#### STOVE AND GREENHOUSE.

One of the most valuable occupants of the stove for furnishing us with cut flowers is the *Eucharis amazonica*. This plant is, if liberally treated, almost a continuous bloomer. Now is a good time to repot the plants; turn them out of the pots in which they have been growing, and if the bulbs are too close together separate them from each other, and allow more space when repotting. Turfy loam, with a little leaf mould and rotted manure, is a good compost for them. Liberal drainage with copious supplies of water when the plants are established is the best treatment. Slugs have been troublesome amongst the Orchids they are most readily destroyed by looking for them with a light at night when they will be out feeding. In the greenhouse little has been done, except tying and training plants. Hyacinths throwing-up flower trusses have sticks placed to them before there is any danger of the spikes falling over and snapping at the base.

Stage Pelargoniums in small pots are quite ready to be repotted, and will be attended to as soon as we can spare time. Those plants intended for early flowering should be potted at once. Plants that were cut down late in the season and intended to flower into July, may be repotted late in February or early in March. Look carefully after Cyclamens. If the plants are large there is some danger of both flower and leaf stalks being damaged through mould. Any decaying matter should be removed. See that all plants removed to the conservatory from forcing houses are not exposed to too sudden changes of temperature, and let them not be placed in draughts.

#### FLOWER GARDEN AND SHRUBBERY.

In this department all fallen leaves should have been removed, dead and decaying parts cut from trees and shrubs, and planting finished. Specimens that have just been planted should be mulched with rotten manure, and supports put to them to prevent the wind from loosening the roots. Turf whereon there are inequalities should be relaid at once; the turf must be cut and rolled back, and the inequalities filled-up with fine soil. We have begun to prune the Roses. They are now bursting into leaf; and allowing the growths to progress as they are, will only serve to weaken the plants. Hyacinths and Tulips are through the ground. Snowdrops are in flower, and Crocuses will open in a few days. Wheeling-on rotted manure to the flower borders and digging them.—J. DOUGLAS.

### TO CORRESPONDENTS.

N.B.—Many questions must remain unanswered until next week.

PERSONALITIES.—A *Well-wisher* has written to say that "very severe strictures" on THE JOURNAL OF HORTICULTURE have appeared two weeks following in an Irish gardening contemporary. We are not curious to know what these strictures are. We care only for the good opinion of our readers, whose appreciation of the Journal has raised it to a position unprecedented in circulation among gardening periodicals, and what our Irish contemporary thinks of us is a matter of pure indifference. There are only two objects he can have in making these strictures, the one to benefit himself, and the other to elevate horticulture in Ireland, and if he thinks he is doing either or both let him indulge himself; but from what we know of the high-class gardeners of Ireland they will not be complimented by being furnished with a tirade of trash which would not be tolerated in any gardening publication on this side of the Channel. Our large and increasing circulation in Ireland may afford a clue to our contemporary's strictures.

SINGLE WHITE PRIMROSES (G. C.).—If you will send your address to Mr. Robson, of Linton Park, Maidstone, he will put you in the way of obtaining what you want.

EVERGREEN FLOWERING SHRUBS FOR A SMALL LAWN (*Topsey*).—For a lawn, in an exposed situation, 72 feet by 38, we would not have the shrubs dispersed either singly or in small groups over the entire surface, but confine them to two or three small detached clumps at each end, and to a circular bed, 18 feet in diameter, in the centre of the lawn, filling the circle with a selection that would possess much of beauty and interest during the greater part of the year. Such a circle would require about thirty plants. A dozen Rhododendrons might be grouped in the centre, surrounding them with a broad fringe of the choicest dwarf-growing evergreen flowering and berry-bearing shrubs. Of Rhododendrons, choose Mrs. John Clutton, John Waterer, Fleur de Marie, Old Port, Mrs. R. S. Holford, Purity, Charles Dickens, Minnie, Duc de Brabant, Alarm, Mrs. G. H. W. Henage, and Elfrida; and of other shrubs, Berberis Darwinii, Berberis stenophylla, Erica mediterranea, Ligustrum japonicum, Kalmia latifolia, Ledum latifolium, Persea angustifolia, Persea mucronata, Skimmia japonica, Andromeda floribunda, Mahoeia Aquifolium, Rhododendron ferrugineum, Menziesia polifolia, Menziesia polifolia alba, Cotoneaster Simonsii, Erica australis, E. laeocata, and E. Alportii. For the end clumps choose Spartium junceum (Yellow Spanish Broom), Cytisus albus (White Broom of Portugal), Ulex europaea flore-pleno, Berberis japonica, Arbutus Rollissonii, and a few Rhododendrons.

SELECT CARNATIONS (E. F. Richardson).—*Scarlet Bizarres*: Admiral Curzon, Lord Lewisham, Sir J. Paxton, William Pitt, Guardsman, Mars, *Crimson Bizarres*: Isaac Wilkinson, Eccentric Jack, Graceless Tom, Jenny Lind, Lord Raglan, Rideman, The Lamplighter. *Pink and Purple Bizarres*: Falconbridge, Purity. *Purple Flakes*: Ascendant, Dr. Foster, Earl of Stamford, Mayor of Nottingham, True Blue. *Scarlet Flakes*: Christopher Sly, Cradley Pet, Justice Shallow, Mr. Battersby, Superb. *Rose Flakes*: Mrs. Frederic Burnaby, Sybil, George Tugwell, James Merryweather, John Keet.

SELECT PICOTEES (*Idem*).—*Red-edged*: Bertie, Eugenie, Mrs. Horoby, Miss Small, Mrs. Keynes, Princess of Wales, Sylvia, Mrs. Little, Exhibition, Forester, Lord Valencia, Mrs. Norman. *Purple-edged*: Ethel, Alliance, Chentleer, Edith, Medina, Norfolk Beauty, Admiration, Amy Robsart, Cynthia, Frances, Jessie, Mabel, Mary. *Rose and Scarlet-edged*: Edith Dombain, Juliana, Mrs. Fordham, Gem of Roses, Mrs. Fisher, Obadiah. *Yellow ground*: Canary, Claude, Gold Button, Jupiter, Seraph, Sovereign. "Florists' Flowers," which you can have free by post from our office for 5d., treats on the culture.

TUBS FOR STOVE CLIMBERS (F. F., Dublin).—It would answer to have slate tubs or boxes for the growing of the climbers, but we should have a border over the hot-water pipes, and it seems you have at present one 3 feet wide and 3½ feet high or deep. We presume it has a wall forming the bed; if not, we should build a wall a brick thick 3 inches higher than the hot-water pipes, and a ½-inch wall against the back wall to the same height, and have flags or slates reaching from wall to wall to form the bottom of the border. Your pipes will therefore be in a chamber beneath, and this being open at one or both ends, the roots of the climbers will be benefited by the heat from the pipes. We should then carry up the wall outside ½ inches thick, the lower course pigeon-holed, and the top course laid in cement, and capped with the same, so as to resemble a rounded curbstone, which will give a neat appearance and stability to the work. The brickwork should be taken across the ends, should not be less than 2 feet high, and need not be more than 2 feet 6 inches. At the bottom, 6 inches of rubble will be needed for drainage, and a layer of turves over it, so as to keep the drainage free. The border should be filled high with soil to allow for settling, and it is well to divide it crosswise, so as to confine the roots of each climber to their proper limits. *Passiflora quadrangularis* may be one of the climbers, but it would also of itself occupy the wall of a large house. *P. Decaisniana* is larger-flowered and scented, and gives as fine a back wall, but have them planted so as to train on the rafters of the house. *Euphorbia jacinthiflora* answers well, also *Allamandas*, but the finest of subjects for the back wall of a stove is the very beautiful-leaved *Cissus discolor*. For the roof have *Passiflora principis*.

SHADING CUCUMBER HOUSE (W. S.).—The best material is tiffany, and fixed to a roller, so as to move up and down at pleasure. They are liable to be moved and torn by wind, but that may be prevented by having linen tape sewn up each edge, and if the roller is properly secured it cannot be moved

by the wind. As to breakage of glass, we have not had anything to complain of. There are blinds made of strips of wood woven together, named pineolium, or tropical revolving blinds, which are very neat, especially those painted green. The price varies according to quality. The green-painted are about 5d. per square foot, which is more than nine times the price of a shading material which we consider more suitable. The pineolium may be had through any of the principal nurserymen advertising in our columns.

**COMPOST FOR PLANTS (F. P. A. C.).**—For *Stephanotis floribunda* two parts sandy fibrous peat, one part each light fibrous loam and leaf soil, with one-sixth of silver sand. For *Hoya carnosa* equal parts sandy fibrous peat, fibrous light loam, old cow dung, charcoal in lumps from the size of a pea to that of a walnut, broken bricks, and old lime rubbish, well mixed. For *Begonias*, fibrous loam two parts, leaf soil one part, half a part of sandy peat, and a sixth of silver sand, with a few pieces of charcoal. For *Achilleas*, light fibrous loam and sandy peat in equal parts, one-fourth leaf soil, and a sixth each of silver or sharp sand and pieces of charcoal. *Lycopodiums* and *Maiden-hair Ferns* succeed in a compost of three parts sandy fibrous peat, one part yellow loam, and one part, in equal proportions, of sandstone broken to the size of a hazel nut, silver sand, and charcoal, the peat and loam broken-up small, but not sifted, except for small plants, and the whole well mixed.

**THRIPS ON AZALEA (Thomas).**—The sprigs of Azalea are infested with thrips, and the other plants are, no doubt, attacked by the same insects. The best remedy is to fumigate with tobacco. Choose a calm evening, shut-up the house closely when the leaves are dry, and fill it with tobacco smoke. Repeat the fumigation the next night but one, and the following day syringe the plants thoroughly, especially the Azaleas, on the under sides of the leaves. It will be necessary to examine the plants frequently, and when you find any thrips fumigate the house at once. The insect may be kept under by frequent sprinklings of water and forcible syringings on the under sides of the leaves during growth. We do not recognise the sprig of plant sent us. Plants sent to name should be good specimens and in flower. In repotting *Ferns* it is not necessary to plunge them in bottom heat.

**FORCING POTATOES (Q. S. P.).**—For a frame 12 feet by 6 feet four barrowfuls of thoroughly rotted manure will be sufficient. It should be mixed with the soil, which ought not to be less than 10 inches deep, the Potato sets being planted 4 inches deep; but if we understand you aright, you want to know what depth of fermenting dung to place under the soil. It should not be less than 3 feet, and the bed ought to be somewhat higher to allow for settling. The Potatoes should not be planted until the bed has a temperature at 10 inches deep of 75°, not more. The temperature of the frame may be 50° to 55° at night, and 65° to 75° by day, and the amount of air to be given is dependant on the weather. In fine mild weather too much cannot be given; and though we grow them in the above temperatures in houses in frames, we keep them quite cool, being careful only to save them from frost. Myatt's Prolific Ashleaf, or Veitch's Improved Ashleaf, is good.

**COMPOST HEAP TURNING (J. P.).**—The mud you have taken from the pond so recently as December, and placed in alternate layers with lime, we should at once turn over if this can be done without converting it into a muddy mortar-like mass, and whilst the lime is quick, so as to incorporate it with the soil; but if it be very wet, and the compost in turning forms a soapy mass, leave it as it is until it becomes dry, then turn it, and next autumn turn it again, adding more lime. Left until spring it will be in good condition to apply to the land.

**VINE BORDER INSIDE HOUSE (W. Y.).**—There is nothing to hinder your forming the border inside the house. It should be properly drained, and be not less than 2 feet 6 inches deep, clear of the drainage, which ought to be 6 inches deep, better 9 inches, and have drains to take away superfluous water. The border will do on the north side of the house, and the Vines may be planted on that side, training them up the rafters to the other side. We should, as you have plants in the house, have the Vines planted 3 feet 6 inches or 4 feet apart, and take them directly across the house. The shade they will give in summer would be beneficial rather than injurious, and in winter the Vines will be leafless. It will hardly be doing the Vines justice to train them to the north side of the house only; and notwithstanding the credit you would have from having nice flowers, you will find Grapes will afford greater satisfaction to your employers. A Peach tree would not thrive satisfactorily on the north wall. The glass you sent us, which is mill-ribbed glass, will answer for a house for Peaches or Vines.

**MANURING VINE BORDER (Toen Gardener).**—Good turfy loam and horse droppings without straw equal parts, well mixed, the loam chopped-up fine, and to every six bushels or barrowfuls add a bushel of half-inch bones and the same quantity of soot, placing it on the border, after slightly loosening the surface, about an inch thick. It is suitable alike for inside or outside Vine borders.

**PREVENTING GOOSEBERRY CATERpillARS (Idem).**—Cover the ground all round the bushes when the buds begin to swell with fresh tan from the tanyard 2 or 3 inches thick, placing it up to the stem and as far as the branches extend, or 2 or 3 feet from the stem all round. Let it remain throughout the summer, and in autumn dig it in.

**ORCHIDS IN VINERY (Idem).**—There are a number of Orchids that will succeed in a vinery, but we should advise you to cultivate those adapted for cool treatment. Their cultivation is not difficult, but an amateur would do well to provide himself with a work on Orchid treatment.

**PROPORTIONS FOR A VINE-BORDER COMPOST (A. K.).**—To a cartload of turf, which is a vague term, you may add three bushels of half-inch bones, and the same quantity of charcoal. For the early house we should have Black Hamburg, Mill Hill Hamburg, Buckland Sweetwater, Foster's White Seedling, and White Frontignan.

**ARAUCARIA IMBRICATA LOSING BRANCHES (J. C.).**—The most likely cause is the heavy clay soil with water lodging in the subsoil; or, owing to the elevated position, the lower branches may suffer from the strong current of air. It is, however, a common occurrence, and no remedy has been found, though various suggestions have been made from time to time both as to cause and prevention. Shelter, not necessarily of great high trees, but of hills planted on the slope, or shrubs, or even hedges, so as to prevent the wind from violently moving the branches to and fro, would be beneficial. Our *Araucarias* are all well furnished to the ground; they are sheltered all round by shrubs, but still open enough to allow room for growth.

**TREE CARNATIONS NOT FLOWERING (C. R. A.).**—Your cuttings put in last April, and which were stopped, have done very well to make bushy plants, and the reason they have not formed flower stems is the lateness of the striking and the stopping. Your placing them in a Cucumber house will cause them to grow very rapidly, and the flower stems will be weak and

spindling, and very likely the flower buds will be abortive. A temperature of 50° to 55° is sufficiently high for forcing Carnations successfully, the former being the minimum, and the latter the maximum, from fire heat. To flower Tree Carnations well in winter, a temperature of 50° at night from fire heat is necessary, and it is equally necessary that the plants be strong and well furnished by September, the pots being full of healthy roots. We have now old plants flowering in a greenhouse, and we find they open their flowers more freely in a low temperature than young plants. Our young plants, struck about the same time as yours, will not flower until May, and that is earlier than yours will do if you remove them to a greenhouse, which we advise, placing them in a light airy position.

**EARLY PEAS (W. M. P.).**—We quite agree with you in opinion of the firm you mention; but if we inserted your note we should have half a dozen others from friends of other seedsmen.

**MISTLETOE PROPAGATION (B. G.).**—The seeds were probably taken by birds. We advise you to try again, from the present time to the end of March inclusive being the best season for sowing the berries. This may be done by making two cuts on the under side of the branch of an Apple, Crab, Thorn, or Lime tree in the shape of a V, the cuts being made through the bark quite to the wood; raising the tongue of bark made by the cuts, taking care not to break it, squeeze from the berries one or two seeds neatly under the bark, and let the tongue back into its place; the operation is then complete. We have had them grow freely by squeezing the seeds from the berries on a smooth part of the bark on the under side of the branches, the seeds adhering to the branches by the glutinous matter. You may also graft early in May, making an incision in the bark of the tree, and inserting into it a thin slice of Mistletoe with a bud and leaf or leaves at the end; or you may put in larger pieces of Mistletoe, taking a piece of wood from the tree, so as to correspond with the graft, the latter being prepared as in notch-grafting—with this difference, that for the Mistletoe an incision is made below the notch, as in crown-grafting, to receive the scion, a shoulder being left on the scion to rest on the notch made in the stock. Budding may be performed from the beginning to the middle of May, the buds being put in with the wood, a short heel of wood being retained below the bud for insertion.

**FELT COVERING ON VINE BORDER (Idem).**—The felt covering will not do the border the least harm, nor deprive it of the sun more than coverings of stable litter, leaves, or wooden shutters, and will throw off rain and retain warmth. We should only remove it on fine bright days, replacing it at night before May, the border being in a proper state as to moisture.

**WATER RAM.—"A. D." wants information as follows:—Given a piece of ground, of an elevation lower than the house, which contains springs, must you tap a spring and create an artificial stream in order to work the ram, or can you do it by sinking a well and attaching the ram to that? If a stream is necessary, then what fall is required?**

**THE OXION PLANT (A Working Lady).**—We are informed that this plant (see p. 86) is *Scilla (Urginea) maritima*, which is often grown under that name in cottage windows.

**STOVE PLANTS (F. T.).**—We will consider your suggestion; but the myriads are overwhelming.

**CHAPEMAN'S PACKING BOXES (J. S.).**—We do not know the present address of the maker.

**POULTRY MANURE (H. M.).**—Any gardener in your neighbourhood ought to be well pleased to fetch it, as you offer it gratis. If you inform us of your full direction we probably could aid you.

**PLANTING PEAR TREES (G. W.).**—Pear trees worked on the Quince stock should be planted so that the union of the stock with the scion may be level with the surface of the soil. Those worked on the Pear should not be planted deeper than they were when growing in the nursery.

**GRAFTING COTONEASTER (Idem).**—It may be grafted as you purpose. We have been perfectly successful in grafting evergreens by performing the operation just before they start into growth in the spring.

**CHAUMONTEL PEARS BITTER (G. G. K.).**—Our Pears of this sort from pot trees were excellent, but we could only obtain fruit fit to eat in very warm seasons from standard trees out of doors. Last season was not a good one for ripening Pears, and the only remedy is to grow the finer sorts in orchard houses or on warm walls. Perhaps your fruit will do for baking.

**VINES PLANTED LAST AUTUMN (An Ignoramus).**—It is right to rub-off all the eyes, except two as near the base of the plant as possible. But it is also as well (unless you wish to have a great number of sorts) to allow two canes to grow from each plant. In that case the Vines may be planted 5 feet 6 inches apart. The best Vines are those one year from the bud. You evidently have bought some fruiting canes; they would bear fruit during the ensuing summer, and could afterwards be cut-out, letting the others supply their place.

**NEGLECTED PEACH TREES (Idem).**—It would be most satisfactory to purchase young trees to plant on the wall of your orchard house.

**CRUSHING BONES—DAPHNE REPOTTING (J. F. C.).**—We do not know of a better plan than to place them on a hard substance and crush them with a hammer. A bone mill is of course far preferable, but we do not know of a small inexpensive machine for crushing bones. It would be well to repot the *Daphne indica rubra*, removing any loose soil, or that which can be readily taken away without injury to the roots, and do not give a large shift. An 8-inch or 10-inch pot would not be too large for the size of plant you describe, unless you reduce the ball considerably, when it would be well to return it to the same sized pot, or one a trifle larger. As the plant has not flowered, you may pot it in March, or at once if it is beginning to grow. The *Cytisuses* and *Azaleas* should not be potted until after flowering, and then into a larger size of pot, merely removing any loose soil and loosening the sides of the ball. If young plants they may be potted in March.

**LOCHERIA MAGNIFICA (W. F. H.).**—*Locheria* is a sub-genus of *Achimenes*, and requires similar treatment—that is, to be duly supplied with moisture and heat whilst growing, keeping it rather dry after flowering, but not drying off as with other kinds.

**RUSSELLIA JUNEAE TREATMENT (Idem).**—Do not cut it down, but allow the shoots coming from the root to grow up, repotting now, and giving a compost of sandy peat and loam in equal parts, with a fourth part of leaf soil, a sixth of silver sand, and a few pieces of charcoal and good drainage. It requires to be grown in a stove, to be well supplied with water and moisture when making fresh growths, and when these are completed keep it from flagging and in a light airy position.

**FORMING BUSHY CINERARIAS (F. H.).**—To form bushy plants stop them at the third leaf when the stems are being thrown up. This will cause them

to branch, and the stopping may be again practised when the shoots resulting from the first stopping have made two leaves. This will make your plants very bushy, the shoots being regulated by neat stakes so as to form a compact head. It is now too late to stop your plants, but you may by timely attention have them bushy another season.

**ZONAL PELARGONIUM CULTURE (A. R.).**—Your plants ought now to be kept rather dry, but not so as to cause them to shrivel; and at the end of February they should be pruned, which we should confine to the shortening or cutting-out of irregular growths; and the branches ought to be pegged down or taken out so as to secure the breaking of the plant regularly. Place them in a light airy position, and keep them moderately moist. When the plants have broken turn them out of the pots, remove as much of the old soil as comes away without bringing off a great many of the roots, and return to the same size of pot as before. Shade from bright sun, and sprinkle overhead twice daily till they have recovered from the potting; water sparingly, only keeping the soil moist until the roots are working freely in the fresh soil, then water more freely, and expose fully to light and air, but shade from very bright sun for an hour in the hottest part of the day. When the pots are filled with roots, or early in May, the plants may be shifted into their blooming pots, after which they would be best grown in a cold pit, or light airy position in a cool house. Strong irregular growths may be stopped, but not after the middle of May, else any trusses of bloom as they show up to that time. Train the shoots out, so as to form a compact well-furnished specimen. Weak liquid manure may be applied, after the pots fill with roots, at every alternate watering.

**ESPALEIR APPLE TREE WIRES (Welly).**—The distance of the wires or trainers apart should be 1 foot, the first being fixed 14 or 15 inches from the ground. Five or six wires will be a good height for espaliers.

**CAMELIAS FOR CONSERVATORY WALL (H. B.).**—Monarch and Mathotiana alba are not "trailing" Camellias, nor are there any that are of that habit, but they are free-growing kinds, and in a good border and when established make shoots of about a foot a year, sometimes less; so that a plant if planted quite young would be a number of years in reaching the top of a wall 4 yards high; but plants of a good size ready trained for walls may be had, or a one-sided large plant may be used for the purpose.

**THORN TREE GRAFTING (Alice).**—Cut-off the head when the buds are showing the green of the leaves, which will be some time in March or early in April, and after paring the sawn part smooth put in the scion by crown grafting; or we should, on such large arms, put in two scions by cleft, and other two on the same arm by crown grafting. If the grafts grow you will, of course, remove all the shoots arising from the stock; but if they do not, encourage three or four shoots, the strongest on each arm, and those you may bud in July; and if the buds do not take you can graft the shoots the following March, putting on the scions by tongue or whip grafting.

**MESEMBRYANTHEMUM CORDIFOLIUM VARIOBATUM SOWING (Idem).**—The seed should be sown in light sandy soil, which should be watered before sowing, allowed to stand for a few hours and again watered, and when settled sow the seed, covering it very lightly with fine soil or silver sand. Place in a cucumber frame or hotbed and near the glass, and when the seedlings appear remove at once to a light and airy position in the warm greenhouse; do not water overhead but through the spout of the watering-pot, pouring the water on a piece of crock or slate that may be placed in the pot amongst the seedlings. Very little water is required whilst they are young, or indeed at any state; all they require is to be kept from becoming limp. Pot-off singly when they are large enough to handle.

**PIRUS JAPONICA ROOT CUTTINGS (Idem).**—The cuttings of the roots ought to be put in now in light sandy soil in a warm situation, covering them about 2 inches deep, or they may be inserted in pots and placed in a gentle heat.

**CROTON VARIOBATUM CULTURE (Idem).**—It is a stove plant, but will succeed in a warm greenhouse, keeping rather dry in winter. Repot in spring when it begins to grow, removing any loose soil, and what can be picked from amongst the roots without injury to them, and repot in a size of pot that will admit of an inch of soil all around the ball, keeping the setting-on of the roots level with the rim of the pot. Equal parts fibrous peat and loam, with a fourth part leaf soil and a sixth part silver sand, a few nodules of charcoal, the whole well mixed, will grow this plant well, good drainage being given. Water freely during growth, and keep moist, and in winter keep rather dry, yet so moist as to maintain the foliage fresh. To have the foliage well coloured the plant should have a light position. In shade it is very badly coloured.

**POINCIANA REGIA CULTURE (H. G.).**—It will not succeed in a greenhouse, but requires a stove. It is not much cultivated in England, not being in any catalogue of plants that we remember. We do not know more than the species, and the variety to which you allude is probably the species *P. pulcherrima*, scarlet and yellow. *Ormosia coccinea* is not in cultivation in this country, neither of it nor of *Lithospermum* do we know where seeds may be obtained. It would not pay seedsmen to deal in plant seeds not generally in demand.

**POTATOES (G. W. Drake).**—They do not produce the wax moth. Sprig-planted Potatoes should be dug-up as soon as the leaves begin to turn yellow. Bone dust and sulphate of magnesia mixed are a good artificial manure for Potatoes.

**RUSTIC SUMMER HOUSES (A Subscriber).**—Apply to Mr. Caven Fox, Royal Horticultural Society's Offices, South Kensington.

**INSECTS ON VINE SHOOTS (Amateur).**—The minute red insects assembled round the buds and base of the shoots of your Vines are, we regret to say, the *Acarus*, commonly called the red spider, so injurious in green and hot houses. You will observe that they have spun a little layer of silk, on which they are grouped. You must wash the Vines with a thick coating of lime, soft soap suds, soot, and some size or gummy material to make the mixture adhere to the shoots. This plan will also protect your trees from the Vine Oidium.—I. O. W.

**NAMING FRUITS (A. D. Preston, and others).**—Our best authority is abroad, when he returns all will be named.

**NAMES OF PLANTS (C. W.).**—*Tassilago fragrans* (Sweet-scented Coltsfoot). Although a native of Italy, and deliciously scented, it was unnoticed by botanists until M. Villan, of Grenoble, was attracted to it by its perfume at the foot of Mount Pilat in Italy. It was introduced into England in 1806. (*J. Wilson*).—*Euonymus europæus*, the "Spindle Tree," and *Peziza coccinea*. (*Highfield*).—Your Orchid was unfortunately undeterminable. Can you send again? (*Elizabeth W.*).—*Spiraea arizifolia*. (*Sub.*).—1, *Gesnera elongata*, or a very close ally; 2, we cannot say; send when in flower; 3, Perhaps *Ancylogyne*; when leaves and isolated flowers only are sent some indication of

mode of growth should be given. (*J. R.*).—*Lapageria rosea*. (*S. D.*).—*Bryum argenteum*. (*G. W.*).—*Genista fragrans*. (*E. A. H. C.*).—*Chimonanthus fragrans*.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### POULTRY-MARKER.

HAVING frequently seen inquiries made by your correspondents as to the best mode of marking poultry, I enclose you a marker of my own invention, which I have used all through the past season with entire satisfaction. It can be put on or taken

off with the greatest ease by using two pairs of ordinary round-pointed wire pliers. It is made by letting fall one or more drops of melted solder on to a piece of stoutish copper wire. The solder is then stamped with a number by means of a die, and a corresponding number entered in the poultry-book. The size and number of the drops of solder, and likewise the thickness of the copper

wire, can be varied at pleasure to suit the size of the chicken or fowl, and any ironmonger will furnish a set of number-dies of the requisite size at a trifling cost.

This plan may possibly be already known, but I have never seen anything at all like it, and as it has been most useful to me I wish to make it known to my brother fanciers through the medium of your columns. I may add that I prefer two drops of solder in case of the accidental defacing or loss of one.

I do not find my marker incommodes the birds in the least, nor does it chafe or injure the feathering or colour of the legs of Brahmas or Cochins.—WILLIAM SAVILE, *Withersden Hall, Wye.*

### THE BRISTOL SHOW SEEN UNDER SUNLIGHT.

THE Bristol Poultry and Pigeon Show has now, somewhat like the city from which it takes its name, grown venerable. When a Committee have persevered amid great difficulties for eight years in endeavouring to maintain amongst them a first-class Show, they are entitled, like their birds, to be "highly commended." Shows—aye, many—have been started and come to an end since the first of the Bristol exhibitions, but that has gone on. Bad weather and Bristol Show time have almost always gone together. This is discouraging: still more is apathy shown to poultry matters by Bristolians in general—this is very unpardonable. The fine Rifle Drill Hall stands full in view on the highway between Bristol and Clifton; it is not hidden up in a corner. Every Bristol man of business who has his Clifton villa passes it, and he does keep, or ought to keep, poultry; but he does not enter the Show. Ladies in shoals bound for shopping expeditions sail by gorgeously appraised, and the spacious hall would admit them and not crush or damage their dresses; but they do not enter. Young ladies and young gentlemen on flirting expeditions pass by—very remiss in them; for at a show where the gangways and corners are many, flirting can be carried on, and snarly sentiment can be suitably indulged in, and even proposals made, in the kindred and contagious atmosphere of a Pigeon Show. Young ladies and gentlemen, you who read this will, I am sure, be present next year. But jocularly apart, it is too bad that the Show should be so neglected by Bristolians. I would suggest that Canaries and other cage birds and talking birds be shown with the poultry next year: I think they would draw. I have a crow to pluck with the Hamburg breeders. They were very liberally dealt with, but did not give that support which they ought to have given. Still, with every deduction the Show was a first-class one—not quite so many pens as last year, but quality made up for quantity.

Friday, the opening day, was terribly wet and windy, and I could not face the weather, but waited in hope for a fine day on Saturday: nor was I disappointed. Sunlight the railway journey through; sunlight on the pretty country between Bath and Bristol; sunlight on the old houses in the narrow old streets of Bristol; sunlight on St. Mary Redcliffe, and that fine towered old church near Corn Street; sunlight on the Avon; sunlight on College Green and the old Cathedral; and bright sunlight outside the Rifle Drill Hall, and the inside lit up by the bright thin yellow sunlight that comes after rain. N.B.—A new town seems to me like a bit of the country spoiled, but an ancient historic place like Bristol is always, in all weathers, interesting. It has stood so long, and around it have clustered so many memories as a town, that its having been once country is quite forgotten. Thus it is that a city must be venerable in order to be interesting.

But to my immediate duty. In this corner yonder is class 1. *Dorkings*, Coloured (chickens).—Twenty cockerels made their appearance but excepting the first-prize none were noteworthy. The pullets were much better though fewer; first and cup excellent, and the other prize and highly commended and commended

birds worthy. Dorkings (Coloured) over one year.—Again the hens were the best in my opinion, though a cock took the cup. The first hens, Mr. Patton's, were pattern birds. Dorkings (Silver-Grey).—Only four cocks and only one prize awarded, but Mr. O. Cresswell's bird deserved what it got—a first; the rest nowhere. The hens again were the best. (N.B.—Why will not breeders keep up the beautiful Silver-Greys, birds far more beautiful but not so heavy as the Dark?)

*Cochins* (Cinnamon and Buff), chickens.—Cockerels, twenty-one, pullets but ten, but again the latter were the best. (N.B.—This is a day of lady-superiority evidently.) The first-prize cockerel, however, was every whit a Cochin; the third too small. First-prize pullets, handsome birds; second, the plumage too mottled; third, small but nicely feathered, but one comb was twisted. In pen 98, Miss Milward's, one of the pullets was a beauty. *Cochins* (Cinnamon and Buff), cocks, old.—These were among the best cocks of the Show. First and cup, Lady Gwydyr's, was no doubt the best Cochin in the whole Show. Second sold for six guineas, and very cheap. *Cochins* (Cinnamon and Buff), hens, old.—First one an excellent shape; second good shape but mottled plumage. *Cochins* (Brown and Partridge), any age.—Good classes both cocks and hens, but the latter the better; six pens were deservedly noticed out of the eleven. Next *Cochins* (White).—Both cocks and hens were a sight to delight a fancier. They are a greatly improved and improving class. Cocks—first-prize, lovely; second, good; third, hardly fit for his place, not so good a bird as No. 150, which, but that it is too yellow, is excellent as a Cochin. Pullets or hens—first, beautiful; second, better in comb than the first. No. 165, highly commended, very nice.

The Dark *Brahmas* were exceedingly numerous, so numerous that I own, as they were so nearly alike in excellence—great praise this—one almost wearied of them. Mr. L. Wright's cup pullets were, of course, very superior, but, indeed, all the Dark *Brahma* classes were wonderfully good. The Light *Brahmas*—fowls for use and ornament in grass-land in the country—were in the cocks good, but some weeds among them, and more among the hens. First and cup pullets very worthy. First and cup old cock stupendous in size.

*Spanish*.—Now these are the Bristol speciality, and claim, therefore, special notice. First, cockerels of 1873.—This entry was as good as any former year. First and cup, Mr. E. Jones, this bird has a lovely face, lying smooth in surface and rounded in form below; second not flat-faced enough to please me; third a better comb than first. No. 392, highly commended, but wry-tailed; No. 400, highly commended, not so good as No. 399 only commended; No. 407, rough cauliflower face. Pullets—very small entry and hardly up to the mark, but first and cup charming birds; second, one very good bird; third, middling only. 416, highly commended, one very good. *Spanish*, cocks, any age.—First, too rough a face; second, good and a beautiful comb. Hens, any age.—First, much the best; third was, I believe, the first last-year's pullet. No. 432 a fine old hen.

*Hamburgs* (Gold-spangled).—Few and good. There should have been more entries considering the encouragement offered. *Silver-spangled*, cocks.—First, an admirable bird, well shown; third, a very neat bird. The *Silver-spangled* hens, a very good class, all but one noticed. *Hamburgs* (Gold-pencilled).—More numerous. First, cock, first-rate. *Hamburgs*, cocks (Silver-pencilled).—Very few and poor. First prize withheld. Hens—better. Black *Hamburgs* pressing forward well. First, cock, just the thing. Hens—a good class; first, second, and third all good, and the highly commended good also. The Black *Hamburgs* are so much more *Hamburgs* and so much less *Spanish* than in earlier years.

In regard to the *Game*, which come next, there was some dissatisfaction among *Game* breeders, because the Black-breasted Reds and the Brown-breasted were shown in the same class, and this was felt the more as all three prizes went to Brown Reds. First and cup, a thorough good Brown Red cock; second, good; third, out of condition. Among *Game* pullets third was a good style and colour; second, a good hen. No. 563, Mr. Stag's highly commended, the best pullet in the Show, but hatched rather late. *Game* (Any other variety), cocks.—First, a good but odd-eyed Duckwing cock; third, a good Pile. On the whole the Duckwings not very good. *Game* (Any other variety), hens.—First and cup, a beautiful bird, almost faultless; second, Duckwing, better if longer, but colour good; third, a good Pile.

*Malays*.—Twenty-three entries in all. Cocks—first, a very large bird; third, remarkably good plumage. The hens were most liberally noticed by the Judges, but struck me as wanting in size, except the prize birds. The *Malays* are wonderfully like *Vultures* as one sees them in the pens, specially the hens. But this remarkable look points them out from all other fowls as a thoroughly distinct variety and one worth keeping up.

*Polish* (Any variety), cocks.—First, Golden; second, Silver; third, Black. Would there were more Blacks, as they are the original Polish, and after all, perhaps, the handsomest. Pen No. 647 contained a cock and hen by mistake, but very good.

*Polish* (Any variety), hens.—First, Golden and good; second, a good Silver.

*French* fowls appear, by their number, to have a good hold on the public favour.

Any other distinct variety, cocks.—First, a good Black Cochin cock, and truly glad was I to see him. There were Sultans, Leghorns, Andalusians, Frieslands, White Dorkings, &c., and very good and interesting almost all of them. Among the hens the first prize went to an excellent pair of Black Cochins. The whole class was a good one. Everyone noticed the hybrid Pheasant and *Brahma*, No. 726. The Pheasant was most visible in the bird, but the booted legs proclaimed the *Brahma* cross.

Among the *Ducks* the Rouen were particularly good; and in the little East Indians, which were a capital lot, Mr. Sainsbury's were first. There were also *Mandarins* and *Carolinas*, the prettiest of the pretty.

*Geese and Turkeys*.—Very few.

*Game Bantams* (Black-breasted and other Reds).—Not so numerous as usual. A Brown Red took third prize. *Game Bantams* (Any other variety).—First and cup, the hen rather large; third, a very excellent pen—the whole class a good one. *Black Bantams*.—First and cup, cock rather large; the second I preferred to the first; third, Mr. Cambridge's, were good. Indeed the little Blacks were a good lot, and I was pleased to see, as an old Black Bantam breeder, that they were numerous. The *Sebrights* are, in regard to the Silver, improving. The breeding Gold and Silver together made the latter so cream-coloured that the real Silver were seldom seen—now it is different. First and cup, beautiful Gold; second, good Silver. No. 834, commended, were nice and silvery in colour. I have good hope that we shall see again the delicate and beautifully coloured Silver *Sebright* in perfection. White *Bantams* were a little and poor class, and the first prize properly withheld. *Game Bantams* (Any variety, any age), cock birds, were on the other hand somewhat numerous and decidedly good, more than half of them being noticed in one way or the other. The first and cup bird was what a *Game Bantam* should be; second and third were also good, but not quite worth the price asked by the owner—£1000! I had hoped never again to see these ludicrous figures. £50 is more within the region of common sense, and would suffice to prevent a sale.

#### THE PIGEONS.

*Carriers*, cocks (Black or Dun, any age).—Ten entries, and many very good birds. Seldom have I seen a better class, or a larger proportion of superior birds to the number of entries. *Hen Carriers* of the same age and colours were also good. Some were chiefly wanting in age—no cause of regret, as their prize time is coming. *Blue Carriers* were again very good, which is saying a great deal; but it was hardly wise to offer prizes for Whites. There were three entries, and only one bird at all *Carrier*-like.

*Pouters*.—Among the cocks was a capital Black, which took the cup. N.B.—*Pouters* are getting more numerous at provincial shows. Glasgow influenced the Crystal Palace, and the Palace influences all other English shows. Blue, Black, and Yellow, in the order written, took prizes among the hens, the last a nice sprightly bird. I much long to see more and better Yellows at our English shows; we want some Dundee birds to come south.

The *Almond Tumblers* were very few, but sure to win. Hardly more in number were the other *Short-faces*, but as good. First-prize, a Black Mottle; second, a beautiful Red; one, and only one, Bald!

The foreign *Owls* were lovely; the English *Owls* very foreign-like. There were Mr. Fulton's grand-skulled *Barbs*, and three good *Trumpeters*; of *Jacobins* a respectable number and of respectable quality. The same may be said of the *Fantails*. The *Turbits* were still more numerous. The *Nuns* again were but few, while the *Dragoons* of all colours were quite a show. This is what I like to see—not merely three or four birds sure to win, but a large number of rising birds from rising fanciers. Such classes show spirit in fanciers. I like also to see that a fancier far away from London, like Mr. Bishop, of Dorchester, can take to a class and win against great names, even against the dreaded "Bob." I should like to see other fanciers as spirited, and not "cowed," as some are, by such exhibitors as Messrs. Fulton and Yardley. It is not like English pluck to act thus, and it would be more English-like to persevere. Here was Mr. Bishop ahead, and far ahead, though little "Bob's" good old blood-red Dragon fairly got a second. I want again to see, as at the Palace, some good old grizzle *Dragoons*.

*Antwerps*, *Short* and *Long-faced*, were strong classes. The Any other variety class was not as numerous as usual. This is a class in which lady fanciers might well compete, as they are specially fond of the pretty-feathered varieties.

Having now gone through all the classes of poultry and Pigeons I have only to say that good arrangement was the rule, as always at Bristol. There was Mr. Roué hard at work in his secretary's office, looking energetic even under the depressing influences of bad weather and too little support. There was Mr. Cambridge ready as ever to render assistance to me. Dear old Bristol!

after all the grandest historic place in the west of England, its show ought to be continued and ought to pay. A late lunch with a brother fancier at the Show (a brother parson too), and then a stroll stationwards. A pause, as always, at glorious St. Mary Redcliffe, now fully restored—where, indeed, I sat in one of the chairs at the extreme end of the building, and was lost in a dream-like reverie. The sun, shining through the reddish-tinted chancel windows, cast a rosy light over that part of the grand old church; while the pearly-white reredos below, upon which no rosy light fell, looked at the great distance like lace-work wrought by feminine fingers; and arch and painted window beyond, and arch and painted window still further beyond, made the church a very lengthened avenue of stone. I glance up at the muniment room and think of Chatterton, "the Marvellous Boy." I go out and look at his statue. I go on and am at the station. Bristol, thou art dirty, 'tis true—"pity 'tis, 'tis true;" but then thou hast a history. Thou art no mere mushroom manufacturing place.—WILTSHIRE RECTOR.

### KENDAL POULTRY SHOW.

This was held in the Albert Buildings on the 22nd inst. and following two days. There were nearly 600 entries. Subjoined is the list of awards:—

GEES.—1, J. Walker, Rochdale. 2, Capt. L. Anyon, Chorley. 3, R. W. Simpson, Kendal.

TURKEYS.—1, J. Walker. 2, T. E. Rawson, Thorpe, Halifax. 3, J. Thompson, Adlam Mill Beck, Kendal. 4, F. Statler, Carlisle. 5, Mrs. Ranthumell, Barmston, York. 6, J. Walker. 7, J. E. Gladstone, Kendal. 8, Broad Green, Liverpool. 9, W. Evans, Prescott. 10, Addison, Kendal. 11, Aylesbury. 12, Cap and 2, J. Walker. 13, T. P. Carver, Langthorpe. 14, Mrs. Wootton, Mapperley. 15, Black East Indian. 16, J. Walker. 17, G. S. Sainsbury, Devises. 18, Mrs. Wootton. 19, any other variety. 1 and 8, H. B. Smith, Broughton, Preston. 2, J. Walker. 3, H. B. Smith; M. Leno, Markyate Street.

DORINGS.—Coloured, except Silver-Grey.—Cock.—1 and 3, J. Walker. 2, D. G. G. Meade. 4, J. Harley, Windermer. 5, W. Rutledge, Tarbrough. 6, Mrs. Hind, Kendal. 7, Hens.—1, D. Gellatly. 2, L. Pilkington, Widnes. 3, W. Copple, Prescott. 4, J. Walker; J. White, Warlaby.

DORINGS.—Silver-Grey, or any other variety.—Cock.—1, C. P. Raines, Bridgebaugh, Striving. 2, W. W. Rutledge. 3, J. Cunningham, Tarbrough. 4, Dalbeattie. 5, Hens.—1, Hon. Mrs. Howard, Milnthorpe. 2, J. Cunningham. 3, W. W. Rutledge. 4, Hon. Mrs. Howard; R. Smalley, Lancaster.

SPANISH.—Black.—Cock.—1 and 2, H. Lacy, Hebden Bridge. 3, W. Swann, Hurst Head, Redington. 4, H. L. Longland, Kendal. 5, Hens.—1, H. Lacy. 2, T. F. Ansell, Cowley Mount, St. Helen's. 3, H. Wilkinson, Earby, Skipton. 4, C. J. Myers, Broughton-in-Furness.

COCCHIN-CHINA.—Cock.—1, W. Cartmel. 2, T. Stretch, Ormskirk. 3, H. Lacy. 4, J. Rigg, Ulverston. 5, Hens.—1, C. H. Lacy. 2, G. H. Procter, Durham. 3, W. Cartmel.

FRENCH.—Crested-Cur, Houdans, or La Fleche.—1, R. B. Wood, Uttoxeter. 2, C. J. Jackson. 3, W. Jackson, Bolton. 4, W. Jackson.

GAME.—Black Red.—Cock.—1, J. Fletcher, Stoneclough. 2, J. Brough, Carlisle. 3, D. Harley, Edinburgh. 4, T. E. Satterthwaite, Castle Howard. 5, Cockerel.—1, T. Mason, Lancaster. 2, D. Harley. 3, J. Fletcher. 4, T. E. Satterthwaite. 5, H. Sharpe, Bebside. 6, Hens.—1, N. J. Pope, Binglewade. 2, J. Fletcher. 3, C. H. Wolff, Altrincham.

GAME.—Brown-breasted Red.—Cock.—1, Miss M. J. Nelson, Cocksaw, Hexham. 2, C. W. Brierley, Holton, Manchester. 3, J. Fletcher. 4, G. Sutton, Boothham. 5, Cockerel.—1, W. Higgin, Ulverston. 2, D. Harley. 3, T. Burgess, Burley, M. Whitechurch. 4, C. W. Brierley. 5, Hens.—1, C. W. Brierley. 2, E. and F. Fenwick, Kirkby Lonsdale. 3 and 4, W. Boulton, Furness Abbey.

GAME.—Any other variety.—Cock.—1, C. W. Brierley. 2, F. Sales, Crowle. 3, H. H. Staveley, Driffield. 4, Hens.—1, C. H. Wolff. 2, C. Travis, Thurgoldon, Sheffield. 3, F. Sales. 4, E. Aykroyd, E. Woodburn, Ulverston.

SPANISH.—Black.—1, H. Wilkinson. 2, T. J. Harrison, Kendal. 3, O. Thompson, Kendal.

HAMBURGERS.—Golden-spangled.—Cup and 2, G. J. Duckworth, Chureh. 3, H. Beldon, Gostcock, Bingley. 4, W. A. Hyde, Ashton-under-Lyne; J. Buckley, Taunton, Ashton-under-Lyne. 5, Silver-spangled.—1, J. Fielding. 2, Ashton and Booth, Mottram. 3, H. Beldon. 4, W. R. Park, Melrose.

HAMBURGERS.—Golden-pencilled.—1, H. Beldon. 2, R. Dickson, Selkirk. 3, J. Anderson, Gillshead. 4, E. and W. Fenwick; R. Dickson. 5, Silver-pencilled.—1, W. J. Mann, Kendal. 2, H. Beldon. 3, J. Robinson, Garstang.

ANY OTHER VARIETY EXCEPT BANTAMS.—1 and 2, H. Beldon. 3, J. Robinson. 4, G. E. Sawdon, Sutton Cross Hill.

SELLING CLASSES.—1, T. H. Hine, Kendal (Cochins). 2, D. Menon, Bradford. 3, G. C. Wilson, Dalham Tower, Milnthorpe. 4, T. J. Harrison (Buff Cochins). 5, J. Fawcett, Wolverhampton (Rouens). 6, J. Walker; W. Cartmel (Rouens); E. K. Kemp, Milnthorpe (2); M. Redhead, Kendal (Rouens); E. Robinson, Howkell (Cochins); W. Jackson (Grey Dorings); Mrs. Glessall, Kirkby Lonsdale (Cochins); G. Bethel, Sedgewick; E. Pearson, Whitehaven.

GAME BANTAMS.—Black-breasted and other Reds.—Cock.—1, J. R. Fletcher, Stoneclough. 2, J. Winskill, Buraside. 3, E. Fearon. 4, Miss M. J. Nelson (2); W. F. Addie, Preston (2). 5, Hens.—1, J. R. Fletcher. 2, W. F. Addie. 3, W. F. Addie. 4, J. R. Fletcher.

GAME BANTAMS.—Any other variety.—Cock.—1, J. R. Fletcher. 2, W. Murray, Hexham. 3, W. F. Addie. 4, H. Sharpe, Rawtenstall; H. Sharpe. 5, Hens.—1, J. R. Fletcher. 2, G. W. Teasdale, Ulverston. 3, W. Murray. 4, J. Winskill.

BANTAMS.—Other than Game.—Black.—1, W. H. Robinson. 2, J. Walker. 3, W. Moore, Keighley. 4, W. H. Shackleton, Bradford; A. Jackson. 5, Any other variety.—1, J. Mayo. 2, J. Waller, Kendal. 3, H. Beldon. 4, M. Leno; E. Walton.

#### LOCAL CLASSES.

DORINGS.—Chickens.—Cup and 2, Mrs. Hind. 3 and 4, W. Rutledge. 5, A. W. R. Stothwell. 6, J. Moser, Kendal. 7, BARNIA POOTRA.—Chickens.—1, G. Cartmel. 2, G. W. Bramwell, Kendal. 3, G. Bethel.

COCCHIN-CHINA.—Chickens.—1, J. Hine. 2, G. Cartmel. 3, Mrs. Glessall. 4, T. J. Harrison; J. N. Stanton, Milnthorpe; Mrs. Glessall; J. Hine.

GAME.—Cockerel.—1, J. Barrow, Kendal. 2, T. Cartmel. 3, M. J. Graham, Kendal. 4, W. J. Wilson. 5, T. Newton. 6, J. Ranthumell. 7, G. C. Wilson. 8, T. Cartmel. 9, J. Ranthumell; G. C. Wilson.

GAME.—Brown-breasted.—1, 2, and 3, G. C. Wilson.

SPANISH.—Black.—Chickens.—1 and 2, T. J. Harrison. 3 and 4, C. R. Kay.

HAMBURGERS.—Chickens.—1 and 2, T. Stuart, Staveley. 3, C. Kershaw. 4, J. Roberts, Holme.

DUCKINGS.—1, G. Cartmel. 2, J. J. Waller. 3, W. Cartmel.

BANTAMS.—Chickens.—1, W. Atkinson, Kendal. 2, J. Winskill. 3, Mrs. Laycock. 4, Mrs. Winskill; B. Davis; T. E. Thompson, Lound.

#### PIGEONS.

CARRIER.—Single.—Plate. J. Thompson, Ringley. 2, H. Yardley, Birmingham. 3, E. C. Stretch; J. W. Towerson, Egremont.

POUTER OR CROPPER.—Single.—1, R. Blacklock, Sunderland. 2, J. & W. Towerson. 3, W. Jackson; J. Davy, Edinburgh.

ANTWERPS.—1, W. Gamon, Chester. 2, C. F. Copeman, Birmingham. 3, H. Yardley; W. Gamon. 4, J. Wilson, Richmond.

TUMBLERS.—1, J. Fielding, Jun. 2, H. Yardley.

JUDGES.—Mr. R. Teebay, and Mr. J. Douglas.

### DORKING POULTRY SHOW.

It has not often, if ever before this year, been my fate to be in the neighbourhood of Dorking at the time of the poultry Show. When, then, the opportunity offered, I thought I would at all events make an effort to attend, for at Dorking you of course expect to see something corresponding to and worthy of the name. As the Show is not a new one, and in the centre of the district which is supposed to supply London with the best table fowls, I was inclined to hope for great things; but before the day was over I was reminded more than once of the saying which is said to be somewhere, though where I am not quite prepared to say—"Blessed are they that expect little, for they shall not be disappointed."

Looking at the schedule to ascertain when the Show would be open, I was unable to ascertain the point, nor could I see anything about the price of admission. A friend, however, on the spot, wrote me word that he thought it would be open at nine o'clock on the 22nd. I thought, therefore, I should be in time if I were there on that morning; but on inquiry learnt that some fortunate individuals had been admitted on the previous (Wednesday) evening. Allow me to suggest to the Committee that a definite hour for opening and a definite rule as to admission would be advisable in every way. Moreover, no time was fixed for claiming birds, so some claimed on Wednesday evening, to the chagrin of those who thought they were in time on Thursday morning. It is only right to say that when a complaint on this score was made, the Secretary at once endeavoured to do justice to all parties in the most obliging way. Still, it would be better if some time were allowed to elapse after the commencement of the Show before birds could be claimed, so that parties admitted to a private view or who have been able to attend at the opening of the Show may not have so great an advantage over others not equally favoured by fortune.

Starting almost before daylight on a cold and misty morning, I fear that I rather alarmed my friends, who seemed to think me a trifle crazed thus to venture forth for the sake of a few fowls; but as all men are said to be mad on some point, I am willing to plead guilty in this respect, and at the same time to acknowledge that my feathered friends have added greatly to the enjoyment of life, as well as lessened the wear and tear of a harassing occupation.

"*Dulce est desipere in loco*," says the Roman whom we all acknowledge as one of the most worldly-wise of men, and behind this saying I am content to entrench myself. The train passing between hills, which in summer must afford some charming views, brought me to my destination almost before the Dorking world was awake. When, however, I entered the Show, which, by-the-by, is held in the Town Hall, a new and fairly commodious building, I found that I was not quite so early as I supposed—some folks were already there, and all the birds which I should have cared to claim were "sold." My first impression on entering was that the pens all looked overcrowded. The Committee at Dorking are evidently fond of the old-fashioned plan of making up a pen with a cock and two hens—in fact, no less than twenty classes required three birds to be entered in one pen. The effect upon the Show in my opinion was injurious. It is often easy to select one good cock and one good hen, but to choose two good hens that match, together with a first-rate cock, is a different matter. Thus many of the pens had one bird with a palpable defect; and in class 17 (Blue-speckled cockerel and two pullets) the feet of the birds were particularly defective. Nor indeed can birds be seen to advantage when crowded; and as the wire pens at Dorking were of the usual size, while large enough for a pair, they were scarcely equal to the requirements of a trio.

My next impression in going round the Show was that it was scarcely up to the standard that might have been expected. I have carried off honours myself there in former years, and know that they were won in large fields and after a hard fight; but the contest even in the open classes this year did not seem severe. Perhaps, as I am older and possibly wiser, my criterion of excellence may be a higher one. However that may be, I am assured the Show is not what it has been. The cause, to my mind, is obvious. If committees fix their shows near the end

of January, they must not expect fanciers who care for breeding as well as winning to send their birds. The Show is altogether too late—much later than it used to be, or, indeed, need be. It is true the number of shows in December—the month in which the Show was formerly held—is very great; but there are not many shows at the end of December, and this is the time I would augest for the Dorking Show. The prizes at Dorking in the open classes are as good—I believe, indeed, that they are better, than those at Manchester. Let the latter attract the northern fanciers, while Dorking could bring together the best birds in the south. Manchester, too, lasts nearly a week, Dorking two days only. I need not dwell on the difference this would make in the choice between the two. The entries amounted to nearly three hundred, divided among thirty-two classes; of these five were “open to all England,” as the bills on the walls were careful to inform us. Four classes contained thirty-one entries, the Selling class thirteen more.

In class 1 (*Dorking* cock and two hens) Mr. Greenhill won the cup with a pen rightly described as “aged.” A grizzled breast and a tail “turning grey” rather marred the appearance of the cock, while the hens have evidently seen their best days. Mr. Ellis, a local exhibitor, won the cup in class 2 (cockerel and two pullets.) The pullets were fair, but the critical declared the cockerel had a wry tail. I did not think so. The cockerels (class 3) were poor, the first-prize bird being good in colour, but of no size. The pullets were also moderate in quality, Col. Lane’s prize pen being but small, though good in colour. The open Selling class contained a good pair of hens, which won the first prize, and were successfully carried off at once by an energetic fancier, who soon saw their worth.

I must not occupy your space by going through all the classes, some of which were good, some decidedly poor. The Local classes for cock and two hens as well as for cockerel and two pullets were not worth much. Mr. Clift, however, showed a pair of excellent hens, and Mr. Ellis a very fair Dark cockerel. The White Dorkings were very poor, some of them not much bigger than Hamburgs. Mr. Cubitt showed one good pen, and Lady Mary Legge would have won a prize had her man not left a ring or mark round the leg of one of her birds. There were large entries of Blue-speckled Dorkings, many of which, however, were bad in colour and in feet. There are few more handsome or prettier birds, to my mind, than the Blue-speckled Dorkings; and I must own to some disappointment in not seeing more true and good-coloured birds. Mr. Griffin’s pullets (class 19) were the best coloured birds, as far as I could judge, and very handsome they were.

The last of the twenty Dorking classes had twenty-one entries (sixty-three birds) to compete for four prizes, given by Mr. Clift to local exhibitors who had never won a prize. They contained some very fair birds. The remaining classes were made-up of other varieties, most of them quite moderate in quality. In *Brahmas* I expected to find Mr. Parea first, but his cockerel had a tail which was almost large enough for a Dorking. In *Bantams* a pretty pair of Japanese was first. The largest *Aylesbury Ducks* had bad-coloured bills, and so were distanced. In *Geese* the prize birds were not true-bred, so that the competition could not have been very severe.

I looked in vain for a class of those lovely birds—the Silver-Greys. Is there a more handsome fowl to be found than a good Silver-Gray cock with his black breast, black tail, and silver-white hackle? I think not, and so was sorry to miss the class. I am told, however, that the difficulty of breeding these birds is greater than ever; that the hens must now be so light in colour that you cannot breed good cocks in the same yard. I know not whether this be true or not; it is, however, to be hoped that the judges will not improve this variety out of our shows, as they seem to have done the Spanish. I have an idea in my head (it may be a delusion) that the Spanish fowl has been almost ruined for practical purposes by the standard set-up at our exhibitions. It is to be hoped that the Silver-Greys may escape a similar fate.

One of our new judges, Mr. M. Leno, awarded the prizes, and seemed to give general satisfaction. An exhibitor of Dorkings, who has won as many cups and prizes as anyone in his time, assured me that he had been carefully through the classes, and could not put his hand on a single mistake.—A DORKING FANCIER.

**DORKINGS.—Coloured.**—Cup, G. W. Greenhill. 2, Lieut.-Col. Lane. 3, Ivory and Son, *hc*, F. May; E. A. Stanford. *Chickens*.—Cup, G. Ellis. 2, R. Chessman. 3, G. W. Greenhill.

**DORKINGS.—Coloured.—Cockerel.**—1, W. J. Russell. 2, G. Ellis. *Pullets*.—1, Lieut.-Col. Lane. 2, J. H. Putney.

**DORKINGS.—Coloured.—Selling Class.**—1, G. Ellis. 2 and 3, H. Humphrey, *hc*, G. W. Greenhill.

**DORKINGS.—White.**—1, G. Cubitt. 2, C. Maw. 3, Withheld. *Chickens*.—1, W. F. Watson. 2, Lady M. Legge. 3, G. Cubitt.

**DORKINGS.—White.—Cock.**—Prize, G. Cubitt. *Hens or Pullets*.—Prize, C. Maw.

**DORKINGS.—Blue-speckled.**—1, Virgo & Son. 2, J. L. Playfoot. 3, H. H. Young. *Chickens*.—1, J. Wood. 2, R. Pittard. 3, H. H. Young, *hc*, J. L. Playfoot.

**DORKINGS.—Blue-speckled.—Cock.**—Prize, Mrs. E. M. Lamb. *Hens or Pullets*.—Prize, W. Griffin, *hc*, Virgo & Son.

**DORKINGS.—Given by Mr. Clift to all persons who have never won a prize.**—1, J. Morley. 2, J. Hammond. 3, J. Peacock. 4, Mrs. E. Chandler, *hc*, G. Yorke, *c*, J. Atkinson; C. Dobson; J. Warreu.

**BRAHMAS.**—Prize, J. Mew, *hc*, J. Pares.

**SPANISH.**—Prize, P. Ruffey.

**GAME.**—Prize, J. Mew.

**BANTAMS.**—Prize, J. E. Bovill, *hc*, J. Mew.

**HAMBURGS.**—Golden.—Prize, J. W. Trowbridge. *Silver*.—Prize, Mrs. T. Warreu.

**DUCKS.—White Aylesbury.**—1, W. F. Watson. 2, A. Fuller. *Any other breed*.—1, J. R. Corbett. 2, Virgo & Son.

**GEES.**—1, A. Batchelar. 2, W. F. Watson. *Goslings*.—1, W. F. Watson. 2, J. D. Taylor.

**TURKEYS.**—1, A. Fuller. 2, C. Dobson.

## LOWESTOFT POULTRY AND PIGEON SHOW.

WITH a knot of true fanciers as the Committee of Management the regulations are sure to give satisfaction, and the Show held at Lowestoft on the 21st and 22nd inst. proved this. The poultry while in the hands of the Society received the greatest care and attention, while the catalogue and awards were printed and dispatched by the same evening’s post—a regulation which, more than any other, gives satisfaction to the anxious exhibitors. The Show was held in the Drill Hall, the pens being the property of the Committee, and of a most substantial kind; those for poultry were placed in double tiers, with the Pigeons in the centre of the room on the top of the poultry.

Of *Dorkings* the winners were Dark Grey. The first were in splendid bloom, the second being very large and dark, but broken-feathered, and somewhat out of condition; the third were good, but young. In *Cochins* Lady Gwydyr had an easy victory for the cup with a capital pair of Buffs, the remainder being also of good quality. In the next class Whites stood first, and Partridge second. *Brahmas* were not numerous, but some good birds competed in both classes, a grand pair of Darks winning the cup; the hen in this pen was the best pencilled bird we have ever seen. *Game* (Red) was a good class, Brown Reds taking the cup and prizes; the Duckwings in the Variety class proved especially good in colour. *Spanish* were very good, the cup pair being a well-shown pair of chickens. *Hamburgs*.—Gold-pencils won the cup against the Silvers; the winners in both classes being very good; the first-named pen were birds of 1872. Some very good Gold-angles were shown, the hens being especially clear in colour and marking; but the cup was carried off in the next class with a capital pair of Silvers. *French* varieties showed-up pretty well, Crève-Cœur winning all the prizes. In the Variety class a good pair of Black Hamburgs won the cup against the French fowls; the second in this class being Golden Poland, and third Sultans. Next came two very large Selling classes, in which were some cheap birds very readily sold. *Bantams*, Red Game, were a fair lot; the winners very good, and the cup for the section awarded there. In the next class Piles stood first and third, with Duckwings second. *Bantams*, Black, were a grand lot; the first a most perfect pair, winning also the cup against the Sebrights, which were, however, very good; the pullets in the Golden variety were most exquisitely marked, the second-prize pen being a grand pair of pure Silvers. Some good Booted Bantams were shown, but few were matched in leg. *Ducks*, Aylesbury, good, but Rouens better; those in the Variety class being Kasarka, Mandarin, and Carolina. Next came the Hon. Secretary’s birds, which were not shown for competition, and comprised some excellent Dark Brahmas and Carrier Pigeons.

*Pigeons* came next, and the entries in most of the classes very good; the Carriers in all cases being a grand display; the cup for the first seven classes was awarded to a grand Black cock. Pouters not numerous, but good, and all Whites. Barbs in both classes only of moderate quality; but the Bald and Beard Tumblers a good class, the first being Blue Beards, second Red Balda of the Short-faced kind, and third Long-faced Blue Balda. Almonds only four entries, the winners, especially the first, very good in head properties; and Fantails one of the best classes seen of late, the prizes as usual going to Newark. Dragons were all named with one exception, some most perfect birds coming to the front, and the cup for the second half awarded to a grand pair of Blues; second very sound-coloured Yellows, and third Reds. Antwerps were, first and third, Red-chequers, and second Silver Duns, the first and second being Short, and the third Long-faced birds. In the Variety class there were many nice pens of the fancy kinds, but the first was awarded to a grand pair of Silver English Owls, the second to Pigmy Pouters. The local element, for which provision of two prizes in each class is made, was very strong, showing the greatest improvement upon previous years, and some birds held their own against all comers, and carried off several of the principal prizes. We are glad to be able to state that the number of empty pens was far smaller than heretofore.

**DORKINGS.**—1 and Cup, F. Parlett, Great Baddow, Chelmsford. 1 Local, A. S. Clarke, Lowestoft. 2, Henry Lungwood, Barking, Needham Market. 3, E. W. Southwood, Fakenham, *hc*, T. & H. Heath; A. S. Clarke; Henry Lungwood.

**COCHINS.**—*Cinnamon or Buff*.—1 and Cup, Lady Gwydyr, Ipswich. 2, Major C. S. Bignold, Norwich. 2 Local, W. P. Matthews, Gorleston. 3, W. Saunders, Lowestoft. 4, J. Watson. *Any other variety*.—1, R. S. S. Woodgate, Penbury, Tonbridge Wells. 2, T. M. Derry, Geomey. 2 Local, W. Haward, Lowestoft. 3, T. L. Nash, Sprouton, Ipswich. *hc*, Lady Gwydyr.

**BRAMMAS.**—*Dark*.—1 and Cup, Horace Lingwood, Creeting, Needham Market. 1 Local and *hc*, H. W. Thirle, Lowestoft. 2, G. S. Pearson, Yarmouth. 2 Local, W. P. Matthews. 3, W. Wright, Lowestoft. 4, W. Branton. *Light*.—1, P. Haines, Flitgrave, Diss. 2, Horace Lingwood. 3 and *hc*, H. Watson, Cringleford, Norwich.

**GAME.**—*Black and other Reds*.—1 and Cup, S. Matthew, Stowmarket. 1 Local, W. Major. 2, H. E. Martin, Southorpe, Fakenham. 2 Local, C. Clarke. 3, C. Page, Lowestoft. *hc*, S. J. F. Stafford. 4, M. Fitch. *Any other variety*.—1, S. Matthew. 2, J. W. Fitch, Romford. 3, H. E. Martin.

**SPANISH.**—1 and Cup, E. W. Whitte, Epworth. 1 Local and *hc*, W. Carter, Lowestoft. 2, F. James, Peckham Rye. 2 Local, W. White, Lowestoft. 3, E. Saunders. *hc*, Major C. J. Ewen; W. Cropley. 4, W. White; W. Cropley.

**HAMBURGERS.**—*Golden-pencilled*.—1 and Cup, J. Webster. 1 Local, A. Smith, Lowestoft. 2, C. N. J. Row, Melford. 2 Local, T. Swatman, jun., Lowestoft. 3, G. & J. Duckworth, Church. *hc*, W. Speakman. *hc*, J. Robinson. *Silver-pencilled*.—1, J. Webster. 2, J. Robinson. 3, H. & A. Hill, Rawtenstall.

**AMERICAN.**—*Gold-spangled*.—1, G. & J. Duckworth. 1 Local and *hc*, Page and Reynolds. *Light*.—1, W. A. Hyde, Hurst, Ashton-under-Lyne. 2 Local, J. Miles, Lowestoft. 3, J. Robinson. *Silver-spangled*.—1 and Cup, Ashton and Booth, Mottram, Manchester. 1 Local and 2 Local, J. R. Bly, Lowestoft. 2, J. Robinson, Garstang. 3, J. Webster. *hc*, E. Hills; H. K. Flatten, jun.; J. E. Bly. 4, S. Booth.

**FRENCH.**—1, J. J. Malden, Biggleswade. 1 Local, J. Wright. 2, W. Outback, jun., Littleport, Ely. 2 Local, Miss E. Smith, Carlton Colville. 3, Miss J. L. F. Fakenham. *hc*, G. W. Fisher. 4, J. Robinson. 5, —Boult.

**ANY OTHER VARIETY.**—1 and Cup, T. A. Wright, Yarmouth (Black Hamburgs). 1 Local, A. Smith (Andalusians). 2, G. W. Boothby (Polands). 2 Local, S. Norton (Andalusians). 3, Miss E. A. Eccles, Southwold (Sultans) *hc*, T. L. Nash (Silkies). *hc*, W. Outback, jun. (Black Hamburgs); J. M. Atkinson (Polands); H. P. Jellieoe (Polands); Lady Gwydyr. 4, A. Smith (Andalusians); S. Norton (Andalusians).

**SPANISH.**—1 and Cup, W. White (Spanish). 1 Local, H. W. Thirle (Brahma). 2, Lady Gwydyr. 2 Local, W. White (Spanish); 3, F. Parlett (Dorking). *hc*, H. Dowsett (Brahma). *hc*, P. Haines (Brahma); H. W. Thirle (Brahma); W. Branton (Buff Cochins); T. M. Derry (Buff Cochins); Major Bignold (White Cochins); W. Saunders (Spanish); W. White (Spanish); H. P. Jellieoe (Golden Polands); A. Bentley (Black Bantams). 4, Rev. S. Philip (Brahma); J. Hill, Brentwood (Brahma); J. S. Pearson (Buff Cochins); Rev. W. F. Dixon (Buff Cochins); E. Saunders (Spanish); J. Keeble, Herrington (Spanish); S. Butcher, Lowestoft (Montevideo).

**SELLING CLASS.**—*Hens*.—1, J. B. Ely (Hamburgs). 1 Local and *hc*, W. White (Spanish). 2, Lady Gwydyr. 2 Local, Mrs. Saunders, Lowestoft (Buff Cochins). 3, W. Burrows, Diss (Brahma). *hc*, H. Dowsett (Brahma); T. L. Nash (Brahma); W. Burrows; Miss Waite, Yarmouth (Dorking and Game); E. Saunders (Spanish). 4, J. Watson (Buff Cochins); F. L. Nash (Buff Cochins); Mrs. Saunders (Buff Cochins); Capps & Beckett, Lowestoft (Silkies).

**ANY OTHER VARIETY.**—1 Local, and Cup, W. E. Newitt, Epworth. 1 Local, W. Robbins, Lowestoft. 2, W. F. Entwistle, Bradford. 3, W. Baskerville, Manchester. *hc*, W. B. Jeffries; W. Baskerville. 4, C. S. J. F. Stafford. *Any other variety*.—1, W. F. Entwistle. 2, —Baskerville. 3, R. Newitt.

**BANTAMS.**—*Black or White*.—1 and Cup, R. H. Ashton, Mottram, Manchester. 1 Local, 2 Local, and *hc*, T. E. Thirle, Lowestoft. 3, R. Titlow, Halesworth. *hc*, J. S. Pearson; C. Reed. 4, M. Leno, Markyate Street, Dunstable.

*Any other variety*.—1 Local, and Cup, W. E. Newitt, Epworth. 1 Local, M. Procter, Hull. 2 Local, W. Herrod, Lowestoft. 3, M. Leno. *hc*, Miss F. E. Somes; R. S. S. Woodgate; F. H. Spashett; W. Herrod.

**DUCKS.**—*Aylesbury*.—1, J. N. Waite, Yarmouth. 1 Local, 2, 3, and *hc*, F. B. Potts, Wangford. 2 Local, A. S. Clarke. *Rouen*.—1, H. Dowsett. 1 Local, 2 Local, and *hc*, J. Wright. 2, F. Parlett. 3, J. N. Waite. 4, Rev. W. F. Dixon. *Any other variety*.—1 and 2, W. Binns, Pudsey, Leeds. 3, M. Leno. *hc*, J. N. Waite.

#### PIGEONS.

**CARRIERS.**—*Cock*.—1 and Cup, E. Walker, Leicester. 2, W. Mison, St. Ives. 3, W. Sefton, Blackburn. *hc*, G. S. Clements. *hc*, H. Yardley, Birmingham. 4, J. Stanley. *Hen*.—1, J. Stanley. 2, E. Walker. 3, H. Yardley. *hc*, E. Walker. 4, W. Nalder. *hc*, W. Mison. 4, C. C. Townsend; G. S. Clements. *Young*.—1, E. Walker. 2, W. Sefton. 3, C. H. Clarke, Old Seinton, Nottingham. *hc*, E. Walker; C. H. Clarke; Ford, London (2); H. Thurlow (2); W. E. Foutres. *Cock*.—1, C. H. Byford, Ipswich. 2, H. Thurlow. 3, L. Watkins. *Hen*.—1, L. Watkins. 2, Owen & Pearson, Kettering.

**BARBS.**—1, D. Bedford, Kirkley. 2, H. Yardley. 3, J. Stanley, Blackburn. *hc*, C. Norman; H. Thurlow. *Young*.—1 and 2, H. Thurlow. 1 Local and C, D. Bedford. 3, W. H. Tomlinson, Newark-on-Trent.

**TUMBLERS.**—*Balds or Beards*.—1 and 2, W. Woodhouse, King's Lynn. 1 Local and 2 Local, C. Cowles, Lowestoft. 3, G. W. Banns, Lowestoft. *hc*, T. Holmes; W. Sefton. *hc*, G. & W. Banns; C. Cowles (2). 4, S. Westerdale. C. Cowles. *Any other variety*.—1, 2, and 3, J. Ford. 1 Local and *hc*, C. Cowles. **CANTAILS.**—1 and 3, —Tomlinson. 1 Local and 2 Local, F. S. Worthington, Lowestoft. 2, J. F. Loveridge, Newark. *hc*, —Tomlinson; F. S. Worthington (2).

**DRAGONS.**—1 and Cup, W. Sefton. 1 Local, 2, 3, and C, A. W. Wren, Lowestoft. *hc*, E. Lee; H. Thurlow; W. Sefton. *hc*, H. Yardley; J. Stanley; W. Sefton.

**ANTWERPS.**—1, A. Beutley, London. 1 Local, D. Bedford. 2, J. Stanley. 2 Local and C, A. Bennett, Lowestoft. 3, W. Binns. *hc*, H. Yardley. *hc*, H. Thurlow; D. Bedford.

**ANY OTHER VARIETY.**—1, —Binns. 1 Local and 2 Local, Miss F. E. Somes, Yarmouth (Danish and Trampeters). 4, E. Silvester, Sheffield. 3, J. H. Watkins. *hc*, H. Yardley; J. Atkins (Hymenith).

**SELLING CLASS.**—1, Local, 2 Local, and *hc*, A. W. Wren (Yellow and Red Dragons). 2, W. Sefton. 3, R. White. *hc*, W. Tomlin (Marpies); J. Ford; Hon. Mrs. Paga (Florentine Roosts). 4, Miss E. A. Eccles (Runts); W. V. Long (Black Barbs); A. W. Wren (Yellow Dragons).

**JUNGES.**—Rev. T. L. Fellowes, Honningham Rectory, Norwich; Mr. E. Hutton, Pudsey, near Leeds.

#### PRACTICE VERSUS PROFESSION.

##### BROMLEY POULTRY SHOW.

The second attempt at a poultry show at Bromley was in quantity and quality a success. But how about management? The Treasurer has long been known as a poultry theorist, criticises all, yet it would seem that self-knowledge and self-criticism would be the most applicable in this ill-conducted business.

1st. A bird, value £25, stolen.

2nd. No receipt given for bought pens.

3rd. No notice sent to owners of sold birds, who anxiously waited their return.

4th. The Selling Pigeon class omitted altogether in the official prize-list.

5th. The London, Chatham, and Dover Railway Company distinctly and in writing deny that any authority was given for the publication that birds would be returned on their line free, thus deceiving exhibitors, who now have to pay, and may have been induced to send pens they otherwise would not have sent. Further comment is needless.—REPORTER.

#### NEGLECTS BY POULTRY-SHOW SECRETARIES.

I ENTERED two pens at the late Cannock Show, and included in the post-office order 7d. for a catalogue, and wrote across the bottom of the certificate of entry that I had enclosed 7d. for catalogue, to be sent off the first day of the Show. My two pens were exhibited, but to my surprise the catalogue had not arrived three days after the Show opened. Of course I wrote to the Secretary, asking the reason, and told him that I expected it would be sent off immediately, or, if it could not be sent, to return stamps, less one for postage—but no reply or notice whatever. I waited a few days, then wrote again—still the same treatment. Then another exhibitor called upon the Secretary at Penkridge. He was not at home, but he left word about the catalogue—still the same effect. Again I wrote, experiencing the same neglect as before. I think that secretaries of shows, having money entrusted to them, should at least send (if they intend to send at all) the second day of the show. It is very well for a man to jump at the idea that he can conduct a show, but he should see that its details are carried out properly, so that there may be no disappointment to those who have entrusted their money to him. Another exhibitor, who won a cup there, did not know till ten days after the Show. He was depending on my catalogue being sent.—GEORGE RODEN, Penn, near Wolverhampton.

[We insert the above as one of many similar complaints. The least that an honest secretary could do would be to return the stamps, deducting one for postage.—EDS.]

#### REMOVING FOWLS FROM THE LATE BRISTOL POULTRY SHOW.

I WAS induced to exhibit a few pens of Dorking pullets, having a wish to see my birds stand side by side with others, so that I might be enabled to judge of their merits. On entering the Show on Saturday I found that my two pens of pullets had been highly commended, and both claimed; but guess my surprise to find that one pen of birds was taken away, notwithstanding the rule laid down that birds cannot be removed before Tuesday morning. Will any single-minded exhibitor say I have been fairly dealt by? I have asked for the addresses of the purchasers of each pen, and that has not been granted me. I have had birds claimed at the Birmingham and Crystal Palace Shows, and have invariably been furnished with the name of the purchaser. My object in speaking thus through your Journal is the hope that such errors will not again be repeated.—A LOVER OF FAIR PLAY.

#### THE CORAL-EYED PIGEON.

ANYONE who has paid attention to the subject will have perceived a great diversity in the colour of the iris in the eyes of Pigeons. The Tumbler, Barb, and Jacobin should both be clearly white or pearl-eyed; the Pouter should be orange-eyed; and the Carrier has a bright red or fiery eye, but nothing to compare in brilliancy to the eye of a Pigeon bred in India, which the natives call the "coral eye." I have seen many of them, and the colour in all cases was light blue with black bars; the size about the same as a flying Antwerp, and with a stout but not wattled beak. The iris of the eye is of the colour of a ruby of the finest "Pigeon's blood" tint, and so brilliant and pure that it can be distinguished, and in fact calls one's attention, at the distance of 3 yards or more.—J. C. LYLE.

#### NORTHERN COUNTIES COLUMBIAN SOCIETY.

THE annual meeting of the above Society was held at the Cathedral Hotel, Manchester, on the 19th inst. The Secretary laid before the Committee a most satisfactory report of the finances of the Society, also of an increase in members. Mr. Ernest E. M. Roys was re-elected President; Mr. J. B. Pinder and Mr. T. H. Kidpeth the Vice-Presidents. The Hon. Secretary is Mr. W. K. Haycroft, 215, Lower Broughton Road, Manchester. The Society has now about fifty members, and in some varieties of Pigeons is very strong. It has done nothing more about the challenge, but hopes are entertained that it will be effected this year.

OXFORD POULTRY SHOW.—The date for the third Show is fixed for the 23rd and 29th of October. The late Show having financially, as well as in point of numbers and quality, proved a success, it is proposed to increase the value of the cups and

prizes, and following in the wake of Cambridge, special prizes in the majority of the classes will be given to be competed for by local exhibitors only. Numerous suggestions previous to the late Show having arrived too late for consideration. The Committee invite the support and opinion of fanciers whose breeds are not already represented in the schedule.

### COMING RABBIT SHOWS.

THE Fakenham and West Norfolk fourth annual Exhibition, to be held on February the 3rd and 4th, is the next Show of any importance to Rabbit fanciers. It has two classes divided in the usual manner—viz., one for Lops, the other for Any foreign variety, with moderate prizes (including one for the county only), and a silver cup value £2 2s. The entries are already closed. Nantwich follows on February 6th, but is of little or no importance.

Hanley Grand Show will be held on February 10th and following two days. This gives four classes and two prizes to each, besides extra prizes of pottery, &c. The entries, which close on the 31st inst., will, I hope, be numerous, thus encouraging Hanley to give more classes next year.

The first Kettering Exhibition is announced to take place on the 17th and 18th of next month. Although Rabbits are rather scantily provided for, I wish it success with hopes that it will increase in classes as it progresses. The classes are three in number, with three prizes to each of them, and include a selling class, which I hope will be well filled. Entries close on the 2nd.

Walsall has three classes, one for length of ears, another for all properties, and the other is a selling class (price not to exceed £2 in the last). There are good prizes to each class, and a three-guinea cup for competition between them. The Show is to be held in the Agricultural Hall of Walsall, on February 20th, 21st, and 23rd. The entries are priced low, and close on the 9th. Mr. Henry Yardley, of Birmingham, is the appointed Judge, whose awards gave great satisfaction last year.

King's Lynn will give a grand Exhibition on the 26th and 27th of next month. This Show has no less than seven classes for Rabbits, not very well divided, but, nevertheless, with good prizes to them. I hope that this first meeting will be well supported with plenty of entries, since if this is the case, the Committee will no doubt give more classes and prizes at its future exhibitions. Altogether King's Lynn has, I think, made a good start in the right direction. I must not omit to note that all entries close on the 12th. February is rich in exhibitions for Rabbits, and will doubtless be welcomed by fanciers; not less so, however, is March, but of these I will treat in my next on the subject.—A RABBIT FANCIER.

### BELFAST CANARY SHOW.

THIS was held in connection with the Poultry and Pigeon Show, of which the award of prizes was given at page 68. I would preface my notes thereon by calling the attention of English fanciers to two things: That the Show merited their hearty support, and that they didn't give it; in the doing or non-doing of which, I think they made a great mistake, which, I feel satisfied, only requires to be pointed out to ensure its non-recurrence. The somewhat contracted nature of the schedule might possibly, to a great extent, account for this, though there was ample room to make up a fair entry in those varieties which are cultivated on this side of the water. There might also be some hesitation in sending birds across the sea; but on that score let me assure exhibitors there is no ground for apprehension. Birds dispatched from almost any part of England by either of the usual routes on the evening of one day land in Ireland next morning, and the quietest and warmest part of the journey is in the saloon of the steamer. The question of transit should really be no bar to the success of a show in the sister isle.

Just a word in the ear of exhibitors and Canary fanciers generally. You all know as well as I how desirable it is that Canary shows should be in the best possible hands, and what an excellent thing it would be if they were more frequently held in connection with first-class poultry shows, with the liberal scale of prizes and other incentives to emulation which the funds of wealthy societies are in a position to offer. There can be no doubt that a display of cage and song birds is a great adjunct to any show; for though among the crowds of visitors who throng the avenues of poultry and Pigeon exhibitions there is, as in all similar gatherings, a large proportion who look on with the critical eye of a fancier, there is a much larger proportion who visit shows simply as sight-seers; and the more attractive the spectacle can be made, independently of its intrinsic excellence, the greater will be the concourse of visitors, which means influx of revenue and consequent financial success.

Surely there is as much to attract and interest the ordinary sight-seer in a display of birds as in pens of Geese, Ducks, or Turkeys, which, mustering in comparatively small numbers, and presenting by no means an imposing spectacle when viewed from

other than a critic's standpoint, yet absorb a considerable portion of the prize funds. And the music, too, will bear comparison. A recitative from a Goose with chorus from surrounding pens is more noisy than melodious, and not more attractive than the delicious melody which greets the ear when some hundreds of songsters are chanting their lays in notes which give a life and cheerfulness known only to the bird show. I know very well that poultry takes the lead in every way, and do not begrudge it the enviable position it has attained; but I don't feel disposed to be "sat upon" by cats! If pussy has now become an object of attraction—and they are trying to breed cats up to standard markings, to produce tortoiseshell Toms and yellow-striped Queens—surely there is hope for us! The breeding and exhibition of high-class poultry and Pigeons is the luxury of the wealthy, while our quieter but deeply-interesting hobby is essentially the child of the working-man, the companion of the unobtrusive thinker, who loves to be absorbed in such a pursuit rather than in the many objectionable pastimes which beset the path of the artisan, glad to find some relief for the mind after the drudgery of his daily toil. Still, each in its way is but a hobby, widely differing in character and treading a different walk; and I think all true fanciers and admirers of the best of everything of its kind should recognise the breadth of idea and liberality of those who, in organising an exhibition of their own particular speciality, do not confine it selfishly to that which they alone admire, but open their purse-strings to make the exhibition more comprehensive, and embrace every variety of domestic bird, from the lowly tenants of the poultry-run and the wonders of the Pigeon-loft, down to the equally wonderful varieties of modern Canaries, and the more modest but not less interesting songsters of our woodlands, or the less melodious but more gorgeously-attired denizens of far-off lands. I see no reason why, during a great portion of the year, poultry shows and bird shows should not go hand in hand, and am well assured each would be mutually benefited.

"The best route is to Stranraer, and then by steamer to Larne—about three hours' passage, and in daylight. Yours truly, W. G. Mulligan." Yours truly W. G. Mulligan had said, in a previous note, something about Fleetwood and Barrow; but a reference to the map showed it was a roundabout way, ending in a long dotted line, indicating the track of the Belfast steamers. The dotted line was far too long for me. It looks very well on the map; but half a day at sea when the Fitzroy drums are hoisted is not so — well, try it. Commend me to the Stranraer route with only three hours' sea passage, and in daylight. To arrive in time for the steamer necessitates an early start; but the view at daybreak amply repays for any inconvenience of that sort. Daylight saw us at Castle Douglas, and thence to Stranraer the line runs through the wildest country. One sometimes sees bits of warm colouring in hill scenes, especially in chromos, and we wonder whether such things are; but no art could depict the wild beauty of this corner of Scotland; and were it coloured true to nature, few would believe in the picture. To one living in a district where the winter landscape is of the chessboard pattern, with large black and green squares interspersed here and there with homesteads, pretty enough in its way, it was something new to travel for many a mile through the grand old hills, many of whose lofty ridges were sprinkled with snow, while on their rugged sides and in the valleys the rich hues of autumn still lingered in warm glowing tints, unlike anything but themselves. No trace of any habitation was visible for miles, except occasionally a rude peat-thatched hut, and no signs of life other than a few sheep, with snowy fleeces, or a small drove of rough, wild-looking, shaggy oxen, with now and then a few Grouse, which, disturbed by the passage of the iron horse, took wing lazily, and settled down again quietly when the rush was over. One or two stops (at one of which a Cochon, which I saw fall off a barrow at Carlisle, then turned upside down, and finally almost pitched into the van, broke the silence with that peculiar crow and a cadenza in A minor, in which his heart delights), and we pulled up at the rude open platform on Stranraer pier, where the "Princess Louise" was waiting to give us a taste of "about three hours' passage, and in daylight." Yours truly, W. G. Mulligan, who sat at home at ease, how little did you think upon the dangers of the seas when you lured four unsuspecting victims on board that steamer! For besides myself and Mr. Baxter, it transpired that my colleagues, Mr. Jones and Mr. Leno, were on board, and had travelled with us and the melancholy Cochon from Carlisle.

The little town of Stranraer is charmingly situated at the south end of Loch Ryan, which, a fellow *voyageur* assured me in a Scotch accent, was the prettiest salt-water lake in Great Britain. If there be prettier, pretty indeed must they be. Horse-shoe-shaped and enclosed by hills, it presents a noble sheet of water, up which we steamed for some thirty or forty minutes at fourteen knots in smooth water, during which few minutes of peace most of the saloon passengers indulged in breakfast. I didn't. I couldn't quite make up my mind whether it would prove a freight to be carried comfortably in a heavy sea. Some cargoes are apt to *shift*. So I stowed myself quietly away, and

watched the tarpaulins being placed over the baggage, and the canvas awnings rigged to windward, and other signs of preparation for a dusting; while my Scotch friend pointed out the beauties of the Loch and the little village of Cairnryan, with its white cottages, its church, and its lighthouse, dotted like baby-houses on the east shore under the shelter of the high land. Before emerging from the Loch into the open sea most of the passengers came on deck. One naturally takes stock on such an occasion, and I was rather impressed with an Ulster coat, seal-skin cap, long greyish beard and short maerschaum, which said how it had enjoyed the fried fish below. Fried fish! hot! and the "Princess Lonise" evidently beginning to be drunk and rolling about in a most improper way. But the Ulster coat seemed to enjoy the fun, and was evidently in for three hours' enjoyment—and in daylight. Beside me was a horserug, and under it was Mr. Baxter; and by-and-by, when the "Princess" was behaving in a way altogether beyond the bounds of common decency, I saw the Ulster coat and the horserug going through a most expressive pantomime, backing, and filling, and tacking, with the intention of speaking each other; and ultimately—(whether Mr. Baxter brought the Ulster coat or the Ulster coat brought Baxter I won't hazard an opinion, but my impression is each was glad to hold on to the other)—the Ulster coat was introduced to me as Mr. Jones. We shook hands, but I didn't rise; I thought if I did something else might rise, and, as my Scotch friend (who had vanished) said, "it comes on you in a moment." Another half-hour, and we were fairly in for it. Loch Ryan was far astern, and Lough Lorne on the Irish coast was far ahead. Away to the north, Ailsa Craig loomed in the distance like a huge sugarloaf, and the only craft I could see were a screw collier and a schooner apparently bound for the Clyde; and the heavy seas, after giving us a pitch and a roll, and jumping over the paddle-boxes, and over the engine-room, and down my neck, chased one another in a wild gallop after the screw and the little schooner; and after taking a peep on board rushed on to spend their strength on Ailsa Craig. I had experienced a deal of chaff before leaving home, and the horrors of the middle passage had been so pleasantly depicted by sympathising friends that at one time I was considering the advisability of going into training on a swing and taking regular exercise in a mild way in a rocking-chair. The fate of the wretched man who, in describing his sensations when sick, said, "At first I was afraid I was going to die, but at last I was afraid I wasn't," was held up as a warning to me, but none of these horrors overtook me; and by the time we got under the shelter of the Irish land, and what remained of Mr. Leno, who had been stowed away below, had been brought up out of the saloon, and Lorne opened the arms of its friendly little Lough to welcome us to Ireland, I was ready to aver that the "three hours' passage, and in daylight," was a most enjoyable part of our journey. An hour's ride by rail, skirting Belfast Lough all the way, and we were in the metropolis of the North of Ireland, and, chartering a "kyar," were soon deposited at the "Imperial."—W. A. BLAKSTON.

(To be continued.)

**OVERFEEDING FOWLS.**—In my experience of keeping fowls I have been more troubled with overfeeding than with any other poultry ailment. I have just lighted upon the following fable of Æsop:—"A woman possessed a hen that gave her an egg every day. She often thought with herself how she might obtain two eggs daily instead of one, and at last to gain her purpose determined to give this hen a double allowance of barley. From that day the hen became fat and sleek, and never once laid another egg." This fable may not be generally known.—C. H. S.

## FEEDING BEES, AND HONEY EXHIBITIONS.

"A LANARKSHIRE BEE-KEEPER" expresses surprise at the mode of feeding advocated by myself, which is in the main similar to that recommended by Mr. Pettigrew. The fact is that I for my part find the bottle not always to be relied upon. Given every favourable circumstance, the hives populous, and the bees hungry, the bottle placed just over the greatest mass of them, the weather warm enough, and the food of the exact consistency, neither too thin nor too thick, then I grant the bottle is the best feeder of my acquaintance, and I have tried a great variety in my long experience. But what if any, or perhaps all, of these circumstances be wanting? In point of fact, this feeder, good as it is in itself, often fails in saving a hive, and particularly in cases where the bee-keeper is mostly absent from home by day and cannot watch his hives. The pages of THE JOURNAL OF HORTICULTURE bear witness to the frequent disappointments which have followed from its sole use in times of trial. *Experto crede.* As to the "fuss of feeding so hurriedly," all I can say is that oftentimes the sooner it is over the better. It may be prolonged with advantage at times when it is desirable to keep up (as in autumn), or to quicken (as in spring) the breeding of young bees; but in most cases, and always late in the year when it is desired simply to bring a hive up to a

proper weight of food, it is obvious that the sooner it is over the better. To prolong feeding unnecessarily is to stimulate the hive unnecessarily, and that at a time when every bee's life is precious, and the risks of loss are great. Surely, then, the quicker it is over the better. I must add that I do not recommend "pouring 2 lbs. of sugar at a time on a hive of bees."

And now to another subject. I must confess that I read with amazement the open defence in your columns of the 22nd inst. of the "unrestricted" exhibition of supers, such as were shown at Manchester last year. All I can say is, that I for one should decline to subscribe to or to visit any such exhibition in future. After all, where is the difference in the cases put forward by your correspondent Mr. Bagshaw, and branded justly by him, and cases like that to which I have alluded? "To sell sugar syrup for honey, or foreign honey as the pure nectar of English flowers, is right down dishonest, and deserves visiting with as severe punishment as any other fraud." Well and good. But where is the difference in my offences if I exhibit, as the *bonâ fide* produce of a stock of English bees in any given summer, a super which is filled with honey artificially gathered (not from flowers by the bees themselves), and artificially stored in cells which are not of the bees' own constructing? Here is "a distinction without a difference!" If the object of exhibitions be merely to gratify a gaping curiosity—to produce "something strikingly grand for visitors to look at," as Mr. Pettigrew puts it, then we are going in for "Barnum" to an extent that is destructive of all reality and truth, and I answer unhesitatingly that "shows (of this kind) have a demoralising tendency." If it be legitimate to "resort to every method that art can suggest to accomplish the desired result," why stick at any cheater or dishonesty? I may be very old-fashioned, and my notions very out of date, but I confess that I rarely attend any exhibitions of flowers and fruits, or poultry, because of the shameless tricks which are "perfectly understood" to be practised in order to produce "something strikingly grand" in the way of effect. The same applies to the enormously fat cattle and pigs which have been exhibited at Smithfield and other shows of a like kind. The result is disease, and not wholesome meat. When shows were first instituted, the object certainly was not to astonish the vulgar, but to improve our methods of production, to stimulate industry and enterprise in that direction, and to push reality to its utmost limits in every department of horticulture and agriculture. It has had a marvellous success, but I challenge contradiction to assert that that success has been owing to art apart from truth.—B. & W.

## OUR LETTER BOX.

**BROMLEY POULTRY SHOW.**—The first prize in "Bantams, any other variety," was awarded to Mr. Charles Reed for Blacks. (*H. Ritchie*).—You should return the birds wrongly sent to you, and demand from the Secretary your own birds or the £30 at which they were catalogued. If you have neither sent to you, consult your attorney. (*D. C.*)—You certainly ought to have had your birds before the 16th; but who was in fault, the Secretary or the railway officials? The third prize for Light Brahma hens we are informed was awarded to Mr. J. Mitchell, and that Mr. E. J. Reeve received an extra prize.

**BANTAMS WITH OTHER FOWLS** (*X. Y. Z.*).—If your "common fowls" are such as Dorkings and Brahmas, they might be in the same run without fear of the Bantam chickens being cross-bred.

**HENS NOT ANSWERING EXPECTATIONS** (*Thomas*).—We think you have no remedy. Hens when removed to another yard are liable to irregularity; and the conclusive bar to any claim against the vendor is that you saw the hen and bought her, having only a doubt about her age. You have no proof to show she is older than was represented.

**EGG-PRODUCERS** (*Welby*).—We did not mention the Hamburgs. Those we did name lay nearly as many eggs, and those they lay are much larger. We repeat we should keep either Spanish or Creve-Coeurs. We would give them the run in the orchard; and if you are disposed to try Hamburgs, turn some Golden-spangled into the street. Your orchard range will accommodate a larger number than you name. You must secure winter eggs by keeping spring pullets.

**BROODY BRAHMAS** (*N. T.*).—"What," said my aunt, "shall I do with this boy?" "Give him some breakfast," said Mr. Dick. It was what the boy wanted, and it was the right thing to do. What are you to do with broody Brahmas? Let them sit. It is what they want, and it is the best thing for you to do. Give them thirteen eggs each. They will hatch most of them, and they will be the most easily-reared chickens of the year, and the most saleable birds. We wish we had them. We are praying for broody hens, and seeking them far and near. You have bought fourteen pullets since December 4th. They have laid 104 eggs—lowest value 17s. 4d. In three weeks you will have from eighteen to twenty chickens. In the meantime you have four pullets still laying, and the two about to change their occupation will lay again in March. We congratulate you on your success. No amount of management could enable you to do better.

**FOWLS IN VERY SMALL SPACE** (*L. A. B.*).—You may keep a cock and three hens, either Brahma, Cochins, Spanish, or Creve-Coeur, subject to providing them with grass on growing sods; green food, as lettuce, &c., and small heaps of road grit. If the yard is paved, you must cover it some inches thick with gravel or grit.

**ARRANGEMENT OF COCKS AND HENS** (*J. P.*).—As many hens and broods as you have may be put together. It does not make the slightest difference. You may also run all your birds together. We advise you, however, to remove two of the cocks in March and another at the end of April.

**BLACK BANTAMS** (*Bantam*).—We do not believe you can use a White cock without injury to your breed unless you have hens or pullets that have been

kept apart. You will be too late for this year, but you should buy or borrow the best cock you can find and put him to your own pullets. Save all the eggs for sitting, and next season you will have fresh blood throughout the run. Wherever it is wanted to breed the best of anything there should always be a reserve yard or pen.

**THE POULTRY HAREM (W. D.).**—Your average of eggs is far above our experience, and we are sure far above that of most of our readers and correspondents. Our theory is, four hens to a cock in January, six in February, eight in March, and no rule afterwards. We speak of the runs where the eggs are laid that we intend to set.

**EGGS BLOOD-STAINED (Soldier).**—Have you been using stimulating food to promote laying? If you have, that is the cause. Whether you have or not, something the hens eat causes the appearance of which you complain. Whether by accident or design you leave the beaten track, you are sure to go astray. If you will feed on ground oats or barley meal morning and evening, on some maize or table scraps at mid-day, and avoid all things that are said to be so good for fowls, you will have proper eggs. If your fowls are kept in confinement you must supply them with fresh earth and growing grass.

**HENS' NESTS (E. H.).**—A basket will make a sitting place for a hen, so will a butter-tub sawn in half. The sooner you set Dorkings the better. We prefer the Rouen to the Aylesbury Duck, unless you wish to eat very early ducklings. It is essential for eggs that they should be damped before hatching. Failing that, some die in the shell, some come out weak. In the case you mention the hen left her eggs every morning in all weathers to feed, and, unless your climate has differed from all we know, she could not do that without returning to her nest wet through.

**VARIETIES TO PREFER (Young Fancier).**—You may keep Spanish, Houdan, Crève-Cœur, or Brahma, we think the latter. If the run be not grass you must provide them with it. Let the door of the house be in one corner and not in the middle.

**VARIOUS (Jack).**—You may give all your scraps. We give no artificial foods. Feed your Crève-Cœurs on ground oats, barley meal, scraps, and a little maize, and if they have a grass run they will do well. Some say the hybrid Pheasants you mention breed, we do not think they do.

**BRAHMA CHARACTERISTICS (Brahma).**—The Brahma hen has no tail as the word is understood in other breeds, save the Cochins; there is merely a rise from the rump terminating in a point, instead of getting wider towards the end as in other breeds. The cock's tail should be carried neither horizontally nor erect, but midway. An erect tail is a defect.

**BONE DUST FOR FOWLS (Idem).**—We do not believe in feeding on bones. It is a mistake. Fowls are not different from other things. The natural food of a fowl supplies all that is necessary for growth and the formation of bones. Doctors do not prescribe bones for infants, and birds in a state of nature cannot get them. If you will supply good ground oats and barley meal or other corn in which the hull is ground with the flour, you have all you want. All the material of bone and sinew is especially found in the hull of oats.

**MAIZE FOR FOWLS (L. A. B.).**—Maize is an adjunct. It is not good food by itself, as its property is to make fat. It may be given as one in three meals, but not more. It should be given raw, and its merit as winter food is, that the small birds cannot pick it up. Ground oats and barley meal mixed with a small portion, say a twelfth, of meal served slack in a trough, is the best food for fattening Turkeys. The largest Geese are the Toulouse; they commonly attain the weight of 20 lbs., and are of undeniable quality. They lay large numbers of eggs, but do not sit.

**A NON-LOVING COCKEREL (Brahma).**—Such dislikes are rare, but they occur sometimes. In the experience of forty years we have only met with it once. We should try the gentleman longer.

**NUMEROUS DEATHS (Boynton).**—Wholesale and speedy death can only be accounted for by poison, and we believe this is your case. Many animals are strangely affected by disinfectants.

**HOUDAN'S HOCK BROKEN (Sam).**—Your Houdan cock is useless. If the bird is cured (?) he will have a stiff leg. We answered your question as plainly as we could. A bird hatched in 1873 is not a cockerel in February, 1874. The mistake is with those who made the list. A bird hatched in January, 1873, is, in February, 1874, thirteen months old and an adult. No judge in the world can tell the difference between a hen of thirteen months and one of two years. They may guess at the cocks, but they cannot be sure. If at a show in February there is a class for chickens they must, of necessity, be birds of the previous year. It opens a door for false entries.

**COCKS FIGHTING (Rus in Urbe).**—The only cure is to let them fight it out. If they are only in fair proportion to the opposite sex there will be no fighting. We have a hundred Brahma hens running with twenty cocks—we have not had a fight. If you are disposed to overcome the pugnacity of your birds, employ a boy, furnished with a long rod to which an empty pillow-case should be tied at the end; when two begin fighting, let him buffet both alternately with the pillow-case—they will soon leave off.

**POINTS IN A SHOW DRAGON (W. T. C.).**—Dragons should not be large birds, but of moderate size, neat and compact in form, tight in feather, have sharp-pointed wings, be broad in shoulder, with buttes well displayed, and narrow-rumped. The head should be long and straight; skull narrow, well-developed at the back. The eye should be large and prominent; the lash, cere, or flesh-wattle uniform, equal, white, and circular, with but little of it. The wart upon the beak should be small, and not overhanging. The neck should be long, slender, and graceful; the carriage erect; the legs long, clean, and angular; the feet large. The general bearing of these birds is of a timid, tremulous kind, invariably displaying a shaking and nervous temperament. Blue Dragons should be of a good sound colour upon the sides of the wings, head, belly, thigh, back, and tail. The head is generally of rather a darker hue; the neck also dark, and gorgeously illuminated with bright iridescent colours, and terminating in a distinct and circular line upon the shoulders, breast, and back, thereby producing a pleasing contrast with the lighter and less brilliant parts of the body; the lower extremity of the wing covers has two narrow and jet-black bars running obliquely, and terminating just above the thigh; the tail also has a band of black about an inch wide, and within a quarter of an inch of its end; the flight feathers are dark. The beak also must be dark; the eye of a bright red colour; and the legs and feet red, and with dark nails.

**MAKING RED COCK JACOBIN OR TERRIT (Amateur).**—As you want a solid deep-red colour, failing obtaining mates of that colour, we would advise your mating your birds to good blacks.

**PIGEON'S BEAK BROKEN (Constant Reader).**—The bird suffers from the broken beak; and although he may appear to feed well, it is evident he does

not. We use for the destruction of all parasites carbolic acid and water—one part in fifty. It requires to be carefully used, but it is infallible as a destroyer of all parasites.

**TRANSFERRING BEES (C. H. E.).**—We thoroughly understand your questions, but cannot advise you to follow the "OLD MAN'S" plan of getting bees to leave their hive. We have never found a queen to leave its hive when treated as the "OLD MAN" suggests. Many of the bees go back to the old place, but will not stay in an empty hive. They molest the other hives standing near in seeking a home. We think the "OLD MAN'S" plan carried into practice would be ruinous to nine hives out of ten. The other way of driving or shaking the bees out is more certain of success, and easy of accomplishment.

**PARROT SELF-PLUCKED (R. W.).**—Your Indian Parrot has contracted a very bad habit which is common among such birds when kept long in confinement. All the varieties of Parrots are fond of gnawing, and when not able to gratify this natural propensity they bite off their feathers. To prevent your bird destroying its plumage, fasten a piece of wood inside its cage with wire, with which you will find it will amuse itself. Change its food as often as possible by giving it fruit, boiled rice, nuts, &c., and a little magnesia might be occasionally put into its drinking trough. By no means let it have any fat with its food, and discontinue its bath, or the bird may take cold at this season. If this treatment has no effect see sketch in JOURNAL OF HORTICULTURE for another remedy, date July 2nd, 1873, No. 640.

**GLAZING AN AQUARIUM (An Amateur).**—If the putty is put only between the glass and the frame, and the glass fits closely, not the slightest injury to the fish, &c., will occur.

#### REMARKS.

- 21st.—Fine morning, bright noon, and beautiful weather all day.  
22nd.—Very dark and foggy all day except for a short time between 1 and 2 p.m.; rather less foggy at night.  
23rd.—Rain and slight fog at 9 A.M. and during most of the morning; bright between 1 and 2 p.m., but dull afterwards.  
24th.—Rainy morning, becoming finer towards noon; fine evening.  
25th.—Fine frosty morning; very bright in the middle of the day, and continuing fair all day.  
26th.—Bright morning, but rather dull and overcast in the after part of the day.  
27th.—A most beautiful day throughout, and splendid moonlit night. Although not quite so warm as some previous weeks it has been more pleasant, with bright sun on several days.—G. J. Symons.

#### COVENT GARDEN MARKET.—JANUARY 23.

Both the London and provincial markets are comparatively inactive at present. Prices remain nearly unaltered from last quotations, and imports have been somewhat lighter during the past week. Kentish Cob Nuts are still offered in considerable quantities, and a slight reduction has had to be submitted to in the trade, prices varying from 75s. to 80s.

10	TU	Royal Horticultural Society's Annual General	44.9	30.1	37.5	16	26	7	3	5	8	2	24	10	2	14	29	41
11	W	Meet. of Society of Arts, 8 P.M. [Meet. 3 P.M.]	44.5	29.8	37.2	19	24	7	5	6	25	3	51	10	24	14	29	42

From observations taken near London during forty-three years, the average day temperature of the week is 45.6°; and its night temperature 31.8°. The greatest heat was 65°, on the 10th, 1831; and the lowest cold 3° below zero, on the 11th, 1845. The greatest fall of rain was 0.67 inch.

## THE VALUE OF FUEL.

THE remarks of Mr. Abbey in one of the numbers of the Journal towards the end of last year, and the interesting experiment which he had previously recorded, open-up a subject of great importance to the horticulturist, as indeed to the public. I will endeavour to reply to Mr. Abbey's queries, but it will be most convenient to do so in the order which a discussion of the questions involved naturally takes. I may, however, here remark that while Mr. Abbey's tables of heating power (in which the second column should be from 32°, not zero, to 212°) are roughly correct as regards the comparison of different fuels, yet as they have been constructed from observation of the greatest amount of heat obtained, they are open to the suggestion that combustion in different forms of apparatus would probably lead to different results. It will be better, then, to commence by giving the total quantity of heat which each different combustible is capable of yielding, leaving to after-consideration what arrangements in practice are calculated to render the largest possible amount of such heat available.

The amount of heat given out in combustion is usually estimated in "units of heat"—i.e., the number of pounds of water raised 1° by the combustion of 1 lb. of the fuel. Care must be taken in using the figures of different experimentalists not to confuse the degrees Centigrade, in which many of the observations are recorded, with degrees Fahrenheit. To convert the former into the latter the number must be multiplied by 1.8. I shall, however, use degrees Fahrenheit alone. Further, in order to convert observations of the number of pounds of water vaporised at 212° into "units of heat," it is necessary to multiply by 962, which is the latent heat of steam at 212°. According to the average of the most recent observers the units of heat evolved, and corresponding quantity of water evaporated from 212°, by the principal elements of combustion are in round figures—

	Units of heat.	Pounds water evaporated from 212°.
Carbon.....	11,500	15
Hydrogen.....	61,000	63.5
Sulphur.....	4,000	4.14
Carbonic oxide..	10,000	10.4

I give the latter (carbonic oxide) in order that it may be seen that if by imperfect combustion carbon is only converted into this gas, it only produces about one-third of the heat which it gives when converted into carbonic acid by perfect combustion, the remaining two-thirds being evolved by the combustion of the carbonic oxide; and the reason is that carbon in passing into a gas absorbs and renders latent, just as steam does, a large proportion of the heat evolved, while after it has reached the gaseous stage its heat of combustion becomes wholly sensible heat.

Partly from these data and partly from direct observation, the heat given out by fuels of compound nature

has been pretty accurately ascertained. It must, however, be kept in view that coal and coal gas are both of a variable composition, and hence the figures can only be regarded as an average, from which considerable variance may occur.

	Units of heat.	Pounds water evap. from 212°
Coal gas .....	25,200	26
Petroleum .....	20,500	21
Oils, wax, &c. ....	18,000	18½
Welsh steam coal .....	15,400	16
Newcastle do. ....	11,400	15
Do. household coal..	13,000	13½
Coke .....	12,500	13
Dry peat .....	9,620	10
Dry wood .....	7,200	7½

These, however, are the results obtainable only when combustion is absolutely perfect, and when the whole resulting heat is obtained for measurement. In the case of compounds containing hydrogen, if the gases formed pass-off before being reduced below 212°, so as to condense the steam into water, the latent heat of the steam absorbs about one-fifth of the total heat due to the hydrogen. And it may show how difficult is the utilisation of the heat if I mention that in the only direct experiments made on the heat evolved by coal gas with which I am acquainted, though they were carried out by so eminent a chemist as Dr. Dalton, the heat measured reached only 12,000 units, or less than one-half of what theory would assign. So also in regard to coal, the experiments of Watt, Black, and Rumford assigned it only an average of 7000 units, which in practice is still found generally correct, although in the Cornish engines, which are constructed so as to economise the whole heat, an amount not materially less than that given in the table has been occasionally reached.

The only method by which, in the application of heating apparatus to buildings, it is possible to extract from fuel an amount of heat approaching to the theoretical values is by direct combustion within the building itself, either retaining the products of combustion in the atmosphere, or so conducting them through cooling surfaces that they yield the whole of their heat before passing into the open air. Thus a petroleum or oil lamp burned without a chimney in a greenhouse will give heat quite equal to the tabular figures. A gaslight burned under a chimney will give the tabular heat, minus so much as passes off through the chimney. A brick stove, burning coal or coke, will give the heat due to the fuel minus the amount contained in the air and steam which goes up the chimney. This is reduced to a minimum when the air admitted is just sufficient for perfect combustion, as in the Arnott stove, or when the chimney is elongated into a flue, which abstracts most of the heat from the gaseous products before they escape: hence the remarkable effect produced by small quantities of fuel in Mr. Rivers' brick Arnott stoves, which are wholly within the house to be heated. A flue apparatus with the furnace fed from a stokehole is more wasteful by the amount of heat given off in the stokehole itself, which may be much or little, according to the arrangement. But the most

wasteful of all is a hot-water or steam-heating apparatus without the addition of smoke flues. From the most perfect of these the gases of combustion must pass off at a temperature hardly under  $212^{\circ}$ , for the water cannot abstract heat below its own temperature; but in practice even this result is never approached.

In the best ordinary steam engines the proportion of boiler exposed to the action of the fire and hot gases is not less than 5 or 6 square feet for every pound of coal consumed per hour, yet the air as it escapes from the chimney has a temperature of  $500^{\circ}$  to  $800^{\circ}$ . The Cornish engines expose a very much larger boiler-surface. I have not the figures at hand, but possibly some of your correspondents could supply them. If a good marine or fixed engine, carefully watched by a stoker who adds fuel every few minutes that it may burn clear and bright, and presenting a boiler-surface to the fire to the extent above mentioned, is only able to extract 7000 units of heat from coal which actually yields 14,000, how enormous must be the loss of heating power in an ordinary hot-water boiler, in which a change of fuel is expected to last many hours without attention, in which the boiler-surface instead of being at the rate of 6 square feet per pound of coal per hour is probably not one-tenth of that extent, in which the smoke is hardly at all consumed, and the temperature of the effluent gases at the chimney top is probably not much below a red heat.—J. BOYD KINNEAR, *Guernsey*.

(To be continued.)

### PEACH FORCING.

FORCED PEACHES will require more than ordinary care this season. August—a very important month to those who have to force early fruit—was very wet and dull, at least in the western counties, and not at all suited to the ripening of wood and fruit buds. Where attention had been given early in the season, and no more shoots allowed to grow than were really necessary, sufficient would probably be so far matured before the dull weather not to be materially injured by it.

Trees shut-up at the beginning of December, and kept at from  $45^{\circ}$  to  $50^{\circ}$ , will now be in full flower if the wood was well ripened, and anything we can do to assist them at this unnatural season ought not to be delayed a day. It is not only this season's fruit we have to think of, for the permanent health of the trees ought always to take the first place in our thoughts. Everyone will allow that the act of setting the flowers is a great strain on the tree's energies; I believe it even greater than during the process of stoning, because at the time of stoning the trees are in thoroughly good growth, whereas at the flowering time they have scarcely commenced to grow, also there is generally less light and natural warmth to assist them.

Whether I am right or wrong in this, it is clear it is easier for a tree to set a hundred flowers than it is to set a thousand. There are many flowers so placed that if allowed to remain no fruit good for anything could be formed there, owing to want of space, want of light, &c. It is a good plan to begin by picking off all those that are weak or misplaced, or not accompanied by a wood bud, the backward ones, and those at the base of the shoots, thin clusters of blooms, and those on the weaker shoots severely, also thin the lower part of the tree and horizontal branches more than the upper portion; leave flowers on the upper sides of the branches and those at the extremities of the shoots in preference to those at the base; in short, leave them as much as possible where there is room, light, and vigour. Of course, I am supposing that the points of the shoots are well ripened, otherwise the blooms there will not be perfect, and must give way to those that are. Many will say, Leave all the flowers until you see which do set. That is not at all scientific gardening, and as I have already pointed out, more than half of them are useless if they do set. There is, then, evidently a chance to assist Nature, and she will amply repay in future seasons, if not in the present one. It is of no use to be timid about it; a timid man can never make a successful gardener. Of course, a due amount of caution is always necessary. I thin my flowers much more than I shall advise my readers to do at present.

The flowers that are left should not be tampered with in any way. They will always set naturally if they are healthy, and if they are not healthy nothing you could do to them would cause them to bring forth perfect fruit. They should always have air night and day from the time the buds commence to swell, and a temperature of from  $45^{\circ}$  to  $50^{\circ}$  at night and in dull days, allowing a rise of  $20^{\circ}$  or  $30^{\circ}$  by sun heat, with abundance

of air. Do not commence disbudding too early or too severely, rather stop the points of the shoots at first that you intend to take off. Give the border a stimulant in the shape of warm liquid manure, if it is at all exhausted, as soon as some of the leaves are grown to their full size. At any rate take care it is not at all dry inside. I do not advise surface-sprinkling of borders so often as it is usually done; it makes them sour and impervious to air. Once or twice a-week will be sufficient even in bright weather.

Finish thinning altogether when the fruit is the size of a small marble: it is not good gardening to wait and see which will fall at stoning. The same rule applies at this period as at setting the flowers. It is easier for the tree to form a hundred stones than to form two hundred; and if my directions are carried out as to thinning the flowers, &c., the fruit will not be so likely to fall at stoning. If any should fall after proper thinning, it is simply a warning that something is not quite right, and must be attended to before another forcing season commences. Probably a few broken bones and a little new loam would put all to rights.

It is important to bear in mind that the Peach will not be hurried during the stoning period; it will bear a good deal of forcing both before and after, but during that time fire heat should be used very cautiously.—W. TAYLOR, *Longleat*.

### CALADIUMS AND ALOCASIAS.

As ornamental plants, and from their fine habit and exquisite foliage, they are worthy a place in every collection of stove plants. No one shown through my stove but is filled with delight when seeing *Caladium argyrites*. It is indeed a gem from the banks of the Amazon. *Caladium Chantini* was thought beautiful, but now it is quite in the shade compared with the many varieties since introduced.

They are of most easy culture, and ought to be more largely grown than they are, as well as *Alocasia metallica* with its magnificent bronzy foliage—one of the most glorious stove plants that we have.

It has been said that they are so difficult to grow, and these notes on their culture are written to show how they may be grown from the time they are at rest till they unfold their beautiful foliage in the summer.

When they have shed their foliage place them in such a position that they may be readily examined. Give them just water enough to keep them firm; this is of great importance. The water should be of the same temperature as the stove. In some places it is customary to place them on shelves or under the stages till wanted in spring, hence the many failures. As soon as the first symptoms of growth are visible turn out the bulbs and carefully remove the soil from the tubers, clear away all decayed roots, and see whether the tubers are perfectly sound; if any decayed parts appear, scrape them away and apply a little powdered chalk. The compost should be good sandy peat and decayed leaf mould in equal parts, with a liberal addition of silver sand, a good sprinkling of charcoal broken-up finely, and old decayed cow dung, taking the precaution to kill all worms and insects. Give good drainage, cover it with a layer of turfy peat, and fill-up with compost, just covering the bulb, and pack the soil round it. Give a gentle watering just to settle the soil, and plunge the pots in cocoa-nut fibre refuse, temperature about  $65^{\circ}$  to begin with. Great care is required not to saturate the soil with water, but let it be given according to growth. I usually place a bell-glass over mine, it adds greatly to the beauty of the foliage, and when they have reached their full vigour take it off. They require shade during the hot sunny part of the day. Frequently give them liquid manure, they like it and make a splendid growth. I grow mine in a temperature of  $80^{\circ}$  to  $85^{\circ}$ .

*Alocasia metallica*, a native of Borneo, requires a compost of very rough fibrous peat mixed with a little well-decayed leaf mould, and a plentiful supply of sharp silver sand. The pots should be well drained, for although this plant likes to be freely watered whilst it is growing rapidly, yet nothing is so injurious to it as water stagnating about the roots. While young it should be grown under a hand-glass with the pots plunged in a bottom heat of about  $80^{\circ}$ . The atmosphere in which it is grown should be kept very moist, especially during spring and early summer. It must be shaded from direct sunshine.—F. P. LUCKENST.

DR. HOGG GRAPE.—I was very pleased on reading the account given by "J. W. O." of this fine new white Grape (see page 53).

The results there stated as being the produce of what is generally termed a planting cane grown in a 10-inch pot are a sufficient guarantee of the good properties of this variety. At any rate, the weight (8½ lbs.), and quality considered worthy of being placed on an exhibition table, are enough to stamp Dr. Hogg Grape as one of the best recent introductions, and one which I think Mr. Pearson, of Chilwell, has great reason to be proud of bringing before the public.

From the description given by "J. W. O.," it is quite evident that we may expect something from the variety in question when stronger Vines are grown. I was appointed one of the judges at a local show, and there, for the first time, saw this splendid Grape. On turning to my note-book I find that the dish of Dr. Hogg received the highest number of points given for White Grapes, with the following remarks:—Bunches 12 inches long, tapering; berries well set, of good size and excellent flavour. If "J. W. O." will allow me to take away the latter initial, and substitute Osberton in its place, I think it would have more influence with the readers of *THE JOURNAL OF HORTICULTURE*. I am led to make the above observation by the fact that the Grapes which came under my notice were products from those noted gardens, of which I think ere long we shall hear more in the way of Grape and other fruit-growing. —JOSH. JEFFERSON, *Carlton House Gardens, Worksop.*

### THE APPLE, AND HOW TO PRUNE AND TRAIN IT.

WHAT is "to prune?" To prune is to cut off or otherwise sever a limb or branch of a tree, and the object sought to be obtained thereby is the regulation of the vegetation of the plant. In the pruning of fruit trees we have a double object in view—first, the formation of the plant whilst in its young and growing state, according to some pre-arranged style or form; and secondly, inducing that plant to produce good crops of fruit. The treatment required for the one is necessarily quite distinct from that needful for the attainment of the other object, and will therefore be considered separately.

In pruning as applied to training, it may in the first place be remarked that the immediate effect of pruning or the cutting-off of any portion of a plant is the concentration of a greater supply of sap in the parts that are left—that is, the sap when it commences to flow, instead of having to be spread over the whole, is then all concentrated in the parts that are left. Hence by pruning we secure greater vigour and a stronger growth. This is more immediately applicable to winter pruning, or pruning after active vegetation has ceased. The result of all such pruning, it may be repeated, is to produce greater vigour. In this way, therefore, are we able to regulate by judicious pruning the growth of our trees. Be it understood that these remarks on pruning refer to cutting to buds that are in a condition to put forth shoots, and not to the amputation of limbs, as may be at times necessary as well. Bearing this in mind, therefore, it is apparent that if we want a particular tree or shoot to grow strongly we ought to prune it severely, and if a weak growth only is required then our pruning has to be reversed. Let us take, for example, two shoots on the same tree of the same season's growth, the one several feet in length and strong like a Willow, the other a weakly shoot of a few inches. The ordinary and natural plan is to cut the strong shoot back to the same length as the weaker, which is not pruned at all. This at the time of pruning gives the tree a uniform sort of appearance, but it is altogether wrong and extremely injurious. The weaker shoot should be pruned back so as to compress its forces on a few buds and induce it to put forth a stronger shoot, which it will assuredly do; and the strong shoot should be left at nearly its entire length, and, its forces being spread over many buds, it naturally breaks more weakly. In this way, by judicious pruning, we are able to encourage or repress the growths of our trees almost at pleasure, and so train or mould our trees to whatever particular shape or form our fancy may direct.

We prune our fruit trees in the first place for the training or formation of the plant, and we so train or form our fruit trees that they shall produce fruit. Now, it is of paramount importance in the production of a full crop of fruit that all the component parts of the tree be of equal constitution and vigour. If one shoot or branch be weak and the other strong, the whole strength in a short time, unless checked by judicious pruning, is absorbed by the strong shoot, and the result is not only an irregular but an unfruitful tree. The importance of pruning, therefore, as regards training is not

simply the ultimate form of the plant, but so to guide or direct its forces that the whole shall be equally distributed over every part of the tree.

To make my remarks and instructions clearly understood I shall give illustrations of the more particular acts of pruning and training at present practised.

Fig. 1 may be taken to represent a young or dwarf maiden Apple tree as it is called, just as it may be received from the nursery. It is the fashion now in this fast-living age to plant maiden fruit trees—i.e., one-year-old grafted trees, that have made only one growth from the bud or graft, and have not been pruned or manipulated upon in any way by the nurseryman. We plant such trees now, and have them in bearing long before it was even dreamed of sending them out of the nursery a few years ago. The fashion was to have trained trees and "cut-backs" so many times, in the belief that no one out of a nursery could perform such an action, I propose to explain all this from the beginning.

Let us suppose, therefore, that this tree is planted in the ground and has been planted there for some while, and now, February, it is time to prune it. In the pruning of this maiden shoot for the first time we, in a measure, start or lay the foundation of the future tree. It is therefore necessary to be particular and to determine beforehand what form shall be adopted. It may be laid down, in the first place, that no fruit-bearing shoot should be grown lower than 9 inches from the ground, but this can be varied if required. In pruning, therefore, for a low bush form we should prune to the third bud above the 9 inches, or above the mark where we wish the lowest

Fig. 1.—Maiden Apple tree as received from the nursery, showing the first cut in pruning. a, Graft.

Fig. 2.—Pruned as intended for a single cordon, two-thirds of its length. a, Graft.

branch to come from. From this cut we obtain three shoots all of about equal strength, which form the groundwork of the future bush. For a pyramid tree the same style of pruning is required, or perhaps, if the tree is strong, some five buds may be left beyond the lowest limit, the top bud in this case

producing the leading shoot, which being trained erect grows stronger than the other side shoots. We then have one leading shoot and four side shoots produced as the result of the first season's pruning. It is no matter what the strength of the stem may be, it must be cut down to the point stated in order to secure the branches or side shoots at the proper place. We can only, at this stage, depend upon four or five of the buds breaking, prune it where you will. If the stem is pruned at 3 feet from the ground the top five eyes only would break, and the lowest branch would then be 2 feet 6 inches from the ground.

Fig. 2 represents the pruning of a maiden tree for the formation of a single cordon. This may, of course, be trained either horizontally as represented, or upright. In this case no side shoots or branches are required, only buds for the formation of fruiting spurs; and so we are enabled to leave the stem at double the length, the top bud being the only one required to form a shoot.—B.

### THE POTATO DISEASE.

AFTER reading the report of the Judges, and their reasons for not adjudicating Lord Cathcart's prize to any of the ninety-four essayists competing, I think with Mr. Luckhurst (page 72) that they arrived at a most lame and impotent conclusion. There would, no doubt, be a great sameness in the different essays, both in the theories advanced and in the practical suggestions made to prevent the disease; but there must have been something worthy of publishing in the Society's Journal amongst the twenty-three selected essays, if not eligible for the prize.

In their Report the Judges say that the ninety-four essayists "generally consider it sufficient to assign a cause and a mode of prevention of the Potato disease, without giving any scientifically accurate theory of their proposed remedy, or sufficient experimental proof of the accuracy of their statements." Now, if some of the essayists have described what they believe to be the cause of the disease, and have likewise given a mode for its prevention, surely the lapse of more than twenty years is a sufficient proof that their theories and remedies have had time to be exploded if not accurate, and one of the conditions was that all prize essays shall be founded on experience or observation. No doubt some of the theories as to the cause of the disease and the practical suggestions as to its prevention made in these essays have been familiar to agriculturists and horticulturists previously, but if they have stood the test of practical experience so long they must be the best hitherto revealed, and the safest to rely on.

Another portion of the Report says, "As regards the botanical part of the subject, it must be confessed that all the essayists appear to be in the arrears of the present state of scientific knowledge." From this extract it seems that all the essayists were regarded by the Judges as not being up to the present standard of good botanists; but that botany has had much to do with the discoveries of the cause of the disease is doubtful, and the present state of scientific knowledge has as yet added very little to our knowledge concerning it.

The recommendation of the Judges to apply the £100-prize to some competent mycologist, so as to induce him to undertake the investigation of the life history of the *Peronospora infestans*, or Potato fungus, will if followed lead to no result. The life histories of the mildews or fungi which attack the foliage of the Pea and Turnip in dry warm autumns, and the Vine in spring and summer, must be known to mycologists before this; but despite the cures tried, the fungi regularly appear in the years when the weather is favourable for their development, and so it will be with the Potato fungus.

The recommendation of the Judges likewise to award valuable prizes for the best disease-proof early and late Potatoes is another ridiculous portion of their Report. These prizes are not to be awarded till after a three-years trial of the Potatoes entered, and they are to resist the disease, and must, besides, be of good cropping, keeping, and cooking qualities. The three-years trials will be so much time lost; for it will be found that none of the early and second early varieties are disease-proof, being only so when ripened in July and the beginning of August, before it usually appears. Even if some of the sorts escaped in a dry season, or in localities with a dry soil, they might become diseased in other unfavourable soils or seasons. As to the late varieties, it is only a few with thick, leathery, red skins, and strong woody haulm, that resist the disease the most, but they are not proof against it on

some soils, and cultivators of them know as much already about them as will be learned after a three-years trial. The handsome prizes to be offered for disease-proof sorts, to be raised from Potato plums, will, doubtless, be intended for seedlings of this section; but as it will be the spring of 1879 before the competition commences, the Potato beetle will be here by that time from America, and be a new enemy to conquer.—W. T.

WHAT Mr. Luckhurst says of blight-proof Potatoes being a fallacy, at least at present, is quite true; also that it would be a costly remedy for the Potato farmers of Lincolnshire and adjoining counties to discard old sorts for new. They have done so to a very great extent; Victorias, American Rose, and Regents fresh from Scotland being very largely grown; but I fear that though there is nothing like a change of seed for a crop, the result has not been to show much diminution of disease, especially in 1872. Mr. Luckhurst's opinion appears to differ from that of some of our new raisers as regards where we are to look for the remedy—viz., between the early and late sorts. In 1872 my Ashleaf, American Rose, Shaws, Nonpareils, and other early varieties were nearly annihilated, scarcely producing enough for seed, while Sutton's Flourballs kept growing till October with scarcely a tinge bad, the quality being what I once heard an Irishman describe as "buthery." Certainly some other late red sorts seem to have more power to withstand the disease than any early ones, from which I augur that some good late sort may yet be raised that will altogether resist it. I do not think that the disease is due to degeneration, for many of our recently-raised sorts are quite equal, if not superior in size, quantity, and quality, to any of their ancestors, and Potatoes grow as vigorously now as ever they did, those being the points in which degeneracy first shows itself. But we must first find what the disease really is before we find the antidote.—JOHN PLATT, *Gardener, Hillington Hall, Lynn.*

### THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 15.

MUCH that has been written of late years on the subject of Nature's mimicry, as it is called, appears to me to savour of the imaginative. No doubt there are protective resemblances traceable between some insects and the plants or other substances upon which they feed, or to which they resort. What has brought this forward more prominently is the circumstance that the upholders of the theory of evolution press certain of these instances into their service. After acknowledging that they are unable to explain the conditions under which a change in some species originated, they believe that by "natural selection" a mimicry occurring at first in but one, or at least in a few individuals, led the way to the development of a new type, and the continuance of that was insured by its close resemblance to an object which would protect it from danger. Now, it is quite evident that all these resemblances are not protective, and even those that are seemingly so have not quite the value sometimes assigned to them, curious and often beautiful as they are. Thus the large moth known as the "Red Underwing," sitting on the grey trunks of the Willows, with the under wings concealed from view, may be easily passed unobserved, yet it will not unfrequently sit on a tarred paling, or on a trunk or branch that has lost the bark, and then be visible enough. Mr. T. W. Wood asserts that butterflies have, in some instances, after they have gone into the pupa state, a peculiar sensitiveness of skin, so that the insect takes just the colour of the object to which the pupa is attached, very much as a photographic plate catches an image. He gives the common Nettle Butterfly (*Vanessa urticae*) as an example, and tells us that the pupae are of a greenish hue when attached to the Nettle leaves or stems, and more or less brownish if secured to palings and walls. Other entomologists have not found this exactness, and further observations appear needless ere it can be regarded as a fact. It is at least singular that Mr. Newman, whose knowledge of British butterflies is equalled by few, makes no allusion to so striking a peculiarity in his work on these insects. May not the truth be that we are going from one extreme to the other in the matter of natural resemblances? Our forefathers called these things simply "freaks of Nature;" we want to produce a "cut-and-dried" explanation of the reason of each, and with all our research must sometimes fail.

Hoping the reader will pardon this large introduction to a

rather small moth, I introduce a species commonly known as the Marbled Beauty (*Bryophila perla*), which is frequently to be seen sitting on garden walls towards the close of the summer. So nearly does the insect often resemble the wall when it is greenish white or grey with lichens, that I have observed persons be so close to the wall as to place a finger on it close to one of these moths, and yet not see the insect, which does not readily take fright. Nor does it soon catch the eye when resting on a paling, though if on a brick wall, if the usual colour, it is soon noticed. The wings, of a very light grey, have markings of a darker grey, many specimens, however, being found with the ground colour much darker, either greenish or brown—of course, according to the views of certain theorists these are intended to sit on dark-hued walls. At the base of the wing is a dark blotch, and beyond that a white bar; what are called the discoidal spots are large and irregular, and the fringe of the wings is prettily spotted with black and grey.

These little creatures are no wanderers, seemingly, from the home in which they have been reared; their life as larvæ and pupæ is passed upon the wall where we find the moths, and the latter seldom fly to any distance; indeed, I have never seen one take wing unless forced by alarm, when it can fly rapidly enough, yet settling again at the first convenient spot. It is worth anyone's while, in spring or early summer, to go to a wall on which he has seen the perfect insect and examine the crevices for the abodes of the larvæ. They emerge in the autumn from the eggs which have been deposited by their parents among the flat lichens so common on walls and build-ings, and after feeding a little they hide themselves in crannies, to remain inactive during the cold and wet season, each one, hermit-like, making arrangements to live alone, yet not exactly solitary, as his brethren of the same brood are all about him. Upon the arrival of the first mild days of spring these larvæ begin to feed again, always preferring those lichens that are saturated with moisture, and therefore usually engaged upon their food at morning and evening. Through the day they mostly rest in their cocoons, for even when larger they still follow the same habit of forming abodes of silk mingled with particles of mortar or moss, or perhaps with brickdust gnawed off the bricks by the busy jaws of the larvæ, as was observed by the late Mr. Rennie. They are often in crevices, or, if not, still so ingeniously made to resemble the wall, that it needs a little patience to discover them; and hence it appears that each time one of these larvæ leaves its abode it has to make a hole therein, the same being carefully closed again on its return.

Fig. 1.—Larva of *Acronycta Aceris*.<sup>+</sup>

Mr. Newman, writing of the habits of the larvæ of a species of the same genus, and closely resembling the Marbled Beauty, though not so generally distributed throughout England—namely, the Marbled Green (*Bryophila glandifera*), has stated as follows:—"It is curious, and rather opposed to the ordinary habits of insects in this respect, that, as a general rule, each caterpillar is totally careless whether he return to his own dwelling-place or to that of some relation; he will, without a moment's hesitation, coolly possess himself of any tenement he finds unoccupied, and, carefully closing the entrance, maintain his position against all comers. Supposing, however, that the tenement he examines, with a view of taking possession, be already occupied, he never presumes to intrude, never thinks of contesting the point, but continues to wander about on the look-out for a house until he finds one unoccupied; in no instance do two caterpillars attempt to occupy the same dwelling as tenants in common. Should a difficulty arise in finding an empty house, which not unfrequently happens, the caterpillar sets to work in the most contented manner to construct one."

The proceedings of *B. perla* are somewhat similar, and it is also observable in both species that the larvæ are reluctant to stir out in dry weather, and should it be long-continued, some of them die in their houses from starvation. The full-grown

larva is of a bluish or slaty colour above, with some irregular orange markings along the sides of the body; the legs and the under sides are green; the head is blackish and shining. Being mature, it then forms another cocoon, in which it becomes a pupa or chrysalis. A succession of the moths is to be seen most years, during about two months, in July, August, or September.

The cocoons of the moth bearing the Latin designation of *Acronycta Aceris* (see figs. 1, 2, and 3), and the English of the Sycamore Dagger, are to be found among garden rubbish near the roots of trees, and also on palings, for the larva has rather a propensity for wandering after it has ceased eating, and does not, as a rule, spin-up close to where it has been

Fig. 2.—Larva of *Acronycta Aceris*.<sup>+</sup>

feeding. One cause of its peregrinations are the high winds which sometimes prevail in autumn, and as this caterpillar is most partial to the higher branches of the Sycamore and Horse Chestnut, it is apt to lose its grasp and come to the ground with a sudden thud, rarely, however, seeming much the worse for its fall, owing to the protective coating of hairs. I have had this insect shown to me by gardeners as something remarkable, and certainly its aspect does distinguish it amongst hairy caterpillars, and it may claim the epithet "beautiful," while it is never common enough on those trees which furnish it with food to be deemed in any way an injurious insect.

The body of the caterpillar is flesh-coloured, but the most

characteristic peculiarity it has is a row of lozenge-shaped white spots along the back, eight of these having a velvety black edging. On each side, also, there are a series of pencils or brushes of orange-coloured hairs, while the black head has on it a white mark having a resemblance to the letter V. This caterpillar, which is about in August and September, if alarmed, at once rolls itself into a ring, the head, however, not being within the ring, as with some other caterpillars that resort to this mode of defence. I have never found the larvæ of this species make any attempt to bite, as do some of those belonging to the family of the "Daggers," though their jaws can scarcely penetrate the human skin. No doubt the hairs serve to protect the larva very effectively from the attacks of most birds.

The illustrious Réaumur repeatedly watched the larvæ of *A. Aceris* while engaged in forming their cocoons, and he perceived that by the time the task is finished they are almost entirely bare, the hairs being introduced at intervals among the silk. With his usual accuracy he notes the fact that though a larva pulled out the hairs in tufts, these were afterwards subdivided and distributed in smaller parcels, each being not simply entangled in the cocoon already partly spun, but secured by added threads. Quoting this account, Figuer, in his work on insects, remarks that "the operation must, without doubt, be painful to the poor animal." As to that effect, however, I hardly think we can speak so positively; the hairs mingled with the silk do certainly serve as a protection from the variable weather through which the pupa has to exist for eight or nine months. The Sycamore Dagger moth has grey wings dotted and streaked with black, specimens occasionally turning-up in which all the wings are of a dingy shade of brown.—J. R. S. C.

## MRS. PINCE'S BLACK MUSCAT—GROWTH OF YOUNG VINES.

I HAVE seen nothing to cause me to suppose that there are two Grapes in cultivation under the name of Mrs. Pince's

<sup>+</sup> From Messrs. Cassell's edition of Figuer's "Insect World."

Black Museat. It is far more likely that there is a right and wrong method of culture, and, as is usually the case, the majority of us have followed the wrong one. It will be interesting to note the effect of such alterations of treatment as the experience of the past season may suggest.

Permit me to remind Mr. Inglis that the canes of 25 feet long were produced by young Vines in about four months after they were planted, and as the tips of the canes were by that time nearer the bottom than the top of the back wall of the vinery, the eyes upon that part growing upon the trellis sustained no harm, but rather derived much benefit from the unchecked growth.

There can be no doubt that much mischief is occasioned by an indiscriminate application of the doctrine of close-pinching. Far better would it be not to touch any part of a Vine during the first season of growth in its permanent position, than to pinch and train with the precision that is so often practised. Let the roots and branches ramble as they may, we want no fruit, but growth that is lusty, stout, and strong, to establish the Vine, to impart to it a vigorous constitution, and thus lay the foundation of healthy and fruitful existence. It may be well to quote a case in point. Among a batch of forty or fifty Vines that once came into my hands to be planted in a new range of vineries, was a Black Hamburg of so weakly a condition that it was first of all put aside as useless, but as the roots proved to be healthy and the slender cane well ripened, I determined to afford it a corner. It was, therefore, pruned to within 2 feet of its base, and instead of being pinched like its more sturdy neighbours every shoot was encouraged to grow. The result obtained was remarkable and conclusive, for this weakly plant actually yielded four or five canes that were larger than many of the single canes of the, at one time, more vigorous Vines.—EDWARD LUCKHURST.

### MY SEED ORDERS—A RETROSPECT.

It is nearly twenty years since I first made out a seed order. I had then become "head man." How I had longed for the time, and promised myself what wonderful things I would do! I felt sure that I was in advance of the times, and would show how to strike out of the rusty old grooves that my hard-headed, grey-haired chief had moved in. To be sure, he was safe, there was no getting over that; but then what was it? Why, only the same things over again. True, we had always plenty of roots, and vegetables, and herbs. Onions never failed—no, never; but then we had only two sorts—summer and winter Onions; and at the same time we young fellows knew very well that they were nowhere amongst the new kinds—out of date, and would do very well for cottage gardens; but something different was wanted in a nobleman's place, such as more sorts to "follow one another," and not sticking to the common *6d.*-an-ounce things. And then the Beet—just the same one old sort. Of course, there was no complaint of colour or flavour; but then his lordship did not know what good Beet was—had only had this "old thing" all his life, which was not right, considering the splendid new sorts he ought to enjoy. We would have five or six sorts to "follow one another." Of course, that was the proper thing to do.

And then Lettuce. Just two sorts of that again, and only two. Such as it was we could always eat, summer and winter—indeed, it was one of the prides of our practical Yorkshire chief, as he said, "Nivver to be wihoot sallat." "Follow one another" the Lettuces certainly did by the surplus plants running to seed. But what waste! and how short-sighted not to grow all the new sorts which could hardly be made to run at all, the reason, as everybody knew, that seed was so dear! What better proof could anyone desire than that? And then their "nutty" flavour—what a treat it would be to his lordship, our sorts tasting of plain Lettuce, and nothing else! But his time would go and ours come, and we would then show the difference between fogeydom and progress.

Worst of all, however, were the Peas. I am afraid it made our blood crawl when we thought about it; and we were almost ashamed to admit the fact that in a fine four-aired garden were only three or, at the most, four sorts relied on to supply the regular great demand. It is true a few odd pints of new ones were obtained for trial now and then, and everybody could see their superiority but the "old fossil;" and then the three great bays would come as usual marked Early Frame, Champion of England, and Ne Plus Ultra, with a few quarts over of British Queen. Early Frame we knew was a long way in arrears as the times went, the new ones being a week or

ten days in advance, and we actually labelled it the "Old Snail;" and in the following May, and as if to make us ashamed of ourselves, the "Old Snail" gave us a good dish on the 18th day in the north of England, and it was seldom that it was after the 25th that we had to wait for a peck. Champion of England we had a little more respect for, it being in Bendigo's time, who had the "oracle of the ring" in the bothy, otherwise it was druidical, and not what the nineteenth-century Peas had come to. "Ne Plus" was very well; but row after row was surfeiting. We liked British Queen better, being so much sweeter to eat out of the pods as we gathered. No doubt we had an abundance of Peas to gather every day from May until severe frost set in; but then having the same old sorts over again was unbearable, and I think we added unprofessional. In a garden like that we would have fifteen or twenty varieties to "follow one another," and his lordship should have "the best" instead of being kept to the common ones year after year. The old chief had a regular crotchets about his Peas; and if he could not get the first sowing in on the 5th of November, not many things on the place were right, nor people either. On the arrival of this day we knew the order—it was probably forty years old. This was it exactly: "Na, lads, lets ha t'Peas in—it's t'fift agean. Git all t'labels written—three Frames, seven Champions, five Ne Plus, and one Queen, and that'll do for t'season. Av nivver been wihoot Peas i' all ma time, an' ha nivver sal be sticking to t'old sorts an sixteen savings."

Cauliflowers (including Broccoli) we had, in those days, "all the year round;" and of both put together we had never more than half a dozen what we called "paltry old sorts." Of Cabbage we had the ridiculous number of two, one of which has vanished off the face of the earth—no, catalogues—by its old name of Carver's Early. We thought it ought to have done that years ago. True, the old sloth would be ready to cut as soon as the Brussels Sprouts were over, but we knew the new ones were much faster than that; and how he should pet it by planting in a wood for seed three miles away from any of its congeners, we could never understand. We knew very well his object, because, as he said, "he muddent hev seed 'smittled,' as he sud nivver git another like it;" but that an old thing like that should be worth all the trouble was a mystery we could not fathom. Then we never grew anybody's "Fern-leaved" Parsley as we ought to have done. Certainly, we were never known to be short of a handful, and never heard the cook grumble once, but that was because she knew no better, and we longed to teach her what first-class Parsley really was.

At length the old chief was called to his fathers, full of years and honours, and never had the writer—he knows it now—a more trusty friend nor a more safe and reliable teacher, or his lordship a more competent and faithful servant. His motto was, "A few things and good to depend on, and of these a strong lot;" while for fancy it may be summed-up, "As many as you like, but not much of each." That was an old man's counsel. Let us test it.

As this, however, may stretch my letter to an inordinate length, I think I had better defer it till next week. In the meantime let me not be prematurely dubbed an old fogey prejudiced against all improvement, and an enemy to further research and further effort in any direction tending to advance horticulture, and to add to the benefits, pleasure, and interest of which it is an inexhaustible source. No; if I have read the Journal for over twenty years, and hope to enjoy the same pleasure over twenty more, I cannot admit myself an old fogey yet, but had rather be yeleft—AN OLD FRIEND.

### THE KITCHEN GARDEN.—No. 5.

It may be asked, What is the most desirable shape for a walled-in garden? I will endeavour to answer the question, though in doing so I may be unable to advance anything beyond that which practice has already taught most of us. The majority of those concerned know that a garden is walled-in for the purpose of not only securing increased warmth for the cultivation of early vegetables, but also, and principally, to afford a home for those tender and choice fruits which will not arrive at perfection without greater protection and heat than can be secured in the open ground. To prolong the ripening of some fruits and to hasten that of others are objects likewise to be considered. Although various forms have been advocated, not more than three or four can be recommended to the notice of those about to make a garden. There are gardens, it is true, of various irregular shapes; but as these result from the

inability to adopt a more desirable shape I shall not dwell on them, but will give outlines of those forms mostly adopted, and which the amateur will find can be easily applied to his limited scope.

*Fig. 1* represents a square with the walls at right angles, the four cardinal points of the compass being indicated, as in the other figures, by the letters N, S, E, W. Beyond the northern aspect, which is the least important, there are three other direct and most important aspects—viz., south, east, and west, of equal lengths. Now, as the sun travels from east to west, and the north wall faces due south, this will be exposed to the full force of the sun at mid-day, and the sun will play on the east aspect up to that time, and afterwards on the west. Before leaving *fig. 1* I may say it is sometimes better to alter the aspect a little according to the climate of the locality; for in 1860, when I had access to Thompson's "Gardener's Assistant," I made two or three extracts from it, which I will quote. In reference to this he says, "In the warm parts of Britain the wall on the north side should face the sun at 11 A.M., and the walls on the east and west sides should run parallel to each other and proceed at right angles from the wall on the north side. Where the climate is not quite so good the wall on the north side may face direct south, with east and west walls at right angles to it." If the garden is made of an oblong shape,

as shown in *fig. 2*, the southern aspect is considerably increased, and the east and west walls reduced. Gardens of such a shape are convenient, and often more suitable than any other. In colder localities such an addition to the southern aspect is very desirable.

I come now to *fig. 3*, which gives, besides a north and west wall, one that faces the sun an hour or two before mid-day. The chief object in this is not only to vary the southern aspect, but its position allows the sun to shine on the opposite side of the wall—that is, the north-west side, for an hour or two before it sets; but it is not a form that would commend itself for any other reason, and in squaring-off the quarters and borders there is a little waste of ground, as well as two or three triangular pieces, which are always awkward to cross.

*Fig. 4* is the same as *fig. 2*, only running direct north and south. Here the north and south walls or aspects are much reduced, and the east and west aspects of considerable extent. Gardens belonging to villa residences near towns are often of this shape, perhaps from the fact that they are easily formed, and there is no waste of space in laying out the ground. Narrow slips like these, if favourably situated, are about the best that could be chosen; but when a large piece of ground is enclosed in this way, the only means of increasing the southern aspect is to carry a wall across the centre from east to west; but for small plots it would not be a wise plan to do so, as the wall would take up room and shade the ground on its north side.

Considering the various points in favour of gardens of different forms, there appear to be none which would meet with such favour as a square or an oblong; for besides affording the most desirable aspects, there is economy in their construction and arrangement as well as in the after-management, and by very little contrivance they can be made to appear as ornamental as any other fancy form that can be devised with due regard to the necessary aspects for the cultivation of fruits. I therefore think I shall not be wrong in choosing the four figures I have given for my future remarks; and whatever may be omitted or not understood in this paper will, I trust, be brought out more plainly in subsequent articles.—THOMAS RECORD.

## ROYAL HORTICULTURAL SOCIETY.

LORD ALFRED CHURCHILL has sent for publication the following reply to the letter from Mr. W. A. Lindsay on the proxy question, which appeared in our last issue:—

"16, Rutland Gate, S.W., January 27, 1874.

"SIR,—In his letter, published in your impression of the 29th ult., Mr. W. A. Lindsay stigmatises as untrue the three following statements in the circular letter recently issued by Mr. Bateman, myself, and others.

"(1) That the Council of the Society have set the body of the Fellows at defiance in the question of voting by proxy.

"(2) That the same Council represent only the interests of the Fellows residing in the immediate neighbourhood of the Gardens.

"(3) That the same Council neglected to call the special general meeting of the Society for the purpose of considering the question of proxy-voting until after the time when it ought legally to have been called.

"The first of these statements may perhaps be considered a matter of opinion. A meeting of the Fellows was specially held for the purpose of considering a proposition to extend the power of voting by proxy to all Fellows of the Society. The meeting affirmed this proposition by an overwhelming majority. The Chairman then announced that the Council were not legally bound to carry out the desire of the Fellows, that they would take such steps as they might think proper, and would communicate them to the Fellows when they chose.

"In fear, apparently, of another resolution being brought forward in consequence of his announcement, the Chairman abruptly dissolved the meeting without even waiting for the customary vote of thanks. The Council have since taken no step to carry out the wishes of the Fellows. Whether they can be said to have set the Fellows at defiance is a matter of opinion.

"As regards the second of the statements objected to by Mr. Lindsay, it is a matter of public notoriety; and if Mr. Lindsay and his colleagues think otherwise, the sooner they are undeceived the better. Everyone in the Society knows that the old Council of the Society were disgusted into quitting their office last March by a vote of want of confidence, sprung upon them by a faction of the Fellows residing near the Gardens, who were dissatisfied because the old Council refused to make the interests of horticulture subservient to the wishes of that faction.

"The third statement objected to by Mr. Lindsay is fortunately a matter of arithmetic, and can be easily disposed of.

"By bye law 50 of the Society, the Council are bound to summon a general meeting within twenty-one days from the receipt of a requisition signed by twelve Fellows. The necessary notice was posted on December 2; the latest day, therefore, for which the Council should have summoned the meeting was December 21. The Council delayed the meeting until the 8th instant.

"I am, sir, your obedient servant,  
"ALFRED S. CHURCHILL."

*The Royal Horticultural Society as it is and as it might be. In some letters, by G. F. WILSON, F.R.S.*—This is a reprint of various letters Mr. Wilson has written on the lamentable state of the Society, and which had previously appeared in various horticultural periodicals.

## ENTOMOLOGICAL SOCIETY'S MEETINGS.

THE first meeting of the year was held at Burlington House on the 5th January, Professor Westwood, President, in the chair. Mr. Meldola exhibited a series of photographs of highly magnified insects taken by the microscope and camera obscura, and the President stated that a work had been some years ago published in Austria, in which the beautifully variegated wings of the Tephrites were represented of an enlarged size in the same manner. Mr. McLachlan called attention to a paper contained in the last part of the French Entomological Society's Annals, by Messrs. Bar & Laboulbène, on a South American species of Moth (*Palustris Laboulbenei*) closely allied to our Satin Moth, but of very extraordinary habits, the larva being aquatic, living in the canals of the Sugar plantations in Cayenne

and feeding upon an aquatic plant. The caterpillar is very hairy, and the supply of air necessary for its support was apparently entangled in its hairs, the larva breathing, in the usual manner of caterpillars, by means of small spiracles along the sides of the body.

The President gave an account of a small mass of cocoons recently found attached to a pot in which a Rose tree was growing, and which on being opened were found to contain caterpillars of the common Yellow-tail Moth, not more than a quarter grown; the cocoons, therefore, were only their winter quarters, and not the ordinary cocoons of the chrysalis. It was stated that the larvæ of the Satin Moth also spin cocoons in which they pass the winter gregariously. Mr. Stainton had likewise noticed that the larvæ of *Nepticula* were gregarious in the young state. Mr. Butler called attention to a memoir by Mr. Riley, the State entomologist of Missouri, U.S., on the American species of butterflies of the genus *Apatura*, and on the curious manner in which the chrysalis, instead of being suspended by the tail, is fixed against its support. A letter from M. Olivier was read, stating that he had recently come into possession of a portion of the collection of his grandfather, the celebrated French coleopterist, which was in good condition, and which he should be happy to exhibit to any entomologist who might be desirous of verifying the Olivierian types. Unfortunately the *Carabidæ* and *Longicornes* were lost.

Mr. F. Smith read a monograph on the wood-boring bees of the genus *Xylocopa*, and Dr. Sharp read descriptions of the *Pselaphidæ* and *Seydmonidæ* collected by Mr. Lewis in Japan.

The anniversary meeting of this Society was held on the 26th January, at Burlington House, the President being in the chair, when reports from the Council were read showing the satisfactory state of the Society, and especially commenting on the great value of the memoirs published in its Transactions during the past year. An address was also delivered by the retiring President on the recent progress of the science, which was ordered to be printed. On a ballot the following gentlemen were elected officers of the Society: Sir Sidney S. Saunders, President; R. McLachlan, Esq., Treasurer; Messrs. Grut and Verrall, Secretaries; and Mr. Janson, Librarian; and Messrs. Boyd, Dunning, F. Moore, and Meldola were elected into the Council.

### MILDNESS OF THE WINTER IN EAST LOTHIAN.

I SEND you herewith a bloom of Sweet Pea picked to-day (January 30th), in the garden of Mr. Dods, farmer at Congalton near North Berwick, where a patch of mixed Sweet Peas has been growing and flowering all winter, intertwined in a large bush of the common China Rose, which is thickly furnished with blowing and full-blown Roses; and both have afforded supplies of cut flowers up to this date. Here also a fine plant of Sweet Bay is now thickly covered with swollen flower buds, and the *Laurustinus* is clothed almost to snowy whiteness with fully expanded floral corymbs; these two, as well as the *Alexandrian Laurel*, being seemingly as luxuriant in growth as if they were in their native climes of Southern Europe and North Africa. In the surrounding fields and waste places many common weeds are flowering and seeding as freely as at midsummer, such as the common Sow-thistle and purple *Lamium*, of which sprigs are enclosed; as also the common annual *Fumitory*, Annual Meadow-grass, Chickweed, Groundsel, and many others.

In the pastures the Daisies with "their snawy bosoms sunward spread" contrast beautifully with the verdant grassy herbage. There also Buttercups occasionally show their golden heads. By the roadsides Dandelions are by no means unfrequent; while under the hedges those in some parts favourite spinaceous esculents, the common Nettle and Robin-run-the-hedge, are sufficiently advanced to be gathered for culinary purposes.

In the fields the Swedish Turnips and such of the few rough-leaved sorts that still remain are rapidly starting up to flower. Young grass almost entirely conceals the stubble of last year, and in many of the warmer-lying fields it already assumes the appearance of "windrolling" when passed over by gentle breezes. In the orchards the expanding yellowish buds of Pear trees are conspicuous; and still more, in the woods are the golden buds of the Balsam Poplar, and the silvery ones of the earlier Willows, the "siller saughs wi' downy buds" of Burns.

Congalton is on a low south-lying slope of that trap rock district in the north-east portion of the county which culminates in North Berwick Law, the Bass Rock, and other less

important eminences, and which is bounded on the east and north by the German Ocean and the broad estuary of the Frith of Forth. In its immediate vicinity "snabs," or small hillocks of trap, are frequently protruded, upon many of which the pretty Maiden Pink, *Dianthus deltoidea*, is remarkably abundant; and the Crow Garlic is so common that its root-bulbs, as well as compact cone-like heads of small hulsebels, are gathered for stewing and pickling.—WILLIAM GORRIE, *Edinburgh*.

### AGRICULTURAL RETURNS OF GREAT BRITAIN FOR 1873.

THE following are extracts from the Report of the Chief of the Statistical Department of the Board of Trade:—

As the prevalence of allotments is a subject of interest in connection with questions relating to the condition of agricultural labourers and artisans, the inquiry as to allotments was renewed in the present year, and made, as far as practicable, to extend to all garden allotments detached from the houses of agricultural labourers and artisans.

The return shows there were in 1873 as many as 246,000 allotments of land in Great Britain, of which 242,000 were in England, 1700 in Wales, and 2100 in Scotland. The practice of letting land in small allotments detached from cottages is not nearly so common in Wales and Scotland as in England; and even in England, as will be seen by the table of allotments in each county, allotments are comparatively few in the northern districts. Differences in rates of wages and of local agricultural customs affecting the support of the labourers, as well as in the number of small holdings above the size of allotments, are no doubt some of the causes that make garden allotments more or less numerous in different parts of the country.

The total extent of land let in garden allotments in Great Britain in 1873 was 59,631 acres, which shows almost exactly an average of one-quarter of an acre for each allotment, and the average for England is the same. The average size of allotments varies, however, in the different English counties. In twenty-four counties, in which there were altogether 122,000 allotments, the average size may be said to vary from one-eighth to one-quarter of an acre. In eighteen counties, in which there were altogether 120,000 allotments, the average size may be said to vary from one-quarter to one-half of an acre. One-eighth of an acre is the quantity of land usually considered as much as can be thoroughly cultivated by an employed agricultural labourer in his spare time.

The extent of arable or grass land used for fruit trees of any kind in Great Britain in 1873 was returned as 148,221 acres. This is a smaller acreage than was returned in 1872, but the decrease has chiefly occurred in consequence of incorrect returns under this head in previous years, in those parts of England where fruit trees are not extensively planted, and in Wales. The land returned as under fruit trees does not constitute a separate portion of the cultivated area of the country, as the greater part of land so employed is also returned as under green crops or grass.

The extent of market gardens in Great Britain in 1873 was 37,884 acres. Of this number 34,743 acres were in England—the counties of Middlesex, Essex, Kent, and Surrey, containing 15,542 acres, or 41.7 per cent. of the market-garden land in England.

Less land was planted with Potatoes in the United Kingdom in 1873 than in 1872 by 138,000 acres, or about 9 per cent. The decrease in Great Britain was 49,000 acres, and in Ireland 88,000 acres. The general failure of the crop in 1872 tended to diminish the cultivation of the Potato in 1873.

### A CENTURY OF ORCHIDS FOR AMATEUR GROWERS.—No. 19.

#### ONCIDIUM.

A FEW members of this extensive genus claim our attention in this portion of our task, although our prescribed numbers render it necessary that they should be few. In the present enumeration those kinds have been selected which are remark-

able for the beauty of their flowers, and which, in addition, are sufficiently low in price to bring them within the reach of all amateurs; and even with these restrictions I find there are numbers of beautiful kinds which have been passed over in silence; but the six species introduced previously, and those here enumerated, will be found a reasonable proportion for the Century, reference to which will be found at page 11, July, 1873. To speak in general terms, *Cattleya* treatment will suit the kinds named below admirably, and therefore it will be quite unnecessary to recapitulate.

**O. PAPILIO MAJUS** (the Butterfly Oncid).—It is a maxim with me that this should be one of the first Orchids for an amateur to purchase; certainly no collection, great or small, should lack it, and yet I was more disappointed when I first saw the bloom than with any other species I have seen; the fact was I had been taught to expect too much. Having early indulged in a passion for entomology by forming collections of the British Lepidoptera, I had become conversant with all the forms of our native diurnal species, and the flowers of the plant in question had been described to me by non-entomological friends as being a perfect representation of a large butterfly, so I longed for the time to come when I should feast my eyes upon this vegetable wonder. At length report came that in a garden some eight miles distant *Oncidium Papilio* was in bloom, and as soon as I and another young companion could get away we started off to see this wonder. In passing through the stoves and Orchid houses my brain was full of great gorgeous butterflies, and I was wondering how the lower side of the wings would differ from the upper side, when, to my utter discomfiture, I was told the flower before me was the veritable one we had trudged eight miles to see, and I had actually stood before it and not recognised the resemblance. Those of my readers, however, who may yet be strangers to this beautiful Orchid must not, however, imagine from the above that no similarity exists, for there is a striking likeness if a little imagination is brought to bear upon it; but from having imagined too much I was utterly disappointed, and I have always a vivid recollection of my feelings upon that occasion whenever I draw attention to this plant.

*Oncidium Papilio* thrives best upon a block of wood or cork, and should be well exposed to sunlight. The pseudobulbs are somewhat compressed, and bear a large, solitary, dark green leaf, which is brightly streaked and spotted with reddish brown. The flower spike is long and slender, and from its apex only the flowers are produced one at a time. The spikes should never be cut off until quite dead, for I have known them to continue to produce flowers from the same spike for two or three years. The sepals are long and narrow, standing erect like the antennæ of a butterfly; the petals are broad, and extend horizontally, whilst the large lip is supposed to represent the body; the ground colour is bright brown, transversely barred with rich yellow, saving the lip, which is yellow in the centre, with a broad marginal band of bright bay. Native of Trinidad, &c.

**O. AMPLIATUM MAJUS**.—A grand old inhabitant of our plant houses, and one that never fails to charm every beholder. It is a massive-growing kind, and to bring it to perfection should be cultivated in a pot. The pseudobulbs are large, light green, streaked and freckled with red and brown, bearing upon their apex a large, thick, bright green leaf. The spike attains a height of about 3 feet, and is much branched, bearing a profusion of large, bright clear yellow flowers, which on the reverse side are white. It blooms during May and June, and continues a very long time in full beauty. Native of Guatemala, Venezuela, &c.

#### VANDA.

There are but few species of this fine genus which I can conscientiously include in my Century, because the majority of them luxuriate in strong heat, although at the same time I am fully persuaded several others might be grown under similar conditions. I have previously recorded my dislike to fumigation for the destruction of insects amongst Orchids, and my experience goes to prove that it is one of the chief causes of Vandas losing their bottom leaves. Some of my readers may say, "But how are we to get rid of the horrid pest which lurks in the axils of the leaves, and turns them a dirty reddish brown? We may just as well lose our *Vanda* and *Aerides* leaves by fumigation as by the insect." For this, which is popularly known as the red thrips, we use tobacco powder; and if the amateur is a smoker, he may fumigate any particular plant when enjoying his evening pipe.

**V. TERES**.—A very distinct species, the stems and leaves being terete, rush-like, and dark green. The flowers measure from 3 to 4 inches in diameter, and some what resemble those of a *Phalenopsis* in shape; sepals and petals white, suffused with rosy purple; whilst the lip is purplish crimson, but yellow in the throat. Some varieties flower much more freely than others. It may be grown either on a block or in a pot; the latter will be found preferable if the plant is of any considerable size. It usually blooms about June, and continues long in beauty if kept from the sprinklings of the syringe. Native of Sylhet.

**V. ROXBURGHII**.—A species of great beauty, much neglected of late years, but really well deserving a place in even the most choice selection. It is a small-growing species, its two-ranked leaves being thick and fleshy, carinate, and deep green; sepals and petals china white, and prettily tessellated, the lip in one variety being blue, and in the other red. It blooms during June and July, and lasts long in perfection if the blooms are not syringed. I am particular in naming the syringe, because I have frequently noticed flowers may get wet without injury from condensation, but if wetted with the syringe they invariably become spotted and soon fade away. This species is a native of northern India.

**V. CÆRULEA**.—This is a favourite with everyone, and may be called a gem amongst gems, and, as I have before noticed, it grows naturally at a considerable altitude, and in a somewhat low temperature. I am of opinion that it likes plenty of

*Vanda cœrulea.*

light, a moderately cool temperature during winter, and a moist atmosphere all the year round. It should never be rested—that is, dried off, and requires the least possible amount of sphagnum or any other material about its roots. The leaves are arranged in a distichous manner, and are dark green. Spikes erect, bearing from six to twelve large flowers from 4 to 5 inches in diameter, and of a uniform lovely soft blue. It blooms at various seasons of the year, mostly during winter and spring. Native of Khasia.—EXPERTO CREDE.

### VARIETIES OF POTATOES.

I AGREE with the *Irish Farmer's Gazette* and the Rev. W. F. Radclyffe as to synonyms and pseudonyms, but must disagree with the *Irish Farmer's Gazette* in the list of synonyms given in the article "Old Friends with New Names" (see *JOURNAL OF HORTICULTURE*, page 55), and am glad Mr. Radclyffe has pointed out some of the errors. Without any divination, it may be considered that the basis on which the conclusions of the *Irish Farmer's Gazette* are founded were that of the trials in the "Chiswick Garden last year," and that the writer has no practical acquaintance with many, if, indeed, any, of the varieties of Potatoes in the list of synonyms. I have no desire to be hard on the Royal Horticultural Society, but cannot refrain from observing that whoever relies on so sandy a foundation for a list of synonyms must be prepared for the consequences; for the one object of a Society like this should be to prevent errors of nomenclature, and to keep down the varieties, as far as is consistent with the importance of the subject, to a reasonable number, giving no new, or alleged new, thing a certificate without proof that it is superior in quality and produce to existing varieties. The South Kensington establishment, as far as I can understand, is where the certificated varieties are manufactured *ad libitum* and *ad infinitum*, and it may be that any doubtful subject can be settled by the other establishment at Chiswick. No great harm will then be done; for though certificated at Kensington, it will be proved worthy at Chiswick or be found a synonym of some standard variety. It may be that a certificate incentive is necessary to induce the exhibition of new varieties, but that is no reason why a variety should one year appear as a certificated new thing and the next as a synonym. A certificate given anything means that it will be sent out at a price double or more than the double of that for which it would be if it were to be found a synonym, and I must submit that many of the errors in nomenclature, the multiplication of varieties, and the many worthless varieties existent are, in a great measure, due to the certificate principle adopted by the Royal Horticultural Society—the granting of certificates to subjects which only appear as selected specimens of what a sort may be brought to by culture and art, rather than as manifesting what the subject is under the general treatment of other kinds. Many subjects we happily do not hear of nor see named again after the year of their being certificated and distributed, and it would be well if no subject were allowed a certificate until it had been grown along with other standard ones, and found distinct and superior. No other test ought to be admitted with vegetables—they should be judged comparatively with other kinds, and they would then have given them what the public is certain to give them when the certificated or otherwise commended subjects come into their hands, after a comparative trial—commendation or condemnation.

I simply mention these matters, as they have long found a place in my mind among the impressions of the Royal Horticultural Society since the establishment at South Kensington. Horticulture has advanced, and will continue to do so independent of any centralisation of it in a society, but of that advancement very little of the solid part can be claimed by the Society outside Chiswick.

The best school of horticulture would be a large estate, established on the co-operative principle, cultivating fruits and vegetables for profit as well as the testing of new varieties, and then none but the very best kinds of either fruits or vegetables would find their way into private gardens. To Kew might safely be entrusted plants or floriculture and arboriculture, and with this and a national establishment, or even a private one, in so far as the money could be found from the private rather than public purse, dealing with fruits and vegetables, the Royal Horticultural Society might be let go, especially as it is a never-ceasing bone of contention over which no two agree. Disorder and disorganisation are but the forerunners of decay and dissolution, and to this the Royal Horticultural Society is advancing with blind measured steps. No

disinterested on-looker can fail to see the infatuation that prompts the two factions into which the members of the Royal Horticultural Society are divided—the desire for power; both studiously seeking the interests of the Society, and pursuing their cause with a vehemence that may hasten the inevitable day of reckoning. They pretend to uphold the Society which, as at present and for some time constituted, in no way promotes the interests of gardening or gardeners. Surely the fates have been against the Society since its removal from Chiswick to Kensington—the glory of the former being centred in the latter. Were Flora and Pomona to appear it is certain it would not be at South Kensington, except it were briefly upon some fête day, but at Chiswick amongst their devotees, old faces and true. Jealous indeed are the gods, and so is everyone in the horticultural world of the interests of horticulture.

The title of the article, "Old Friends with New Names," has led me to the above expression of my ideas of the Royal Horticultural Society. I will now proceed to express myself as regards Potatoes new and old, especially these mentioned by the *Irish Farmer's Gazette*. The onslaught is against "sixteen impostors with assumed names;" they being impositions on the Kentish Ashleaf. I could have understood this had they one and all been put down as Ashleaf, without the prefix Kentish. What is Kentish Ashleaf? Is there any difference between it and "Creper," a name given to the old Ashleaf on account of the tubers being produced at some distance from the stem on rather stout wires? In what respect does it differ from the old Ashleaf? I put these questions, for it is evident the *Irish Farmer's Gazette*, or its authority, has concluded that because some kinds are of one type, having originated from a certain variety, they are to be considered as synonyms of the original. In no other way can I account for the placing of Veitch's Improved Ashleaf in the company of Cambridgeshire Kidney. Last year "our best authorities" had found it identical with Gloucestershire Kidney and Royal Ashleaf, it not being, in my opinion, an improvement to place this very desirable kind—*i.e.*, Veitch's Improved Ashleaf—in the society of Early May, which is an inferior form of Ashleaf. Veitch's Ashleaf is a most desirable kind for forcing, in pots, pits, and frames, and it is, to say the least, straining a point to discover it is one year identical with Gloucestershire Kidney and Rivers' Royal Ashleaf—both of which are later by ten days to a fortnight, and have stronger haulm—and the next that it is Cambridgeshire Kidney, the Kentish Ashleaf.

Mona's Pride, happily, is so dissimilar to the "old familiar Ashleaf" that we may pass it by without comment, as no one who has grown the two—a thing, by the way, I may mention very few have—will ever agree to the synonym.

Up to this stage we have twenty pretenders for the honour of the Ashleaf, and it may be said of them all, one is as much Ashleaf as the other. They all show their parentage, and for ordinary purposes may be reduced to two, or at most three, kinds—*viz.*, Sandringham Kidney, the nearest to the original of all kinds named, notwithstanding that the *Irish Farmer's Gazette* sets it down as an imposition on Myatt's Prolific Ashleaf, the original name of Myatt's Ashleaf, which is ten days later—it is a very true stock of the old Ashleaf; Myatt's Prolific Ashleaf, or Veitch's Improved Ashleaf, the two being good croppers, and very good in quality, will succeed the Sandringham. These three are the best of the Ashleaf type, Myatt's having its tubers close to the stem, whilst Veitch's are produced on rather long wires, but gives a more even-sized tuber.

We now come to Lapstone, no more variable Potato known, so that we need not wonder at the number of synonyms. I could in any year put forth half a dozen from a selection of the true kind. It sports more than any other sort, and the kinds named as originating from it are all of them inferior, if we except Yorkshire Hero, which undoubtedly is a fine Lapstone, in no way inferior to it. Originating from the Lapstone by seed, it is not nearly so variable as the Lapstone, but, nevertheless, has all the characteristics of the Lapstone, it not being free from reverting to the Copper-nosed Kidney from which the Lapstone is derived. Huntingdon Kidney and all the *aliases* have more of the Copper-nosed Kidney blood than of the Lapstone, not one at all comparing with the Lapstone for quality. They are all too much nose, and heel too long; the Lapstone, though flat, being a bulky Potato, with very little difference between the rotundity of the nose and heel. The Yorkshire Hero has a better constitution, hence succeeds on soils from which the Lapstone is driven by their wetness and closeness. To keep the Lapstone true the

seed (sets) should be very carefully selected, choosing those that have the greatest rotundity, and have the ends as nearly alike as possible, rejecting those with thick noses and small tails, and this persisted in annually will keep the Lapstone very select. Than the old true Lapstone there is no better kind of Potato as a second early; but to say that all the varieties given at page 55 are synonyms of the Lapstone is decidedly wrong. Of the Lapstone race they are, and degenerate, but all are distinct from the Lapstone, which nine-tenths of those under that title are not. No variety, as before stated, varies so much, no kind is so difficult to obtain a break from seed. The seedlings all run back to the Copper-nosed Kidney, or have great length with flatness. Only once have I made sure of a break. I have at last a Lapstone with a rose skin, the tubers being long, flat, curved, thick nose, small tail end, double the size of the parent, with a thick sprout, purple and stout; haulm weak, erect, more like that of a round kind than a kidney, and though a late kind in sprouting, not needing to be planted on that account before April, or even May. It ripens with the second earlies, and when the disease is severe sheds its leaves, and escapes it. It will suit the Royal Agricultural Society: the *Irish Farmer's Gazette* will not treat it, because of the Lapstone race, as a synonym of that variety.

Regent is made the same as Early Oxford. It is time to give in, for they are as diverse as any two round Potatoes will can be, and I should not trouble about it except to say that those wanting a good Regent will find it in Walker's Early, which beats the whole of the Regents, being earlier, with a stiff erect haulm. It would be a happy union of blood whosoever might give the earliness of the Early Don and a touch of its pink eye to the Regent.

Red-skinned Flourball I must confess to being deceived in. I had what I thought was it, but discarded it from its being a "Soapball," when last year I had some Red-skinned Flourball sent me. They were very different from the other, having shallow eyes and a rough skin, the first having deep-sunk eyes and a smooth skin. I have at last the true sort as originally sent out by Messrs. Sutton & Sons, Reading; and though it boils well now, cooked in the oven or roasted it is better. The American Red is not Red-skinned Flourball nor Boston Red: both are the same as I had at first—what the *Irish Farmer's Gazette* may know, if it can reach back to the time of the disease becoming general in 1845, as the Irish Cups, and well the eyes resemble cups.

I have no seedlings to recommend, though I have one or two for the Royal Agricultural Society ready now, and may in 1878 have more that no art of man can prevail against by persistent bad cultivation with disease. I do, however, recommend the old Ashleaf Kidney, its improved form, Myatt's Prolific Ashleaf, Lapstone, and a round flat sort, Paterson's Victoria, with Walker's Early Regent, and Red-skinned Flourball, making sure that you have it, and New Hundredfold Fluke, the latter a piebald sort, and with the next preceding a late good keeper. I am also glad to verify the statement of "D., Deal," that they are not subject to nor have had disease.

Just a word about Willard, a red-skinned sort that boils beautifully white, and is excellent both in cropping and quality. Excelsior is a fine white sort, round as is Willard, and both have dwarf haulm—the very type of haulm we want, but lacking the woody character of Hundredfold Fluke and Red-skinned Flourball. I have some seed from Excelsior, from which I hope for much.

Mr. Luckhurst is disappointed at the result of the Potato essays, no prize being awarded. I agree with the finding of the Judges, but I do not agree with the "blundering" policy of the Royal Agricultural Society. If the essays were not worth the £100 prize, surely the Society ought to have been above saving themselves £100 to offer in a prize for that which the essays did not contain. The essays have had taken from them their substance; a basis for the Royal Agricultural Society to act upon has been given; and I am sure none of the essayists will begrudge the time and labour expended if only the result be the improved cultivation of the Potato, which, however, the Society ignore, choosing rather to seek for disease-resisting new kinds to battle against the present mode of cultivation, which it needs no one extraordinarily endowed to discern, is with the Royal Agricultural Society perfection. Go on, Mr. Luckhurst, cultivation is more at fault than the Potato; but make it good as you may, the fact remains that whether the treatment be good or not, there are conditions attending the culture of the Potato over which the cultivator has no direct or certain control—in other words, Potatoes are diseased under the best

cultivation, as I contend they have been for a very lengthened period, if not through all time.

We want hardier-constitutioned kinds of Potatoes—kinds that will endure the vicissitudes of our climate; kinds that by bad cultivation as for centuries practised will not become diseased; kinds that are disease-resisting, mere waxy lumps of matter as yet, but which we all of us wish to see floury, suited alike to the Royal Agricultural Society and the consumer. It is about as likely we shall have disease-proof Potatoes in 1878, and continue the present general cultivation, as we shall then enter on a period of uninterrupted prosperity and peace.—A.

## CHATSWORTH,

THE SEAT OF THE DUKE OF DEVONSHIRE.—No. 1.

CHATSWORTH is a hamlet of Edensor parish, about nine miles from Chesterfield in Derbyshire; it was known in Norman times as Chetesworde, and belonged to the Crown, though it was in the custody of William de Peverel, ancestor of that "Peverel of the Peak" Sir Walter Scott has celebrated. From the Peverels it passed to the Lecho family, so named from their ancestor being the king's leech or surgeon. From thence it passed to an Agard, who sold it to Sir William Cavendish, and it has since remained in the possession of his descendants. He married the well-known heiress of Hardwick, and thus became the chief of the Derbyshire aristocracy. He began to erect a noble mansion, but dying before even one of its wings was finished, the completion devolved on his widow, who by her fourth marriage became Countess of Shrewsbury. That building did not satisfy the first Duke of Devonshire, so he began (in James II.'s reign) to reconstruct it. This was in 1687, and the mansion was finally completed as it now appears in 1706.

What memories, associations, and reflections crowd on one's mind at the mention of this place! No need to couple with it the claptrap name of the "Palace of the Peak," a name which certainly gives one the notion that towering above its stately halls is to be seen the picturesque mountain bearing that appellation, instead of its being some fifteen miles away. No need to tell a gardener at least of the number of its rooms, the size of its halls, the costliness of its decorations, or the value of its paintings: to him it speaks of something above and beyond all these. It was the home of Paxton, the place where the Victoria regia first opened its beauties in England, where the house is now so celebrated as the model of that glass palace to which all the world was attracted in 1851, and which now crowns the heights of Sydenham—one of the chief sources of pleasure to an overgrown metropolis, and in addition to all this still the home of many a rare plant, and the place where all interested in our beloved pursuit may find amusement and instruction.

It was with some such feelings that I turned aside on my way to the great Manchester Exhibition in September last to pay a long-promised visit to Chatsworth. It had for many a year been treasured up as a treat in store, and now that it has been enjoyed the memory of it will cling to me as one of those bright days in the calendar *creta notanda*. It was a lovely evening when I found myself at the Rowsley station, and there being no bus for more than an hour, I started off for a most lovely walk to Edensor. It was moonlight before I reached the village; and the splendid foliage, the calmness of the night, broken only at times by the deer as they bounded through the bracken, tended to make the walk most enjoyable. The hotel at Edensor is charmingly situated, and I am bound to say I was as comfortably lodged and taken care of as I could have been at any west-end hotel, but truth compels me also to say I had to pay quite as much for my accommodation as I had at the "Langham" a week before. The whole aspect of the village suggests to me the thought, that of all forms of society the feudal is (when the carrying-out of it is complete and the head of it considerate), that which ensures the best results; just as of all forms of government despotism, if the despot be truly the father of his people, is that which secures the greatest happiness. Here at Edensor you have the very ideal of a village: the houses all so beautifully built and the gardens so well kept, the church and school standing in the midst of the people, that but for that most disturbing element our poor human nature, one might suppose that this must be the abode of contentment and peace.

On the following morning, in accordance with a courteous invitation from Mr. Speed, the able gardener at Chatsworth,

I walked over to the house, not for the purpose of viewing the interior, but of seeing the grounds and gardens. And now how shall I venture to attempt any description of the varied beauties and immense collections of this wonderful place? But in looking round I came to the conclusion that there were two specialities of the place which in their way are unique, I mean the grand Palm House and the Victoria Tank House. "Unique!" some one may say fresh from reading the glowing description of the Palm house at Kew in the "Edinburgh." Yes, unique; for while both are Palm houses they are essentially different. It seems a necessity of a public garden that artistic arrangement must give way to utility. It is not arranged for the pleasure of few or many, but for the benefit of science and the world at large. Now science scoffs at art. What are all the glories of pencil or taste of arrangement com-

pared with the gathering of one scientific fact? And so Kew Palm house, while possessing many noble specimens, is to the general spectator inaudibly, dirty, and inartistic. Happily at Chatsworth it is the other way: science is not, as we know from its records, neglected, but taste predominates. Where in a public garden, for instance, could be arranged that cross avenue of Musas which makes one almost fancy oneself in some tropical forest? Look, too, at those grand hanging baskets, suspended all along from the roof, 5 feet in diameter, and filled with Achimenes crowded with their lovely flowers and hanging over on all sides of the basket. I never believed this plant to be capable of such things until I saw it here. Again we come on a forest of Agaves, suggesting at once Mexico. Then look at these noble specimens flanking the centre walk; *Chamærops*, *Phoenix*, *Livistona*, and other Palms

CHATSWORTH.

towering up to reach the lofty roof. Here, again, are fine plants of *Cycas revoluta*, and in another place a charming rockery from which a cascade falls, and around which tropical plants send forth their lovely foliage. But stay, what is this?—that brilliant scarlet flower displaying itself some 8 or 10 feet up—can this be the puzzle of many an Orchid-grower? Yes, it is *Remanthera coccinea*, at which many a good gardener has shaken his head and said he could do nothing with it. Mr. Speed, however, has found out the way to make it display its beauties. He placed a green pole in the Palm house, planted the *Remanthera* close to it, up this it climbed and flowered; then another higher pole was placed near it, and then a third, so that now it has run up about 10 feet, and displays its brilliant coloured flowers most profusely. It is a triumph of good culture, of which Mr. Speed may justly be proud.

Stove climbers have here an opportunity rarely afforded to them. We see *Allamandas* confined in pots, or else allowed a single rafter to climb upon; here they wander at their own sweet will, and most lovely objects they make, their rich golden blossoms showing themselves most conspicuously. Tree Ferns, too, have a grand opportunity of displaying their beauties, and the whole aspect of the house is one of ever-changing and varied beauty. Nor will the gardener who is botanically inclined or fond of curious forms be at fault. There is a fine collection of *Cacti* ranged along the side of the house, and many rare

forms of *Agave* and *Beaucarnea* scattered throughout it; while lovely masses of *Adiantum* on the rockwork, and other Ferns, relieve by their tender and elegant foliage the more rigid forms just enumerated. Altogether this Palm house is a thing of beauty on which one delights to dwell, and which must be a great source of pride to the gardener in whose charge it is.—D., *Deal*.

#### MY BIRD DIARY 1873.

IN May last, when I sent you my bird diary for the first part of 1873, I promised to send my report again at the end of the year, but I have so little of interest to chronicle, that, had it not been for my promise, I should hardly have ventured to trouble you with the following lines.

*July*.—I mentioned that in May several cuckoos were constantly in my farm garden, and that they kept down the grub which devours the leaves of the Gooseberries; as a rule they disappear at the end of June, indeed so regularly that there is a saying in these parts, that "the cuckoo always buys a horse at Pershore Fair (the 28th June), and rides away." One, however, a full-grown young bird, was left behind this year, and I saw him frequently till the 14th July, when he

From a photograph by Mr. Clarke, Photographer, Matlock Bath.

finally disappeared. He was very tame, and would allow me to come within a few yards of him.

Up to the middle of the month we had been unusually free from blackbirds; we had only our own home-bred birds about, and we did not much object to their helping themselves to fruit. There was plenty for us all; but one morning, about the middle of the month, when I went out, I saw the Raspberry bushes in a state of agitation. They were shaking about without any apparent cause, but on going nearer to see what was the matter, about twenty blackbirds fled out of them, and as many more from an adjoining plantation of Red Currants. The case was evident enough: my neighbours' blackbirds, having finished the fruit at home, had come and quartered themselves on me. Others came to join them, till the garden was full of them. We shot at them, we tried to drive them away with dogs, by shouting, by throwing stones, but to no purpose; at last they would not even rise, but sat there, hiding themselves in the foliage, twittering and laughing at us. They finished the Raspberries and Currants; then all the Gooseberries which were not covered; then the early Pears; then they set to work at the Plums, preferring the Victorias to all others, but when they were finished, taking any that were left, ripe or unripe—all was the same to them; then they finished the Mahonia berries. Then they disappeared for a time, returning about the middle of October, to eat the windfalls from some perry Pears. This done, they left us for the winter, and returned to their own homes. They were assisted by a pair of missel thrushes and a few song thrushes; but these last are by no means so bold or so voracious as their kinsmen.

In *September and October*, beyond the raids of blackbirds mentioned above, I have little to chronicle. We had a passing visit from blackcaps and tomtits, which took a few of the tender-shelled nuts—Cosford I think they are called. The birds always take these nuts. The tomtits, too, stocked a few of the Pears, but did far less damage than in some previous years. About the end of the month the Apple and Pear crop was gathered and stowed away, and, as I vainly hoped, was safe against the incursions of enemies; but in this I was mistaken. On going to look at my fruit one day, I found large slices taken out of the best specimens of Pears, and on examining the fruit there could be no mistake about the perpetrators. The rats had got to them. These voracious brutes seem to swarm in every part of the country to an extent which never was known before. I expect that the destruction of stoats and weasels by game-keepers has much to do with their increase; I believe, even from their own point of view, keepers would be gainers if they preserved the weasels, at any rate for some years to come, for the rats are great destroyers of eggs as well as of young rabbits, and are very difficult to catch, as I can testify. They have sealed the walls of the house by means of the Ivy, got into the roof in some way we cannot discover, and have destroyed the best of the fruit which was stored there. We can hear them at night, knocking down the Apples with a bump from the shelves on which they were placed, and then rolling them along the floor to some part where they stow them away. We dare not poison them, for in this case they prove greater nuisances in their deaths than in their lives. We have tried traps of all varieties, but though we have caught a few, we cannot get rid of them altogether. I have discovered, however, that they can be driven from any particular run which they frequent by pouring gas tar into it, for rats, though living in and upon every kind of filth, are very particular about their personal cleanliness.

In *December* the only stray birds which I noticed were a family of bottle tits, which, as usual, made but a passing visit; and a few solitary cock bullfinches. Our birds are now reduced to about the original stock with which we began the year, with the exception of the starlings, which left us in the summer, and probably were killed in some of their plundering expeditions. We have a few blackbirds and thrushes, robins, hedge sparrows, chaffinches, wrens, house sparrows, and yellow-hammers.

I may venture, however, to say a word or two on the *Wild Birds' Protection Act*, which prohibits the killing of certain birds during the breeding season—from the 15th March to the 1st August, yearly. The list of protected birds seems to have been drawn up with great care and knowledge of their habits. The only names I could wish to see added to the list are the chaffinch and the linnet, but I suppose many gardeners would object, as they are undoubtedly troublesome in devouring the newly-sown seeds; but I think all the omissions of the

Bill are judicious. The starling, for instance, is one of the greatest thieves we have for certain kinds of fruit. It is particularly fond of Cherries, and your readers may imagine what chance a grower of Cherries would have of a crop, when I mention that in one large orchard in this county I am informed that more than one thousand starlings were killed. They came in large flocks—two or three hundred at a time, and settled on the trees, and would soon have stripped them of all their fruit if they had been unmolested. Blackbirds and missel thrushes are also rightly omitted, for they are omnivorous as far as fruit is concerned, and are so bold, and have such enormous appetites, that it is necessary to wage war against them; but I must confess to a weakness for the singing thrush, and could wish to see his name inserted in the protected list. The bullfinch again is most properly omitted, as he is most destructive to the tender buds, and, as I mentioned in my last notice, he lives on them, and not on any grubs they may be supposed by charitable people to contain. The house sparrow, too, though at times he is very useful, is at other times so destructive that he is fairly exempted from protection. The same may be said of the magpie and jay, and even of the rook, which, though most valuable in the spring, requires to be kept at a distance in the fruit season, as he, too, has a particular weakness for Cherries and for Walnuts. On the whole, I think the Bill has been most carefully drawn. The insect-eating birds, as a rule, are protected, while the fruit and grain devourers are very properly left to take care of themselves.—*WILLIAM LEA, St. Peter's, Droitwich.*

## NOTES ON VILLA AND SUBURBAN GARDENING.

WHEN the weather is not very inviting for out-door operations, advantage should be taken of it to regulate the greenhouse and frame plants previously to commencing their spring growth. That the health of plants as well as of animals is materially influenced by cleanliness is evident from the difference between the growth of the same species in the country and in the smoky atmosphere of large towns. In the country plants grow with vigour, whereas in the town, although enjoying the same advantages as to soil and water, they only drag out a miserable existence. This is caused by the respiratory organs becoming choked by the accumulation of dust on the foliage; and as the plant is thus unable to breathe, some derangement of the system must be the result. In the constituent parts of the atmosphere the most delicate analysis has failed to detect any material difference between that of densely populated towns and open places, but that it is less transparent is obvious to those who have ever observed it from a distant eminence. There is no doubt, therefore, that the want of light and the dirty state of the foliage are the principal reasons why plants do not thrive in towns; but the success that has attended their cultivation in Ward's cases proves that they can be grown in such situations, provided they are kept clean, have all the light that can be procured, and are not parched-up by a dry atmosphere, for it is to keeping plants free from dirt and to supplying them with an atmosphere containing moisture proportionate with the temperature of their habitations, that we may attribute their successful cultivation in glazed cases. From the above observations the window gardener will see the necessity of keeping his plants clean, especially in dull weather, and the possessors of framea and greenhouses the propriety of washing the glass frequently. In regulating the plants it will be well to wash the foliage of Oranges, Camellias, and other smooth-leaved plants with a sponge and clean water, and the dust may be removed from Pelargoniums and other woolly-leaved plants by brushing them lightly with a soft brush. After the plants are cleaned the pots should be washed, and the surface in each replaced with fresh soil, and if they require it they should be neatly tied to fresh stakes. It is not an uncommon occurrence to see a stick as thick as a man's thumb supporting the delicate stem of a Calceolaria, or forming part of a trellis for a fragile and elegant climber. This is bad taste; and it should be recollected that as a support of this kind is only a necessary evil, the more slender the sticks are the better.

Carnations, Picotees, Auriculas, and Polyanthus in framea should have all the air possible in mild weather, but they must be protected from wet. It is a good plan to have the frames raised upon a brick placed beneath each corner, with moveable boards to fit round it, so that they may be let down in mild weather to admit a current of air among the plants, and be replaced in case of frost. Remove all decaying matter, so as to keep the atmosphere within as pure as possible, and prevent the attack of mildew on the plants.

Where the first sowing of Peas is coming through the grounds it will be advisable to draw a little earth to the plants. In case of mice attacking them, I know of no better plan than trapping them; that called the figure-of-4 trap, a number of which can

soon be made, may be employed. Dig vacant ground, as all soils, but especially such as are of a clayey nature, profit much by being fully exposed to the action of frost, which has the effect of rendering them friable and easy to work. Let the pruning of all kinds of fruit trees be finished as soon as possible, and forward every operation that can be done with advantage now, as the most busy period of cropping is fast approaching.

As a suburban garden will only contain a comparatively limited number of plants, it is a matter of policy to have the majority of these evergreens, that in the winter season, when all else is so dreary, it may wear a moderately green and cheerful appearance. Of these such as bloom gaily and abundantly, and particularly such as blossom in the winter, or bear showy fruit at that time, or have variegated foliage, should be selected as tending less to create sombreness and gloom; and combining the elegance of their flowers or their appearance with the permanence of their leaves, for that purpose we would recommend the various sorts of Holly, the double-blossomed Furze, several kinds of Broom, *Garrya elliptica*, *Rhododendrons*, *Andromeda floribunda*, *Berberis Aquifolium*, *Cotoneaster microphylla*, numerous Heaths, *Kalmias*, *Rock* and *Sun Roses*, *Gum Cistus*, &c.

Although evergreens may fitly thus prevail in a small place, it will be unwise to cultivate them to the exclusion of deciduous shrubs. The latter, by their lighter foliage and sprightlier manner of growth and showier flowers, seem to be the natural bodying-forth of summer's richness and gaiety, and this glorious season would scarcely appear rightly attended and adorned without them. They are, indeed, as thoroughly the life of summer, as evergreens are of winter, and, perhaps, of the two the absence of winter's decorations would be even least regretted by the mass. Cuttings of shrubs may be put in during February. Let strong shoots of last summer's growth be selected. Choose them from 9 to 15 inches long, and, if you can, take about 2 inches of the old wood with the shoots at their base. Trim-off the lower leaves, place the cuttings halfway in the ground, and plant them in a shady border to root. Do this in February in preference to October, as everything roots earlier from spring operations. You may also plant cuttings in June, but keep them moist and shady. In pruning shrubs be careful to cut-out the long rambling shoots of the last summer's growth, which disfigure their appearance; cut away also branches of shrubs which interlace each other, that every shrub may stand alone and well defined. Take away their suckers, and let each shrub be kept to a single stem.

*Laurestinus*, *Phillyreas*, and *Laurel* are excellent shrubs to plant near buildings or to hide a wall; they are evergreen summer and winter, very hardy, and quick-growing. The *Pyracantha* is an elegant shrub with its clusters of red berries, and it looks gay during the autumn and winter. The *Arbutus* or *Strawberry Tree* is loaded with its Strawberry-like fruit in August, September, and October. This is a beautiful shrub placed singly on a lawn, if kept to one single clean stem and a fine branching head. *Portugal Laurels* are beautiful, their deep green leaves and scented feathery flowers make them an important shrub in all gardens.—W. KEANE.

## DOINGS OF THE LAST AND PRESENT WEEKS.

### FRUIT AND KITCHEN GARDEN.

In every garden where the importance of having in a forward state all out-door operations, such as pruning, digging, trenching, and making alterations, is a primary consideration, there will now be little of that work left undone. In our own case all such work has been pushed forward, but, on the other hand, much that used to be done in frosty or wet weather, such as Strawberry supports, pegs, *Pea sticks*, &c., has yet to be attended to. Where *Pea sticks* can be obtained in abundance it is as well to have them new every year, as the small sprays to which the tendrils of the *Pea* cling are broken off during the winter; but the old sticks can be used a second time if new sticks are mixed with them in about equal proportions. Where *Pea sticks* have to be cut, it ought to be done at once, and they should be pointed. This is best done when they are freshly cut; a man can do more work, and that with more ease to himself, than when the wood is dry and hardened. It is also desirable to size them. The dwarf-growing sorts, such as *Tom Thumb* and *Blue Peter*, though they will do without sticks if these cannot be readily obtained, will be all the better of sticks 15 inches long. The largest proportion of them will be 4 feet long. A sufficient quantity must likewise be prepared at 6 feet, for *Ne Plus Ultra* and allied sorts. It facilitates operations at the time of using them if they are tied-up new in suitable bundles. We prepare elm or hornbeam sprays about a foot long for Strawberry supports; about three or four sprays are placed round each plant.

Seeds that have been sown are vegetating freely. Peas are up nicely, but the birds and mice are at them, the latter before they are through the ground, and the former as soon as the tender growth can be discerned. Mice are caught with a figure-

of-4 trap, an arrangement which has been described in this Journal, and in which a brick falls and crushes the animal at once. For the birds nothing answers better than the *Pea* protectors advertised weekly; these are placed over the rows as soon as the *Peas* come through the ground.

Planted-out the *Potatoes* on an early border; the sorts are *Myatt's Prolific Ashleaf*, and *Veitch's Improved Ashleaf*. The ground is in excellent order. The sets had been spread-out on the floor of a loft and have sprouted a little, but being carefully removed without detaching the sprouts, there will be no check to the growth. Many persons plant with a dibber; one man makes the holes and another follows and drops a *Potato* into each: this is about the worst method possible, especially if the ground should be wet. A better way is to draw drills with a hoe and plant the sets in them; then, should the ground not be in good order, a little dry light mould can be placed over the sets. Ours are planted with a spade or digging-fork. The ground had been prepared by digging and manuring early in the autumn, and as it is now lightly dug or forked over, the *Potatoes* are planted so that the ground is left loose.

### FORCING HOUSES.

*Vineries*.—Some of the best *Grape-growers* complain that their *Vines* are not starting strongly this year. Last season was not favourable to properly ripening the wood, and this is, no doubt, the cause of any weak or uncertain growth in the present year. In our own earliest house the *Vines* are starting very regularly, and the growths are rapidly gaining strength. In a house devoted principally to *Muscat* of *Alexandria* they have not broken well; several of the eyes have not started yet, though some of the growths have made considerable progress. In the same house *Black Hamburg* and *Madresfield Court Black Muscat* have started into regular growth. We have now suitable weather for forcing; the nights are not cold, so that it is not necessary to overheat the hot-water pipes, and sometimes we can shut-up early and utilise the sun's rays.

Those having charge of forcing houses at this season should pay much attention to the ventilation. When cold winds are blowing from the north or east, with bright sunshine for half an hour, and the sun is hidden behind a bank of clouds for a similar period, with glimpses of sun and clouds intervening all through the day—when such is the case it is better to let the temperature run up from 5° to 10° than to open the ventilators too much and chill the tender growths. Shut-up very early in the afternoon, any time after two o'clock, or at least before three, according as the house faces the sun. At any rate, no harm will result to the *Vines* if the thermometer rises to 85°. Our time has been taken up tying and training the young growths as described two weeks ago. We keep up a good supply of moisture from evaporating troughs and by sprinkling the paths and borders, but the *Vines* are not syringed after the buds are fairly started. While we approve of a good supply of moisture, there is a probability of overdoing it, especially if the water-troughs are cast on the pipes. This has been abundantly proved in an early house here, where it is found that by using all the water-troughs early in the season, at a time when the first leaves are forming, the foliage produced is thin in texture, and will not stand an hour's sun in March; and when only half the number of troughs is used the growths are stronger, and the leaves robust and healthy.

Made a sowing of Dwarf *Kidney Beans* thickly in a box, to be planted out in pots when they are sufficiently advanced.

*Strawberries* in pots are doing very well this year. The earliest batch has scarcely any plants in it that have not thrown up abundance of flower trusses; the fruit has set well and is swelling-off nicely, though scarcely any attention was given to setting the flowers. The main elements of success are a comparatively dry atmosphere and a night temperature of 60°, with a little rise in the daytime, the ventilators front and back being kept open a little even in dull cold weather. The same treatment suits *Pines* in the house where the fruit is ripening. Weak liquid manure water helps to swell the fruit, and should be applied at each alternate watering. No manure water is applied after the fruit changes colour.

*Peach House*.—Should the occupants of this structure now be in flower, it is very desirable to brush over the anthers with a camel-hair pencil; this will facilitate the setting of the fruit, but it will not obviate the effects of inefficient ventilation or an over-moist atmosphere. The house should be aired very early in the morning: open the top first, and as the day advances a little air should also be admitted by the front ventilators. If there is bright sunshine it will give an opportunity to admit air more freely. See that the border in which the roots are is not overdry; although the management may be right in every other respect, if the roots are in a dry medium the flowers will drop off.

### ORCHARD HOUSE.

The only occupants of this structure now are *Peach* and *Nectarine* trees, with *Strawberry* plants on the shelves near the glass. The trees are all in pots and are looked over once a week; those that are dry get a thorough watering. The *Strawberry*

pots seldom require water more than once a-week at this season, but the soil should not be allowed to become too dry. The house ought to be thoroughly fumigated before the flower buds open to destroy aphids. Ventilate freely in the day time, shutting up close at night.

#### STOVE AND GREENHOUSE.

Orchids throwing-up flower spikes must be carefully watched; they should be examined every night with a lantern if slugs are in the house. *Oncidium ampliatum*, the flower spikes of which are now throwing up, is exceedingly attractive to them. There is no better way of getting rid of them than by looking over the plants, say at 8 and 10 P.M. We have not yet been able to entirely eradicate bug from the house, this pest is now showing signs of active life. Our plants that are known to be infested with it are looked over (with a sponge dipped in water wherein soft soap has been dissolved), once a-week if possible. There is a possibility of getting rid of mealy bug entirely if it is followed-up persistently. Green fly seems to be more than usually abundant this year. The only certain destructive agent in greenhouses or forcing pits is tobacco smoke, but the houses must be fumigated immediately it appears, for if it is allowed to increase the plants are much weakened. Roses, stage and fancy *Polargoniums*, suffer the most from its attacks. The worm which attacks the Rose bud in an early stage of its development must be searched for on Roses being forced. It can readily be detected by observing the leaves on the shoot near the top, they are ingeniously fastened together as a means of protection.

The greenhouse department is now gay with spring-flowering bulbs and plants. As regards nearly all forced subjects, they ought to be removed from the forcing house before the flowers are expanded, as if these are allowed to open in heat, as a rule they will not continue long on the plant when removed to a cool house. See that all specimen hardwooded plants are trained into shape as soon as possible.

#### FLOWER GARDEN.

We ran the lawn-mower over the lawn, and this has greatly improved its appearance. Digging shrubbery and herbaceous borders, sweeping walks, and keeping all as tidy as possible. Continue to propagate all bedding plants of which there is not a sufficient stock.—J. DOUGLAS.

### TRADE CATALOGUES RECEIVED.

S. Dixon & Co., 48a, Moorgate Street, London, E.C.—*Select List of Vegetable Seeds, Flower Seeds, Potatoes, &c.*

Drummond Brothers, 52, George Street, Edinburgh.—*Catalogue of Vegetable and Flower Seeds.—Select List of Hybrid Gladioli, &c.*

Teutschel & Co., Colchester.—*Retail List of Japanese Lilies, Orchids, &c.*

John Harrison, Grange Road, Darlington.—*Descriptive Catalogue of Vegetable and Flower Seeds, Bedding Plants, &c.*

### TO CORRESPONDENTS.

"\* We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to The Editors of the Journal of Horticulture, &c., 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

BOOKS (A Constant Subscriber).—London's edition of "Repton's Landscape Gardening," Appleby's "Orchid Manual." The latter can be had from our office free by post if you enclose 2s. 7½d. postage stamps with your address.

BURNING OIL IN GREENHOUSES (H. T. H.).—Any combustible burnt in a greenhouse is injurious to the plants unless there is a flue or chimney of some kind to convey the fumes from the burning combustible into the open air.

VINE BORDER (J. B.).—You will have seen directions for forming one in our last number, page 106.

CROQUET GROUND (J. A.).—We published full directions for making a bowling green in our No. 468, and the same directions apply to a croquet lawn. It should not be less than a quarter of an acre, and oblong is the best form. 60 yards by 20 yards is a good proportion.

FUCHSIA MALFORMED (J. E.).—It is a curious sport, three small corollas in one calyx; but it would not be permanent, probably, if the branch producing it were rooted; nor, if permanent, do we think it would be so graceful as the flower in its normal form.

STOVE PLANTS (Julia M.).—We hope in a short time to have a series of

communications on the subject. We have at present no manual on their cultivation.

ORCHIDS (F. M. J.).—"The Orchid Manual" includes the culture of greenhouse and hardy Orchids. You can have it free by post if you enclose thirty-two postage stamps.

PLANTING FLOWER BEDS (S. N. M.).—We cannot undertake planting, we can only criticise that which is proposed. If you send another plan with your own arrangement we will suggest any alterations we think desirable.

LITCHI OR LITCHEE (G.).—The usual botanical name applied to the tree bearing this fruit is now *Euphoria Litchi*, but it has been included in other genera, as *Dimocarpus*, *Nephelium*, *Sapindus*, and *Scytalia*. It was introduced here by Mr. Warren Hastings in 1785. The dry fruit met with in our markets gives but a faint idea of what it is when eaten fresh in its native country.

FORMING BUSHY CINERARIAS (F. H.).—Your query was answered last week, page 106. We would add that the plants should not be crowded, but be kept near the glass and not touching each other, turning them round if they are likely to be one-sided.

PLANTS UNDER RED CEDAR (X. Y.).—As you cannot get grass to grow you may raise some plants of *Pyrethrum Tchitchewi*, sowing the seed in pans, and placing them in a greenhouse near the glass; when large enough to handle prick out an inch from each other, and finally plant out about 3 inches apart, having loosened the soil about the tree, and watering until established.

POND CLEANING (Idem).—Some lime mixed with the mud and decaying matter taken from the pond would prevent any injury to the members of your family from the effluvia given off; and whilst the pond was being cleaned you might use a disinfectant, as chloride of lime.

WOOLLYBE (W. H. H.).—Having tried the potato plan—a boiled one wrapped in a little hay and laid on its side—without avail, we can only recommend you to place some damp hay against the foot of the walls of the structure where they are troublesome, and in the morning pour boiling water on the hay and down the walls; the woollybe will be secreted under the hay close to the wall. In this way we have killed them by thousands; and the boiling water, if the soil is firm, does not penetrate deeply and cannot injure the roots much, as it need not be poured on in the quantity to do harm. Moss is quite as good as the hay, or better. We have also poisoned them by mixing lead with finely ground oatmeal, so as to form a crumbling paste, added about a table-spoonful of arsenic to a half pint, and placed it on pieces of slate in their haunts; but great care is necessary in using the poison, and it is not always that the woollybe will take it.

SEEDS FOR NEW ZEALAND (C. W. D.).—The principal London or provincial seedsmen know what seeds are most suitable for the district you name. It would be best for you to trust to them to send out a collection.

CAMELLIA FLOWERS NOT EXPANDING (R. B. Shaw).—The buds do not expand from the plants having more blooms than the roots can supply with nourishment, they not being in a very active state. We should repeat the plant as soon as the flowering is over, but not give a large shift, nor place it in a tub as you propose. Drain well, and keep the neck or collar high in the centre of the pot or tub, and remove what old soil can be taken from amongst the roots by a pointed piece of wood. Use the top inch of a light loamy pasture, chop or tear it up fine, and press firm. If the pot admit of an inch or so of fresh soil all round the ball it is large enough.

PANPUS GRASS CULTURE (W. Russell).—Cut off the dead parts in April or when the young growths are being made, but we prefer to leave them until the young growths are somewhat advanced. Mulch round the plant when it begins to grow with some rich compost or well-rotted manure, and water with liquid manure in dry weather.

MESEMBRYANTHEMUM CORDFOLIUM, ECHEVERIA GLAUCA, AND POINSETTIA SOWING (F. J. T.).—The *Mesembryanthemum* and *Echeveria* seed sown now in a gentle hotbed and grown-on well, by bedding-out time, form nice little plants available for planting-out in June after being well hardened-off. They require to be kept near the glass and to be very carefully watered. *Poinsettia pulcherrima* comes into flower in winter, and is grown for its scarlet bracts. It should be sown in a hotbed, grown in heat through the summer, and kept near the glass, so as to be dwarf. It should have a warm greenhouse or cool stove. Cuttings put in during August make the best plants.

PERENNIAL PHLOX SEED SOWING (H. H.).—Sow the seed in March in a pot or pan well drained, and filled to within a quarter of an inch of the rim with a compost of light fibrous loam two parts and leaf soil one part, with a free admixture of silver sand. Make the surface fine and even, scatter the seeds evenly, and then cover with fine soil lightly. Place in a gentle heat, keeping near the glass, and when the seedlings show the second leaves prick-off in pans or boxes about an inch apart, and return to the hotbed, shading from bright sun for a few days. Harden well off, and plant out-doors in rich light soil about a foot apart, where they are to remain to flower.

AMERICAN BLIGHT (C. Y.).—Dress the Apples with the paraffin undiluted applying it to every part of the stem and branches, and particularly to the swelling, but keep it from the buds. You should likewise lay bare the roots, and the thick parts of these may also be dressed with paraffin, using a brush. Do not pour the paraffin about, but confine it to the stem, branches, and thick roots if you find these infested by the blight. If the roots are attacked, the soil removed should be replaced by fresh. It may be necessary to go over the trees in summer, applying the paraffin by means of a brush to the parts affected, but taking care to keep the oil from the leaves and young wood.

DESTROYING DAISIES ON LAWN (C. A. D.).—If your lawn is of moderate extent we should advise you to employ Watson's lawn sand, which undoubtedly destroys Daisies and other weeds; but the lawn is made to appear brown for a time. It may be had of most of the principal nurserymen and seedsmen, directions for its use being furnished with the article. The old plan of grubbing them up with a knife is a tedious but nevertheless good mode of getting rid of them, and if you do not employ the lawn sand we advise this. It is remarkable how soon they appear again after they have been removed, and we incline to the opinion that on some soils it is waste of time seeking to extirpate them. It is better to cut off their heads with a Daisy-knife every second or third day, for it is only when they flower that they mar the appearance of a lawn.

ERRATA.—Page 102, third line from top, first column, for "stooping" read *sloping*. Page 103, twelfth line from top, first column, for "dies" read *dries*. Page 104, sixth line from top, first column, for "when not wanted" read *where not wanted*.

INSECTS ON CLUB-ROOTED CABBAGES (C. L.).—They are a species of the *Acarus*, or Mite, and feed upon the decayed parts of vegetables. Whether

they occasion decay by wounding the vegetables is doubtful. If you remove all your Cabbageworts, burn them, mix some gas lime with the soil, and avoid growing Cabbageworts on the same plot for twelve months, you will exterminate the Acanth.

**INSECTS (W. T. F. M. J.).**—The little flies which are at the present time "infesting your house so as to become a perfect nuisance" are closely allied to the small common house-fly, and which, from their smashed condition, it is almost impossible to determine specifically. They are quite incapable of stinging. We suppose they have been produced from some mass of decaying or putrefying vegetable matter. Has there been any extra washing of wine or beer barrels in your neighbourhood, as the flies resemble the common *Mosilus collaris*?—I. O. W.

**NAMES OF FRUITS (R. W.).**—It is evidently Golden Reineette. (T. Kennedy and Co.).—We do not recognise the Apple sent. (Caroline).—Your Pear is not Chaumontel, and we are at a loss to say what it is. It has, however, the same bitter flavour which the Chaumontel sometimes has when past its prime of ripeness. Acids mixed with sugar for some time have the effect of converting it to a bitter principle. Charcoal powder has the power of destroying bitter principles; we do not know whether it would check their formation in Pears packed in it. (J. F. Smith).—1, White Calville; 2, Danmelow's Seedling; 3, Norfolk Beeling; 4, Birmingham Pippin; 5, Delaware. (T. F.).—1, Shepherd's Fame; 2, Cornish Gillyflower.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### POULTRY HOUSES AND MANAGEMENT.

Five years ago I worried myself to provide roosting-house, laying-house, and sitting-house without involving myself in too large an outlay. From £17 to £20 was about the figure, but the result was not satisfactory to me; and my sole reason for being dissatisfied was, that my fowls were not thoroughly healthy. I had many that suffered from colds; and as draughts were not in the house, I could not help fancying that I was "coddling" my stock too much. During my second year two or three birds took a fancy to high trees to roost in, and I found they were strong and very healthy, laying well, and in capital condition. At the end of the second year I closed the houses altogether, and this is the third winter of my fowls roosting out in the trees about the orchard which forms their run. They are in excellent health; and out of the whole (forty-eight in number), I have not had one sick or sorry. I have watched them most narrowly, and am quite convinced that they thrive better and lay better than a similar stock did when in a warm house. No one will ever persuade me to use the houses again.

As to food, fowls will do well if they are fed with maize twice a-day and with house scraps at noon. But you must limit your adult birds to a certain quantity; and I find that one penny-worth per head per week, with the house scraps at mid-day, is ample maize to keep them in good laying condition. I give ground oats slaked with water three or four times a-week instead of maize for a change; but I do not exceed the penny per head by alternating the food thus.

I have tried custard made of new milk and eggs for chickens, but now I never give anything beyond ground oats slaked with water, and they are as strong as when I fed them with luxuries. When a hen has hatched I at once remove her from the hedgerow where she has sat to a coop without a bottom, and set it close in front of another larger coop, in which I place four times a-day a good allowance of the slaked ground oats. The large coop has a loose board in its roof, through which the food is put, and is 3 feet deep. The young broods go through the bars in front of it to feed, and the adult birds cannot reach it. The chicks in the smaller coop soon run into the larger one, and become familiarised with the larger broods; and when a week old, if the weather is not wet, I turn hen and chicks out to take their chance, taking care that the supply of slaked ground oats in the coop is diligently attended to. The bars are sufficiently wide to allow all the young fowls of eight weeks old to creep through; and in winter, when extra food, in my opinion, is required to make up for want of sun, the bars are wider, and birds older than two months can creep through.

As regards houses for laying in, I have found that hens infinitely prefer to have their nests in the hedgerows, or under faggots, sprays, &c. I used to keep the eggs of my best fowls for setting in a tray in the dining-room, and with a wretched result as to chickens. Now I never remove them from the nest, but put a pencil mark upon them, and only remove those which are sold to be eaten, and the result is five out of six eggs are fertile. When a hen is broody I remove her in the evening to the nest where the eggs are, cover a wire frame with sacking, so as to make her new nest dark for a couple of days, and the result is five chickens out of the six eggs. In the summer I put nine eggs, in the winter six eggs under my hens.

With respect to buying eggs for breeding, I prefer to buy a pullet, and use her eggs; for only twenty chickens out of 130 bought eggs, over and over again, were a result which disgusted me. I know, too, that I was supplied with fresh eggs, but the shaking in transit adds them.

I never "coddle" birds, young or old; but I own to giving all my young growing stock a good meal of slaked oats separate from the adults, to plump them up, and I then can always pitch

upon a fat young bird when I want them for the table. As to sorts or breeds, I keep, to please my eye, Silver-spangled Hamburgs, and think them most beautiful. I have Brahmas, pure and highly bred. (I gave 30s. for the pullets to begin breeding from). I have a grand Grey Dorking cock running with them; and thus mated, the chickens are the best layers of large eggs and the best table fowls I have ever bred. I have sold them at 8s. a-couple, and had 2d. a-piece for the eggs all the year round. My outlay from October 1st to December 31st for corn was £2 19s., my receipts £5 4s. 4d.—C. C.

### EGGS IN WINTER.

SOME of your correspondents have sent you "experiences" of their bad luck this winter. Ours has been unprecedentedly good; and as we think we have found the best plan for ensuring winter eggs, it may be worth recording.

Eighteen pullets, hatched last March and April, began to lay in December, and have given us in the five weeks past, since December 21st, 374 eggs, with very little help from the older fowls, the week's supply ranging from sixty-two to eighty-five at a time when eggs, even in Embrookshire, were worth 1d. or 2d. They have no artificial food. Barley meal with skim milk or broth in the morning, and whole barley at night; a mid-day feed of scraps—raw mangel, or whatever comes to hand—only when snow is on the ground. A good run of field, thicket, and farmyard; a well-built hen-house, with window at each end, ventilating it during the day, and in winter closed at night. No artificial warmth. We have absolutely no sickness among the fowls from year's end to year's end, and we only lose about five per cent. of our chickens—that is, three or four among eighty. We keep about two dozen fowls. In the course of the spring we shall get rid of all our two-year-old hens except eight, which we keep till they have reared us our stock of chickens. From the eight broods we choose twelve or fifteen of the finest pullets for next winter's laying, thus keeping the stock regularly sifted, half "rising one," half "rising two" years old.

The bulk of our stock is Brahmas, and our two cocks are Brahmas. Besides, we have a few Game and three Silver Hamburgs, whose eggs we never set. Our yard supplies ourselves and our village with sittings of eggs, warranted to produce a large average of strong chickens—ten or twelve out of thirteen.

All our theory comes from your columns and Wright's "Practical Poultry-Keeping;" and our skill merely consists in common care and regular cleaning, and measured and moderate feeding, so that we wonder to hear so many in better climates than ours complain of failure. The most forcible lesson we have learnt in seven years' experience is that "favourite hens" are unprofitable—and worse, for they make poultry-keeping an intolerable, distressing business. We have in former years trained hens to the most familiar tameness; and we advise anyone who cannot help making pets of their hens to give up keeping poultry. The favourites are sure to grow fat and unhealthy—a trouble to themselves and to their masters. "Fair field and no favour" is the only rule.—A. D. C.

### REMOVING FOWLS FROM THE LATE BRISTOL POULTRY SHOW.

FEARING that the letter on the above subject, signed by "A LOVER OF FAIR PLAY," might lead exhibitors who did not attend the Show to imagine that the Committee systematically allowed birds to be taken away whenever wanted, I wish to state the reason why the pen in question was removed on Saturday morning. The pullets had been fighting early in the morning, and when the feeders arrived one was much damaged—in fact, completely scalped, and had to be removed. A gentleman soon after claimed the pen on condition that he might at once take them away and doctor the damaged pullet. The latter being in a bad state, we were glad both for our own sake and the exhibitor's to send it off. This pen, and two others sent home on account of being roumpy, were the only pens that left before ten o'clock on Monday night, and any exhibitor who has ever been at our Show will corroborate me when I say that we are very strict in the observance of this rule. As the owner of the said pen of pullets admits having been to the Show, I think he or she might have inquired of the Secretary or one of the Committee the reason of the birds being removed—in fact, I have good reasons for thinking this was done—rather than try to damage our reputation by inserting such a trifling occurrence in the pages of the Journal. In reference to the latter part of the complaint, purchasers of birds often object to others knowing they have bought certain pens, and we never give the information without their consent.—E. CAMBRIDGE.

**NEW WORK ON PIGEONS.**—Messrs. Cassell, Petter, & Galpin announce a new illustrated work on Pigeons, uniform with "The Illustrated Book of Poultry." The coloured plates are to be

similar, and by the same artist. Of the text it is stated that the subject matter will be supplied by Mr. R. Fulton, the well-known dealer, assisted by various of the "fancy" fraternity, edited and arranged by Mr. Lewis Wright, the author of the "Poultry Book."

## DORKINGS AT THE KENDAL SHOW.

(From a Correspondent.)

I am fond of Dorkings, coloured ones particularly; and in my estimation they are the fowl of all others. This is my excuse for troubling you with the following remarks upon them at the Kendal Show.

Class 7, eleven entries (coloured cock any age), contained some very good birds. The first prize went to a remarkably well-feathered bird, shown in first-rate condition, but not large, and rather light—nothing like the first-prize birds of Mrs. Arkwright and Mr. White of some two or three years ago. The second prize was taken by a bird of a nice colour, smaller than the first, and with rather a twisted comb—in fact, pen 53, highly commended, should have exchanged places with him. Third-prize a very fine bird—about the best in the class, but for one fault—viz., his tail (what remained of it) having a strong inclination to touch the back of his head.

In class 8 (Silver-Gray cock, any age), seven entries, the first prize and cup went to a bird of very good colour and fair size, the second pressing very closely for first honours; third, a nice bird. The rest of the class only moderate.

Class 9 (coloured hens), eleven entries, one of the best in the Show. The first prize went to a beautiful pair of hens, well matched, good in colour and in every way, and they certainly should have had the cup awarded them. The second-prize pen contained two very good hens, a fair match in colour, but quite different in shape and style. The third-prize pen consisted of one very good hen and a middling one, rather light in colour. The unnoticed pen, belonging to the same gentleman, was, perhaps, the best in the class as regards size and shape; but unfortunately both birds had very affectionate backs, which is a bad fault, and must in this instance have thrown them out of the prize list. The highly-commended pen, 69, will in time be heard of. They were a pair of beauties, only a little short of size, which, as they appeared young, they may gain.

Class 10, eight entries. The awards in this class were not at all pleasing, the first-prize pen showing no breeding whatever—scarcely any comb, and nothing to commend them but their good condition. Pen 82, a capital pair of hens, should have been first, No. 75 second, and the third as it was.

In the class for Dorkings, any colour (cockerel and pullet), confined to the county of Westmoreland, were some splendid specimens—notably, the first-prize and cup pen, which were of the fashionable dark colour and immense size, weighing over 20 lbs. They were also awarded the extra three-guinea cup for the best pen in all the local classes. The second-prize pen, belonging to the same lady, were equally good in colour, but the cockerel not quite so large. The third prize went to a pen of excellent Silvers, good in all points, and capable of holding their own in any company. Good sound feet prevailed in all classes.

KING'S LYNN POULTRY SHOW.—This includes Pigeons and Rabbits. Entries close on the 12th. There is one prize confined to Norfolk residents in each poultry class.

## SHOWING VERSUS BREEDING.

I was very much struck with the justice of your correspondent's remarks, in his report of the Dorking Poultry Show, on the evil practice of continuing the exhibition season into January, February, and even March. I quite agree with all he says on this subject, and for my own part have long given up exhibiting during this time, which I consider should be a close season, not only for the sake of the birds, which I fear receive very little consideration at some hands, but also for the sake of their progeny. I have but little hopes that an appeal on this subject will have any good effect, as there are dozens of exhibitors who never bred a prize chicken in their life, who have invested in a prize pen at the Palace or Birmingham, and hawk it about from show to show, thus endeavouring by false pretences to dispose of their own indifferent stock at an enhanced price. Buyers of eggs and birds should not be deceived by so shallow an artifice, but should find out who were the winners at the autumn shows, where nearly all must be exhibiting birds of their own breeding. As an enthusiast and keen lover of the feathered tribe, I have often been grieved beyond measure to see noble birds reduced to utter ruin by this continued overshowing, which is little less than cruelty to animals. "*Me tum primum scervum circumstetit horror.*" Then, for the first time, I almost regretted that I was an exhibitor. I am sure all fanciers who are so from inclination and not from love of gain, will agree with me in saying that

February and March shows would be better stamped out.—VIATOR.

## DORKING POULTRY SHOW.

ALTHOUGH many of the classes were open to all England, we could find few exhibitors residing beyond the immediate neighbourhood of Dorking, and the Show was in effect almost a local one. We believe no positive connection can be traced between the town of Dorking and the fowls that bear its name; but the Committee appear to have adopted them, and out of thirty-two classes, twenty, with a great majority of the prizes, were devoted to this variety. The people of Dorking also appear equally interested in maintaining the purity of this breed of fowls, for on our journey from the railway station to the Public Hall, in which the Exhibition was held, we observed several poultry runs, and we were much gratified with the way in which the respective varieties appeared to be preserved. First we saw some Whites, so good that few fanciers would pass them without desiring a close inspection; further on another lot, from which we thought a selection might be made equal to any in the Show; then some good Cuckoos—or Blues, as our Dorking friends describe them—caught our eye, succeeded by others of a similar description, and in every case the particular variety appeared to be kept carefully select, and we could not find one example of the miscellaneous groups of birds that are seen elsewhere at every turn, and are usually included in the very comprehensive category of "Barn-doors."

But to return to the Show. The coloured *Dorkings* were an admirable lot, and we were particularly pleased with the pens exhibited by Mr. Ellis, and his birds throughout showed that they had come from a stock that has been judiciously selected. Some good birds were also shown by Col. Lane, Mr. Greenhill, Mr. Cheesman, and Mr. Clift. The latter gentleman exhibited two pens that were not an acquisition to the Show. The cock in one pen was so weak on his legs it was painful to see him attempt to stand; the other was swollen, and very diseased in the toe. The White *Dorkings* were inferior to the Coloured in the class for "cock and two hens." The third prize was judiciously withheld. The Blue or Cuckoo classes surprised us; in numbers they greatly exceeded our expectations, and the quality assures us that this variety is not so much neglected as is generally imagined. Pen 171 that took the first prize in the single cock class contained a magnificent specimen—rich in colour, very evenly-marked, a good-shaped rose-comb well set upon the head, no trace of white in the earlobe, and thoroughly sound on the feet; a little white was to be found in the sickles, otherwise we should have called him a perfect bird. A few classes for other varieties followed, but as in the larger number of them only a single prize of £1 was offered for competition, the entries were very limited.

In the *Brahma* class a good pen of Darks, containing a beautiful pair of pullets very evenly marked, were first; the rest, with the exception of a pen of Lights belonging to Mr. Pares, were a poor lot.

The *Spanish* class was a very inferior one, but we liked pens 219 and 225 better than the winners. Classes for *Game*, *Bantams*, *Hamburghs*, *Ducks*, &c., followed, but they were only moderate, and call for no special notice. The total number of entries was 323. We published the prize list last week, together with a report from a correspondent.

## BRIDGNORTH POULTRY SHOW.

THIS was held on the 21st and 22nd ult., and the entries of poultry and Pigeons were very good both in numbers and quality. The following are the awards:—

**BRAHMAS (Light).—Cock.**—1, T. A. Dean. 2, J. Bloodworth. 3, M. Leno. 4, Mrs. H. J. Bailly. *vhc.* Mrs. A. Williamson. *hc.* A. O. Worthington; — *Crabtree*. *c.* W. Tidd; *Rev.* N. G. Ridley. *Hen.*—1, J. R. Rodbard. 2 and 3, Mrs. A. Williamson. 4, H. M. Maynard. 5, J. Mitchell. *hc.* W. Tidd; *W. H. Crabtree*; *J. Bloodworth*; *A. O. Worthington*. *c.* J. R. Rodbard.

**BRAHMAS (Dark).—Cock.**—1, A. Taylor. 2, F. Bennett. 3, R. B. Wood. 4, W. H. Crabtree. *vhc.* A. Bamford. *hc.* J. Walker; *H. Lingwood*; *J. Watts*. *c.* H. B. Morrell; *W. G. Cumming*; *W. Bevan*. *Hen.*—1, T. F. Ansfield. 2, W. H. Crabtree. 3, E. Pritchard. 4, T. F. Ansfield. 5, J. Watts. 6, W. Bevan. *vhc.* T. F. Ansfield; *J. Watts*. *hc.* H. B. Morrell (2); *Rev.* J. D. Peake; *Dr. J. Holmea*; *J. H. Kemp*. *c.* H. Lingwood; — *Whitehous* (2).

**COCHINS (Cinnamon or Buff).—Cock.**—1, T. Stretch. 2, A. Taylor. 3, W. A. Burnell. *vhc.* H. Feast. *hc.* T. A. Dean; *H. Lingwood*; *J. Bloodworth*; *J. K. Fowler*; *S. R. Harris*. *Hen.*—1, A. Taylor. 2, Dr. W. K. Bullmore. 3, W. A. Burnell. 4, J. Wyse. *vhc.* J. Bloodworth; *T. F. Ansfield*; *A. Taylor*. *hc.* W. Shaw; *D. Barry*.

**COCHINS (White).—Cock.**—1 and 3, W. Whitworth, jun. 2, R. W. Beachy. *vhc.* W. A. Burnell. *hc.* R. S. Wooding; *Mrs. A. Williamson*; *C. Bloodworth*; *R. Chase*. *Hen.*—1, R. W. Beachy. 2, Mrs. A. Williamson. 3, W. Whitworth, jun. *hc.* W. Whitworth, jun.; *C. Bloodworth*.

**COCHINS (Partridge).—Cock.**—1 and 2, A. Taylor. 3, T. Stretch. *hc.* H. Tomlinson. *Hen.*—1 and 3, E. Tudman. 2, T. Aspdon. *vhc.* T. Stretch. *hc.* T. Aspdon; *A. Taylor*.

**DORKINGS (Coloured).—Cock.**—1 and 3, A. Darby. 2, H. Lingwood. *Hen.*—1 and 3, A. Darby. 2, H. Lingwood.

**DORKINGS (Any other variety).—Cock.**—1, A. Darby. 2, Conness of Dartmouth. 3 and *hc.* O. E. Cresswell. *Hen.*—1 and 3, L. Wren. 2, A. Darby. 4, O. E. Cresswell.

**GAME (Black-Red).—Cock.**—1, S. Field. 2, H. Horton. 3 and *hc.* A. B. Dyas; *Hen.*—1, W. J. Pope. 2, S. Field. 3, J. Mason. *hc.* P. A. Eeck; *J. Newdigate*; *H. Browne*.

**GAME (Any other variety).—***Cock*.—1, Miss Osborn. 2, A. B. Dyas. 3, T. P. Lyon. *Hen*.—1, Miss Osborn. 2, A. B. Dyas. 3, W. Jones.

**HOUDANS.**—1, W. Dring. 2, G. D. Harrison. 3, W. Whitworth, jun. 4, E. B. Wood. *hc*, W. H. Coppleston; G. W. Hibbert.

**FAPENCH (Any other variety).**—1 and 2, R. B. Wood. 3, W. Dring. *hc*, Rev. N. G. Ridley. *hc*, E. Pritchard; H. Feast.

**HAMBERGHS (Gold or Silver-pencilled).**—1, N. Marlor. 2, H. Beldon. 3, T. Blakeman. 4, T. Dean. *hc*, T. Ward, jun.; Mrs. G. M. Kells; J. Clarke; T. Bolton; 1, Davies; J. Ward. *hc*, H. Feast.

**HAMBERGHS (Gold and Silver-pencilled).**—1, W. Clayton. 2, T. Boulton. 3, H. Beldon. *hc*, P. Hanson; T. Wilde, jun. 4, W. Speakman; E. Claydon.

**HAMBERGHS (Black).**—1, Rev. W. Serjeantson. 2, T. W. Holmes. 3, N. Marlor. *hc*, Rev. W. Serjeantson. — *Kilvert*.

**LEGHORN.**—1, Miss Hill. 2, Plymouth Rocks. —1, Miss Hill. 2, J. Long. 3, R. R. Fowler. *hc*, Miss Hill; R. Fowler.

**MALAYS.**—1, Rev. A. G. Brooke. 2, J. S. Rooth. 3, R. Hawkins. *hc*, A. Glover, jun.; T. Harding.

**POLANDS.**—1, A. Taylor. 2 and 3, H. Beldon. *hc*, A. Darby; D. Mutton. *hc*, T. Dean; C. Bloodworth.

**SILKIES.**—1, R. S. S. Woodgate. 2, O. E. Cresswell. 3, S. P. Broad.

**SPANISH.**—1, J. Leeming. 2, T. Moore. 3, Mrs. E. Allsopp. *hc*, A. Darby. *hc*, E. Jackson; J. Mansell; R. Newitt. *c*, J. A. Bab.

**ANY OTHER DISTINCT VARIETY.**—A. Darby. 2, W. & T. Holt. 3, R. Loft. *hc*, S. B. Perry; T. A. Bond; W. Badger; J. Clark.

**SELLING CLASSES (Brahmas, Cochins, or Dorkings).—***Cock*.—1, J. K. Fowler. 2, W. Beachy. 3, A. F. Sparkes. 4, A. Darby. 5, R. O. Anwyll. 6, Rev. R. W. Everett. 7, J. Benton. 8, T. A. Dean. 9, W. G. Patchett. 10, H. Yardley. 11, H. B. Morrell. *Hens*.—1, J. Watts. 2, R. W. Beachy. 3, W. A. Burnell. 4, W. Badger. 5, J. Benton. *hc*, T. F. Ansell.

**SELLING CLASSES (Any other variety except Bantams).—***Cock*.—1, J. Andrews. 2, J. F. Siltoe. 3, E. Jackson. 4, W. Foster. *hc*, G. Berry. *Hens*.—1, J. Leeming. 2, T. Moore. 3, W. Foster.

**SELLING CLASS (Bantams).—**1, T. Barker. 2, W. F. Entwistle. 3, R. Wingfield. 4, — Ashley.

**GAME BANTAMS (Black Reds).—**1, R. Youll. 2, W. F. Entwistle. 3, W. Wingfield and Andrews. 4, G. Langford.

**GAME BANTAMS (Any other variety).—**1 and 2, W. F. Entwistle. 3, J. Long. *hc*, E. Payne; R. J. Lloyd-Price; W. Wingfield & Andrews; R. Youll.

**BANTAMS.**—1 and 2, M. Leno. 3, W. Robinson. *hc*, R. S. S. Woodgate; Rev. W. Serjeantson. *hc*, Miss M. Whitmore; R. Wingfield; A. Taylor.

**TURKEYS.**—1, M. Kew. 2, Mrs. Parsons. 3, Countess of Dartmouth. *hc*, Mrs. A. Line. *hc*, — Cherrington; F. E. Richardson; Miss Hotehiska; J. Lynde; J. Vase. *c*, Rev. N. G. Ridley; E. Kendrick, jun.; R. Macalister.

**GEES.**—1, R. J. L. Fryer. 2, M. Kew. 3, Mrs. H. J. Bailey.

**DUCKS (Aylesbury).—**1, J. K. Fowler. 2, T. Boulton. 3, Dean & Son.

**DUCKS (Roen).**—1, Rev. J. E. Evans. 2, E. Kendrick, jun. 3, W. Whitehead. *hc*, W. H. Houghton.

**DUCKS (Black).**—1 and *hc*, Rev. W. Serjeantson. 2, G. S. Sainsbury. 3, J. J. Mutton.

**DUCKS (Any other variety).—**1, W. Boucher. 2, Rev. W. Serjeantson. 3, M. Leno. *hc*, M. Leno; H. B. Smith.

**DUCKS (Any variety).—**1, Rev. W. Serjeantson. 2, R. Macalister. 3, A. Haslam.

**LOCAL CLASS (Any variety).—**1, — Baker. 2, Mrs. J. S. Ireland. 3, C. Devereux. 4 and 6, T. Tones. 5, W. Warner. *hc*, J. Roberts.

**PIGEONS.—SINGLE BIRDS.**

**ANTWERPS.**—1, W. Slater. 2, T. Bristow. 3, T. Edwards, jun. 4, — Gamon.

**CARRIERS.—***Cock*.—1 and Cup, H. Yardley. 2, P. R. Spencer. 3, J. E. Spence. *hc*, J. E. Spence; J. F. Hinks. *Hen*.—1 and 2, P. R. Spencer. 3, W. P. Keall.

**POUTERS.**—1, P. R. Spencer.

**BARDS.**—1 and Cup, H. Yardley. 2, W. Townson. 3, G. W. Dutton. *hc*, L. Roach. *c*, P. R. Spencer.

**DRAGONS.**—1 and 2, W. Smith. 2, W. Gamon. *hc*, W. Gamon; Mrs. S. Cliff; J. Kendrick; S. Salter; H. Yardley.

**FANTAILS.**—1 and *hc*, Rev. W. Serjeantson. 2, H. Yardley. 3, Q. T. Bluhm. 3, J. E. Spence.

**JACOUBS.**—1, O. E. Cresswell. 2, P. Hickman. 3, Rev. A. G. Brooke.

**MAGPIES.**—1, C. G. Hitchcock. 2, J. Watts. 3, M. Ord. *hc*, C. G. Hitchcock; T. Hinks.

**NUSS.**—1 and 2, W. Croft. 3, Rev. A. G. Brooke. *hc*, W. Croft; Rev. A. G. Brooke.

**OWLS.**—1, Cup, and *c* T. W. Townson. 2, Van Souden. 3, W. Tedd. *hc*, A. Darby; A. J. Barnes; Van Souden.

**TURBETS.**—1 and 3, W. Croft. 2, S. Salter. 4, 5, and 6, O. E. Cresswell. 7, P. A. Fiddell.

**TEMPETERS.**—1, J. Lederer. 2, — Pearce. 3, P. R. Spencer.

**TEMPERS.**—1, Cup, and 2, H. Yardley. 3, J. Fielding, jun. *hc*, J. Kendrick; J. Pearce.

**ANY OTHER VARIETY.**—1, M. Ord. 2 and 3, H. Yardley. *hc*, W. Tedd; M. Ord.

**PAIRS.**

**ANY VARIETY.**—1, J. Peace. 2, J. Watts. 3, P. R. Spencer. 4, A. Darby. 5, H. B. Wolryche.

**JUDGES.**—*Poultry*: Mr. R. Teebay and Mr. J. Douglas. *Pigeons*: Mr. Esquilant.

## WOLVERHAMPTON POULTRY SHOW.

This was held on January 30th and 31st, and the 2nd inst. in Agricultural Hall. The following are the awards:—

**DORKINGS.**—*Coloured, except Silver Grey*.—1 and Extra, J. Walker, Rochdale. 2, L. Patton, Hillmore, Taunton. 3, J. Copley, Prescot. *Silver Grey, and any other variety except Coloured*.—1, J. K. Fowler, Aylesbury. 2, W. K. Rutledge, Kendal. 3, J. Robinson, Garstang.

**COCHINS.**—*Cinnamon and Buff*.—1, Extra, and 2, W. A. Taylor, Manchester. 3, W. H. Crabtree, Levenshulme. *hc*, H. Lacy, Heblen, Eri; W. H. Crabtree. *Cock*.—1, W. A. Taylor, Southwell, Notts. 2, W. A. Taylor. 3, H. Tompison, Gravelly Hill, Birmingham. *Hen*.—1 and 2, W. A. Taylor. 3, H. Goodfellow, Madeley. *hc*, C. Bloodworth, Cheltenham; T. Groves, Salford. *c*, J. Watts, King's Heath, Birmingham.

**COCHINS.**—*Brown and Partridge-feathered*.—1 and 2, T. Stretch, Ormskirk. 3, W. A. Taylor. *Cock*.—1 and 2, E. Tindman, Whitechurch, Salop. 3, W. A. Taylor. *hc*, Hon. Mrs. Suggen, Wells; E. Tindman. *Pullet*.—1, W. A. Taylor. 2, Hon. Mrs. Suggen. 3, W. H. Crabtree. *hc*, Rev. R. Story, Leighton Vicarage; J. L. B. Wetherhampton; E. Tindman.

## FAKENHAM POULTRY SHOW.

The fourth annual Exhibition of the Fakenham and West Norfolk Poultry Club was held on the 3rd and 4th instant, in the well-lighted and ventilated Corn Hall, and attracted the attention of the public beyond the expectation of the most confident, the weather not being all that could be desired. The arrangements were good and well carried out by an ener-

wings with very pale blue;" and as this last description would afford some apology for her being in a Blue class, it is, in my opinion, probably correct.

It is singular that none of us quite agree; but in all three descriptions the very pale ground-colour, combined with dun, are found. Returning to "TURKEY QUILL's" first letter, he remarks that blue-black means simply a bad black, buff-yellow a bad yellow, &c., &c. To this I cannot agree. A blue-black means that the black is "bad," certainly; but it means that the black is bad in the direction of being blue; and there is another equally "bad black," which would not be so described. So of the buff-yellow, &c.; they do not mean simply "bad" colours, but bad in certain definite directions. In exactly the same sense I certainly meant that the Carrier hen was "a bad-coloured dun," but bad in the direction of being silver. The only alternatives I can conceive would be a dun silver (which would be a barbarism) or a dun chequer; and the dun was not dark enough nor the chequer clear enough for the latter term.

I may, however, add that my very obvious intention was not to give such a precise description of the bird as might convey to distant fanciers the colour of every feather, but to express the impropriety of her being in a Blue class. For this purpose I used the nearest short expression which came to hand. I shall be glad to know what "TURKEY QUILL" would have called her; but beyond that, the question as to this particular bird is not worth discussion. If it should, however, be the means of opening-up the general nomenclature of colours, such a discussion may prove both useful and interesting; but I would suggest to "TURKEY QUILL" to simply mention any point that occurs to him frankly and directly on general grounds. It will equally answer his purpose, and save both time and space.—YOUR REPORTER AT GLASGOW.

I HAVE noticed "TURKEY QUILL's" notes on the above subject. The Carrier in pen 77 at the late Glasgow Show was what I would call a Dun-chequer, the ground colour of the feathers being of a light dun, and tipped with a darker shade, presenting a dappled appearance like a Blue-chequer. The term silver dun as applied to Antwerps of a mealy colour is, as he says, incorrect; but Antwerps are to be had of a colour which the term silver dun is, I think, a correct name for—viz., a silvery ground with dun bars and neck. The real silver colour as seen in Baldpates, Dragons, and occasionally though rarely in Pouters, is a very light blue with black bars. Silver Dragons with dun bars are Silver Duns, and black-barred birds are Silvers. There are five colours of barred Pigeons: blue with black bars, silver with black bars, silver-dun with dun bars, mealy with red bars, and yellow-mealy with yellow bars. When I came across pen 77 at Glasgow Show, and referred to the catalogue, I was of opinion that the bird being a Dun-chequer had no place in the Show at all, and was not entitled to the prize. The three classes for young Carriers were:—No. 11, Blacks; 12, Duns; and 13, Blues. In the old classes, however, the Blues included any other colour, and it was an evident omission not to have the same clause in the young class.

I think the following list includes all the self-colours found in English Pigeons:—Black, red, yellow, dun, blue, silver-dun, mealy-yellow, mealy-blue, chequer, red-chequer, yellow-chequer, dun-chequer. Besides these there is a colour often seen in India, particularly in Fantails, Sherjees, and Mookies, which I would call simply blue, being of the colour of the body of a Blue Pouter, but without black bars or dark neck and tail. White might be called a self-colour also, except that, properly speaking, it is not a colour, being the result of want of colouring matter in the feathers. Pure white Pigeons (albinos) are to be got in almost every large field dovecot, and the ingenuity of man in matching whites with coloured birds has resulted in mottles, baldpates, splashes, and every degree of marking. I would not call an Archangel a self-coloured Pigeon, though without white, because it is of two very distinct colours—black and copper-coloured.—J. C. LYELL.

## BELFAST CANARY SHOW.

(Concluded from page 113.)

BELFAST SHOW was a first attempt; and the launching of such an expensive affair is a matter which keeps its promoters on thorns till the opening of its doors decides whether the public or the Society are to pay for the spectacle. It requires a knowledge of the tastes and inclinations of townspeople before entering on the speculative business of exhibitionising, and the process of educating people in a certain direction may turn out rather expensive. The schedule was good and the scale of prizes liberal, and I am sure it only requires that exhibitors be made aware of the facilities for carriage to ensure for the Belfast Society a brilliant future. The success of this, the first Show, must have been very gratifying, but I am much mistaken if the Committee will rest satisfied with less than twice the number of entries next year. With such stuff at the back, a show is capable of being increased to any extent and then the question

will be, as was gravely mooted, "Where shall we put them?" "Build a place," replied Mr. Montgomery.

I am not in the poultry "line," though I have a lot in my yard which I will show against all comers as eaters. I refrain from publishing my balance-sheet lest it should deter others from commencing such a healthy pursuit. "WILTSHIRE RECTOR" once tried to get me into Pigeons; and if any birds could have appealed to refined taste, the pair of snowy Fantails he sent me ought to have done so. And once Mr. Fulton took me round the Newcastle Show, and talked to me like a father. I suppose my tastes lie in another direction. But "what great events from trifling causes spring!" My falling in love with the Canary arose simply from the fact of a drunken sailor sitting on a cage on my door-step. To save the birds I took possession of the cage. The man never called for them, nor could I ever find the owner. And when I moved into the house where I at present reside, I found in the yard a small poultry-house. It looked to me like a Bantam arrangement, and I have since discovered that birds of no less note than Mr. George Hall's Bantams have lived in it—and possibly may again. That little poultry-house set me going, and how soon a taste grows! It was with a new pleasure I went the round of every pen in the Show with Mr. Leno. The use of the Judges' book left the counterfoils in our hands, and his notes and remarks upon nearly every pen were extremely interesting, indicating the accomplished judge, and showing with what care he had weighed over the merits and demerits of every bird. The poultry world has received a valuable acquisition in the elevation of Mr. Leno to the "bench," and no inquirer (or grumbler either) could look in his face and say, Why? without feeling certain of getting a most courteous explanation or satisfactory reply, at the bottom of which plainly lies undeviating honesty of purpose. In the Selling class several pens were pointed out to me as representing full value for money; and notably in the single cocks one of Mr. John Stuart's Dark Brahmas, No. 158; and among the "best pair of hens or pullets" Mr. R. P. Williams' Dorkings, No. 200; and Mrs. Taaffe's Cochins, No. 225.

The Ulster coat was happy among the Pigeons, and duly performed his devotions before Mr. James Montgomery's wonderful Dun Carrier cock. I didn't watch him; but I understand that when he put the cup-card on the pen he respectfully raised his hat to the noble bird.

The great features in the Canary classes were the "Scotch Fancies"—indeed, no other variety except the Belgian seems to have been cultivated in Belfast. The Belgians themselves were only an indifferent sample, though there were one or two which showed they had it in them. The Fancies were a fine lot of birds, but in many cases very coarse in feather. The silver cup for the best specimen was won by Mr. Samuel Croll with a Yellow hen—a gem, her mother standing second. I was glad to find both belonged to the same owner, as they were so much superior to the rest, and so much alike that it was no easy matter to separate them. I think I have seen longer birds, but for symmetry and quality of feather they were unique. The winning birds were all meritorious specimens, and but very few in either of the four classes were thought undeserving of commendation. Mr. Baxter's small collection from Newcastle, embracing Clear, Variegated and Crested Norwich, Lizards, Coppy, Cinnamons, Variegated ditto, and Mules, including a very pretty Cinnamon Mule, bred from Cinnamon cock and Goldfinch hen, attracted considerable attention, and next year these varieties will find a place in the schedule. Our British birds were poorly represented. The Skylark, Song Thrush, Blackbird, Bullfinch, Starling, and other familiar faces were absent. But Belfast did its best; and if fanciers will do their best to help Belfast, then Belfast will do its utmost to help them.

Judging over, we endeavoured to solve the problem as to how many persons an Irish "kyar" will carry, and how many miles an hour a grey horse can "reel off." Both seemed to me to be unknown quantities. Our destination was Springfield, where Mr. Mulligan has a pretty little place, and thence to Whitecock, the residence of Mr. Firth, the working Secretary, pleasantly situated at the base of one of the mountains which bound Belfast on the north-west. I should think the "jarvie" never drove such a load before. About half-way to Springfield he pointed over his left shoulder with his whip to a large red-brick building. "Dye see that?" "What?" "That." "Which?" "That." "Well!" "Shure an' it's the Lunatic Asylum!" We dropped Mr. Jones at Springfield, and picked him up on our return. He was doing the *otium cum dignitate* in an easy-chair with an Havannah. A glass of champagne and a look at Mr. Mulligan's poultry cups, and the "jarvie" whisked us back to Belfast to the serious business of the day—the dinner at the "Imperial." After-dinner speeches are proverbial; but Mr. Montgomery's loyal speech on giving "the Queen," his remarks on Home Rule, and his hints and advice to young fanciers, the fruits of years of experience, will not be forgotten by those who listened to them.

An early ride and a bracing air enabled us to do justice to Mr. Firth's good things at breakfast at Whitecock next morning, and as the steamer did not sail till five, there was not that cause

for apprehension as in the case of the hot fish. Everything must come to an end, however, and five o'clock that evening saw us steaming out of Lough Larne on our homeward journey. Three hours' passage, and not in any light this time. But it was a lovely evening, and one could hardly imagine it was January. The lights at Larne and away to the north on "The Maidens" grew gradually less till they disappeared altogether, while the revolving light on Corsewall Point flashed its alternate red and white glare with greater brilliancy as we neared Loch Ryan. Cairnryan was sleeping quietly under the hills, the light from its friendly beacon streaming into the Loch as we steamed up its quiet waters, not sorry to be nearing home, with pleasing recollections of kind friends on the other side.—W. A. BLAKSTON.

### THE BEE-KEEPER'S CALENDAR FOR FEBRUARY.

This month, like last, is one of inactivity amongst bees. As the days lengthen the hopes and enthusiasm of bee-keepers are awakened, and some preparations are made for coming events. After so many unfavourable seasons in almost unbroken succession, let us anticipate that 1874 will be a favourable one for the apirians of Great Britain. For two or three years I have been anxious to realise £100 profit in one season from bee-keeping, partly from selfishness, partly because my father once saved that amount in one year from his bees, and chiefly from my desire to have an encouraging example of bee-keeping to place before the working rural population of England.

If the weather continue mild, queen bees will begin to lay early in this month. In this neighbourhood I once saw young bees on the wing on the 15th of February. The queens that year commenced to lay in January. About three years ago we had a very cold late spring, when queens did not lay till about the end of March—at any rate, the first hatch of brood did not appear till the middle of April. An open early spring and a warm early locality are very advantageous to bees, for their lives are of short duration—nine months at most, but very few of them live so long. If a hatch of brood be not obtained in March to fill up the ranks thinned by death, many hives become so weak in bees that these have a hard struggle to live, and the population of some is altogether destroyed. In a cold spring and cold late locality I think it is desirable to stimulate bees by artificial feeding, and thus cause them to breed earlier than they would otherwise do.

It should be borne in mind that spring feeding is simply to stimulate and keep alive, and the food not to be stored-up as in autumn. During February half a pound of sugar with half a pound of water weekly will be enough for a hive of moderate strength. And this half-pound should be given in three doses—say one every Monday, Wednesday, and Friday. Every bee-master has his own mode of administering food to his bees. For spring feeding we use troughs about 1 foot in length, 2 inches broad, and less than half an inch deep. These are filled or half filled and pushed into the hives by the doors, thus twenty hives may be fed in less than ten minutes' time. If bees have been prevented from leaving their hives by frosty weather for weeks, an accumulation of dirt will be found on their boards, and it should be scraped off this month.

Cottagers who make their own hives should get them ready during the long evenings of winter; and amateurs, too, should prepare beforehand for an increase of swarms. We have already ordered fifty large hives for our swarms. These, with twenty old ones now empty, will probably be required for swarms in May and June. I calculate on having at the rate of three swarms from two stocks—that is to say, one swarm from each hive, and a second swarm from every second hive of bees. The readers of this Journal know that Pettigrew has for years been ringing the bell and telling the bee-keepers of Great Britain and Ireland to adopt hives larger than those in general use if they wish to realise great profits or large results from bee-keeping. It is evident that a large number of workmen will compass and do more work of every kind than a smaller number, and it is equally clear that the births in a large town will far outnumber the births in a country village.

In preparing hives for the reception of swarms, guide-combs and cross sticks only are necessary. The guide-combs should be sealed to labels of wood, and then pinned on the crowns of hives (of course on the inside), by nails. The combs should be made to run from front to back, and the cross sticks from side to side. Thus the combs cross the sticks and are fastened securely to them. These cross sticks are of much service to bee-keepers who carry their bees from place to place; and they are of use to the bees, for these go from comb to comb across the hives by their means. Where the combs are fastened to the sticks, the bees leave small holes as doors or passages for their own convenience. We put four or five cross-sticks nearly as strong as a walking-stick in every hive. When the combs are cemented to these, the hive will bear a great amount of ill-usage before the combs are injured. We have sent hives to almost every corner of England without injury. If the reader has no guide-comb preserved from last autumn, he should cut out of one of his hives

of bees all he will require for his swarms this year. Old tough comb is better than new brittle comb for this purpose, but it should be cut out before brood be put into it. A bit of comb about 2 inches square is enough for each hive. It is requested that the reader will bear these simple things in mind, for it is not my intention to repeat them at the busy swarming season.

Sometimes a bee-master may wish to remove his bees from one part of his garden to another. The present month is, perhaps, the best time to remove hives a short distance, for bees come out but seldom now; and when they come out it is for a winter dance and purposes of cleanliness, and when on these errands they look well about them, and never go far from home. In times of honey-gathering they leave their hives to go straight to the fields or orchards, and may not discover that the position of their homes has been altered till they return to the old stands. In summer, hives should be removed from one part of a garden to another by short stages—say 1 or 2 yards every day. At present they may, I think, be removed from one side of a garden to another with safety. When this is done, all the hives should go at once; for naturally some bees would return to the old place, and if they found a hive near it, they would seek a home there instead of returning to their new position.

February is a favourable time to purchase hives and commence bee-keeping. Bees can now be removed to great distances without risk of suffocation even in the hands of inexperienced persons. I am frequently consulted as to where bees can be bought, also when bee-keeping should be commenced, and generally recommend those seeking advice to commence with not less than two hives, and to buy, if they can, of the cottagers in their own neighbourhood. When I say neighbourhood I mean within a few miles, for there would be some risk if the bees bought had been standing within a mile of the buyer's garden. When hives of bees cannot be obtained near home, they may always be had of respectable extensive bee-keepers elsewhere. Here let me notice that there exists in the minds of many people, both rich and poor, a foolish prejudice and a ridiculous superstition respecting buying and selling bees. "It is very unlucky to either buy or sell a hive of bees. I bought a hive once, and it died." And the poor man says, "If I sell one of mine all the rest will die." Many old women in England believe that all the bees in their possession will die if they are not told of the death of one of the family of the owner. Such superstition is very remarkable and lamentable. I can believe that many gentlemen have made a commencement in bee-keeping and failed. Their hives may have been diseased and worthless when they obtained them. The season after they purchased them may have been unfavourable, and the bees may not have received proper attention. I venture to express an opinion that almost all the disasters attending hives purchased by beginners have been owing to their own ignorance. It is a most difficult undertaking to teach a novice in bee-keeping how to distinguish between a good and a bad hive, and how to value aright hives at all seasons.

Next month I shall begin to examine hives internally, and continue to examine them thus till the end of September.—A. PETTIGREW, *Sal.*

### HOW TO KEEP BEES AT A PROFIT.

SOME years ago I began to keep bees, from a desire more to learn their habits and amuse myself than for any return I might obtain for the trouble. I have certainly learnt a lesson, but have gained no money. I have now ceased to take much interest in my little pets. On reflection I begin to think my old grandmother right, who kept bees on a common-sense plan. Her rule was to destroy all old stocks, keeping over only the early swarms; so that by having none more than one year old with the "casts," as the later swarms were called, she had two classes of honey—one she sold at a good price, the other was made into a drink called mead. My grandmother seldom fed her bees, for she never attempted to keep a weak swarm over the winter. I begin to think the old woman, by instinct, did what was no doubt the best to get honey. She never had any old foul comb for bees to breed in, as in hives two or three years old, and in not feeding the bees with syrup the comb is not filled with such stuff in the breeding season.

There is another point I think of importance which I should be glad of some information upon. My opinion is that feeding bees, as a rule, is bad; except on absolute danger of their dying, I do not think they ought to be fed. It must be wrong to teach bees to rely on the bottle, as it might tend to make them idle. We have some proof of this; for it is well known that in the tropics where the bees can get honey all the year round they store but little, but in the cold regions of the north, with a very short season, they collect the most honey.

I took some pains to inquire into this subject when in Switzerland. I could not believe that so large a quantity of honey, which I saw in the market, could have been gathered in those narrow valleys so long locked-up in frost and snow; but one season when I happened to be there at the end of May, I could see

the reason then very well. Were it not that I fear you will not publish these remarks I might extend them.—J. C., Brentford.

### SUPERS FILLED ARTIFICIALLY.

I HAVE read with great pleasure the indignant protest by your able correspondent, "A KENFRESHIRE BEE-KEEPER," against the nefarious practice which has within the last few years been adopted, of filling supers intended for sale or exhibition by the artificial means which have been described.

It is much to be regretted that any bee-keeper should have his moral powers so defective as to be unable to see that he lays himself open to a charge of fraud when he palms upon the public, as the product of a single season, an article which in reality combines the collections of two or more. Even supposing such a compound to be genuine honey, it can only be honey of inferior quality and flavour, much of the excellence of that which went to make it up having been lost through age and other influences. If in completing the contents of either large hives or supers sugar has been used, is not the party using it guilty of a crime which is now frequently punished—viz., the crime of adulteration?

I am glad Mr. Breen has made a clean breast of his doings by voluntarily disclosing his proceedings; but I hope we have heard the last of them, and that competing supers entered for prizes will have the affidavit attached to them, declaring that nothing went to their composition but what the bees collected directly from the fields during the period extending from April 1st till November 1st of the year for which a reward is offered.

It is an easy matter to make beautiful large artificial glass supers. There is no need to try. It was accomplished years ago with the greatest success; and I have now to learn that anything has yet been produced superior to the 87 lbs. glass which was so admirably photographed and described by "KENFRESHIRE BEE-KEEPER" in your number of June 4th, 1866. I saw that glass at Moffat Show in September, 1867. I overheard some particulars in regard to its manufacture; but the information obtained was so repelling as to take away all beauties from the super in my eyes.—R. S.

### OUR LETTER BOX.

**YARD FOR DORKINGS (Tauri Caput).**—You have described the paradise of Dorkings. No other breed will suit you half so well, or pay you so much money. Laying is the result of proper management, and keeping early pullers of each year to be layers in the winter. Profitable eggs are those that are laid when other people have none. Houdans are very good layers, but they do not sit. Where there is such a run as you describe, nothing is so profitable as the Dorking. They are good layers, good sitters and mothers. Climate does not interfere. We have seen as good Dorkings bred in Scotland as we ever saw in the south and south-west of England. We know no place where there is not a sale for good fowls, and the Dorking will make you better market fowls than any other. The Spanish do not sit, neither do the Creve-Cœur nor the Hamburgs. At this season of the year the proper plan is to buy a few of the breed you intend to keep, and eggs that you can put under your mongrels as they become broody.

**FERTILE EGGS (T. H. E.).**—Answer to question No. 1.—After two or three days. 2. You may set the eggs after three days certainly. We should have little faith in the cock you mention as a stock bird. In a horse such a disease would be called straining. We know no name for it in fowls. There is no reason why it should be hereditary, but as it is a serious thing to lose the early season, we never advise anyone knowingly to use a doubtful bird or one subject to any disease or infirmity.

**BRAHMA PULLETS (D. Judd).**—As a rule your pullets should be laying, and judging from your description we should say they are laying. You do not tell us the flooring of their roosting house. Whatever may be the difficulties of their out-door run, the flooring of their house may be of earth. They will scratch in this in the morning, and they will resort to it during the day. April pullets have laid before this. Are you sure they do not eat their eggs? It is a nasty trick, and they learn it one of the other. Can they always go out? If not, at what time are they let out? Many bad tricks are learned when they are shut-up together and have nothing to do. "Idleness is the mother of all vices." Change your food a little. Give the barley in the shape of meal instead of whole. Let them have it slaked with water morning and evening, at midday house and table scraps if there are any, if not, give them some whole Indian corn. Discontinue potatoes and Indian meal. Potatoes rather hinder than increase laying. They cause disease of the liver. Do not give them too many worms. In a state of nature they have them only as luxuries. So far as you can do it, let them be exactly as they would be in a state of nature. No disinfectant is needed if the dung is raked off daily, and the gravel forked occasionally.

**DARK BRAHMA'S FEATHERS (Glerum).**—We are not sure you are not mistaking windmills for gulls. We do not understand "streaky" defects in Brahmans. They are not like Hamburgs, where a faint mottling disqualifies. The faint of the feathers you send is, they are tinged with yellow. That is a fault and a grave one. If you choose a cock positively without a buff or chestnut feather on the wing or back, you may breed from your pullets. If they are well marked and pencilled to the throat, you may put the virtue against the vice.

**CROSSING BLACK AND YELLOW JACOBINS (A. B.).**—We have frequently experimented in crossing Black and Yellow Pheasants, and always with a bad result. The young have come strawberry-coloured or smoky.

**POINTS IN CARRIERS (Taylour).**—The tail-wing are the chief—Wattle.—Broad across the base of the head, tilting and tapering from the head towards the point of the bill. It should not press on the cere of the eye, as with age it brings coarseness. The wattle and cere should be of distinct formation. The Eye.—Iris bright orange red; cere, or eye wattle, a complete circle round

the eye, broad, and equal in width. Head.—Long, narrow, flat at the top; the narrower the space occupied by feathers along the top of the head between the eyes the better. In a very superior specimen it will be less than half an inch wide. Beak.—Long, straight, thick, fitting closely throughout its length when closed; it is then called "a box bill." If the upper mandible arches, the fanning becomes even more and more developed as age increases; so much, that not infrequently the upper bill curves over, and the Pigeon becomes what is generally known as "Barrot-beaked." This defect is by many fanciers thought to be brought on by the birds being fed in troughs, by which no free action of the bill in picking up its food is called forth. Mr. Ord, however, doubts this, and believes it to be hereditary. Form.—Neck long, thin, and very slightly curved. Shoulders wide. Wings strong, and puny long. Back rather hollow. Legs large and stout. Attitude erect and graceful. Colour.—If black, the feathers should be jet colour, as a slaty tinge is a great fault; and in Duns, a clear colour is most important, as the feathers should not be at all freckled with lighter colours at the edges, or chequered in the least. Mr. Ord believes that the freckling in Duns is caused by exposure to the sun and weather. His prize birds are kept constantly in the locker, and have not a pale feather; but others, which are allowed to fly about out of doors, are chequered with pale feathers. Your room will do well for Carriers. In such rooms they are constantly bred.

**FEEDING BEES (J. N. T.).**—Owing to the mildness of the weather during the winter months bees have consumed a great deal of their stores. You will, do well to commence feeding at once, and continue to do so till fruit blossoms appear. Bees will now begin to breed, and require more food.

**NEIGHBOUR'S HIVE (T. L.).**—Messrs. Neighbour & Sons, 127, High Holborn, London, W.C.

### REMARKS.

28th.—A dull, damp, grey day, with a little rain.  
29th.—Not by any means a bright day, but placid and free from either wind or rain.  
30th.—Bright and beautiful throughout the whole day.  
31st.—White frost in early morning; warm and bright in the middle of the day, but rather cloudy afterwards.  
Feb. 1st.—Rather a plea all day, though somewhat dull, neither sunshine nor shower all day.  
2nd.—Very dull day, at times very dark, though not at all foggy.  
3rd.—Dark morning; drops of rain commenced about noon and continued (at times) all the remainder of the day, but only slightly, so that it did not altogether reach a measurable quantity; fine in the evening and night.

Temperature nearly the same as last week, except that there was a greater difference between the dry and wet bulb from the air being drier. One or two of the days were quite spring-like.—G. J. SIMONS.

### COVENT GARDEN MARKET.—FEBRUARY 4.

A FEW straggling orders are on the market, but not anything like what there usually is at this season of the year, owing, no doubt, to the influence of the elections. A fair supply is current, both of home-grown and foreign produce, without alteration in prices.

From observations taken near London during forty-three years, the average day temperature of the week is 45.6°; and its night temperature 30.5°. The greatest heat was 67°, on the 16th, 1867; and the lowest cold zero on the 13th, 1855. The greatest fall of rain was 0.59 inch.

## LEAF MOULD, COMPOSTS. AND WATER.

**S**OME time ago the utility of leaf mould as an agent in plant-culture was called in question in a manner that at one time would have sounded very much like heresy; for of the mixtures recommended by writers on plant-culture ten years ago or more, there is scarcely one in which leaf mould is not a constituent part. Writers of even a later date are equally favourable to its use; while quite recently, in an article by that eminent horticulturist, Mr. Pearson. it is mentioned that in Belgium Camellias are grown entirely in leaf mould, a fact which is confirmed by Mr. Wright. There are others, however, whose opinion on leaf mould is as widely at variance from the practice of our continental brethren as it is possible to be—in fact, it will be remembered that in the short discussion which followed the introduction of this subject, one or two writers made a fierce attack on leaf mould, not only doubting its utility, but considering it actually pernicious, and I have on more than one occasion heard it described as little better than poison to some crops. These are hard words, harder than ought to be used; and the writer who stigmatised it as poison was, perhaps, overburdened with leaf mould, had to substitute it for dung to most, if not all, of his kitchen-garden crops, and his soil being light, the result was not satisfactory. Let us, by way of contrast, turn to the case of the nurseryman or suburban gardener with a great extent of glass structures all filled with potted plants, and we shall find that he envies the country gardener the heaps of leaf mould which a well-wooded domain furnishes.

Instead, then, of dismissing leaf mould summarily, let us take a calm and fair survey of its merits or otherwise as an agent in supporting vegetable life, and in doing this it is only necessary to look to Nature for examples, and we shall see that in a great degree like produces like, or, in other words, the decayed foliage of a tree supports the growth of that tree, falling and decaying, as it does, underneath it. In a similar way other vegetation does the same when there are no disturbing causes, which certainly often come into action in the case of herbaceous and low-growing plants. It is not difficult to meet with fine old trees occupying sites innocent of cultivation, where the tree has been supported by those natural means of which the decay of some of its parts form an important item. Here, then, we have leaf mould in its truest sense acting a useful and important part. Or suppose we take a glance at what emigrants are doing in the back woods of America; we shall there see that a primitive mode of cultivation results in very good crops. Trees of all heights and sizes are cut-off at about 2 feet from the ground, and the tops having been burnt, a little scratching of the decayed leafy matter covering the ground forms a sufficient bed for the seed, and a good crop follows. In this case again we have leaf mould in its pure and unadulterated form serving all the purposes of

a staple soil and manure, for a crop, too, from which the material had not been produced. I will take another example nearer home—our woods of many years' growth, and we shall find that the annual growth there met with is in a great measure supported by the decaying vegetation of former years by which the ground is covered. I will now direct attention to the way in which leaf mould assists vegetation, more especially that of the choicer fruit trees and ornamental plants.

To those who recommend the preparation of vegetable compounds, with instructions so minute, and the fractional parts as carefully laid down as if they were of the choicer metals, I have but little to say. Neither do I find fault with those who insist on the leaf mould being the produce of one particular class of trees, for such niceties are rarely practicable; but I may, nevertheless, say that where it is possible to make a distinction in the leaves when collected in the autumn, their utility for heating purposes is of more importance generally than the material they produce when decayed: so that for the former purpose the leaves of the Beech, Oak, Sweet Chestnut, Tulip Tree, &c., which do not decay fast, are unquestionably the best; while those of the Lime, Poplar, Elm, Sycamore, and Horse Chestnut, more quickly decay, and consequently are not so well fitted to maintain a steady heat. I am not sure that as regards their value on the potting-bench they stand in the same order, and indeed it would be difficult to determine the matter from our imperfect data. Oak leaves are held in high estimation as compared to those of other trees, but for heating purposes I give the preference to the Beech. We have as many opportunities of collecting leaves as occur at most places, for every autumn there is an extent of twenty acres to rake over, and the ground is moderately thickly planted with deciduous trees of large size, while there is at least an equal area more thinly wooded, so that the accumulation of leaves by the middle of December is a formidable affair. We have no lack of leaf mould at any time, but beyond saving the Beech, Oak, and Chestnut leaves for the sake of the heat which they afford, I have not paid much attention to the comparative values of the decayed matter which is left after their fermentation. In general soft leaves decompose the most rapidly, and if we reckon their value on the same principle that is adopted with turf we would not place them so high in the scale as the more durable leaves: but it is so difficult to arrive at a just conclusion in this that I am unwilling to give an opinion. I may, however, remark that a long exposure to atmospheric air would seem necessary after decomposition had done its work; for I am far from certain that the confinement to which leaves are often subjected is beneficial in a cultural sense, but exposure to the air will sweeten almost anything, even some of our mineral poisons. I do not affirm that decayed vegetable matter, unless in a very unusual form, is at any time deleterious to vegetation, as has been sometimes asserted; and to those who doubt the fertile qualities of leaf mould, just let them examine a heap that may have been lying some time near the roots of a vigorous-growing timber

tree, and the mass of roots found permeating it in all directions will prove there is something in it which the tree likes.

Passing now from the consideration of leaf mould as a natural manure I will turn to it in another aspect—as an ingredient in composts. Although I have been for many years opposed to the use of most of the mixtures that have been recommended for special purposes, preferring on almost every occasion to confine myself to some simple material, with, perhaps, the addition of sand, I am aware that most plant-growers have their favourite compost, and in many cases leaf mould forms an important constituent. Mr. Wright has called attention to the excellent growth of Camellias in Belgium where the soil employed is considered to be leaf mould alone, and the question naturally arises, Cannot the same result be attained in this country? It has for many years been known, or at least supposed, that the dark-coloured material in which are grown the healthy little Camellias sent over from Belgium is more of a leaf mould than a peat. Nothing can look better than they do in Belgium, but as Mr. Wright has justly put it, how few of them present the same appearance after twelve months in England! and occasionally a hint is thrown out that the growth is by no means prolonged in such a way as to exhaust the soil in which they are grown, and that they begin to go back immediately they are put into other hands. Certainly they very often do go back, but whether to blame our continental friends or ourselves is one of the matters we have now to consider.

For my own part I may say that I neither give the soil they are grown in abroad the whole of the credit of their looking so well, nor do I altogether blame the altered material in which we are obliged to pot the plants when we receive them as being the cause of their doing so badly; the change may be only partly due to this cause, the other and by far the more important one I have no hesitation in saying is water. I only wish some of your scientific readers would investigate its effects; it would be of far more service than minute details as to the mixing of soils and the like, for to plants in pots water is of much greater consequence than soil. A friend of mine having access to the best peat that it was possible to procure was unable to grow Heaths well, and ultimately gave up the attempt, as he had no means of supplying them with water except that which was drawn from a deep chalk well, which was slow poison to the Heaths. There are plenty of country places where the water is of this kind, and there is no alternative but to use it. In most cases suburban residents are supplied from waterworks with water better suited to vegetation; indeed, I know that the water furnished to more than one large town is better for plants than that from wells in the neighbourhood. Now, in the culture of a plant requiring so much water as the Camellia, it is of the utmost importance that it should be of the description best suited to it, and such, probably, is that furnished to the great Belgian establishments, hence the success. Though the same conditions do not exactly apply to vegetable as to animal life, still there is a certain analogy between the two, and just as bad water may be destructive to the latter, so it may be in a greater or less degree to the former; and till we can by some simple process purify water containing matters injurious to plants we must submit to seeing them languish under the poison.

While referring to leaf soil for the Camellia, I may remark that some years ago I had a few plants from Belgium which, like all others I have seen from there, appeared to be grown in that material, and desirous of trying the effects of our own leaf mould, I took the most decayed portion from the outside of a heap of considerable age and size. Thinking it might not be firm enough in texture, I mixed with it a little mud that had been taken from a pond receiving a large amount of house sewage, and a quantity of leaves also. This was a rich manure in its way, as its effects on grass land and other crops indicated, and I concluded it would not injure the leaf mould by anything it might contain. A little drift sand was also added, the whole being fine, and in a fitting condition. The result, however, was not satisfactory; whether owing to the character of the mixture or from the quality of the water I am unable to say, but I should be strongly inclined to blame the latter, as some plants subsequently turned out of doors in the same material, and which had no water except from the heavens, succeeded pretty well. I should say that a good, firm, sandy loam, such as is often met with overlying the red sandstone, will do better for Camellias than any mixture I know, and for mixtures I am no advocate, especially that of peat and loam, so often recommended.

But to return to leaf mould. I cannot perceive how it is likely to be hurtful to anything; true, its want of solidity would seem to unfit it when used alone for pot-culture, as it cannot be expected to furnish so lasting a source of food, unless, as I imagine is the case with our Belgian friends, its defects are compensated for by the water. As an addition to stiff soils its uses seem to be too well recognised to allow of anything serious being said against it. At the same time when it has been so much extolled for the effects it produces, it would be well to ask what share water had in the result. When our knowledge shall have been more extended in this direction, we shall probably find out that many plants for which particular soils or mixtures were necessary can be better managed by supplying them with the kind of water they require.—J. ROBERTSON.

## THE ROYAL HORTICULTURAL SOCIETY'S ANNUAL GENERAL MEETING.

FEBRUARY 10TH.

This was held on Tuesday in the Council-room, South Kensington, Viscount Bury (the President), in the chair. Amongst those present were Lord A. Churchill, Sir Alfred Slade, Bart., (Council), Sir Coutts Lindsay (Council), Mr. Hardcastle, Mr. Godson, Rev. C. P. Peach, Mr. Dobree (Council), Mr. Liggins, Mr. Cole, C.B., Major-General Scott, Mr. Quilter, Mr. Godson, Mr. Bowring, Mr. Bateman, Mr. Shirley Hibberd, Mr. Houghton, Mr. W. A. Lindsay (Hon. Sec.), &c.

THE SECRETARY read the advertisement calling the meeting, and then the minutes of the last General Meeting, which were confirmed.

THE CHAIRMAN said the first business—the first formal business—they had to transact was to appoint scrutineers for the purpose of deciding upon the result of the ballot for the extraordinary vacancies in the Council. The ballot list, he supposed, was in the hands of the members, and he need not read the names. He wished, however, to say that there were no ordinary vacancies in the Council. The Council supposed that as three members of the late Council declined to accede to the wishes of the Society expressed on the 4th of April that they would retain their offices, it was not necessary to do anything more than to fill up the vacancies so created. However, the matter was investigated. It was referred to the legal adviser of the Council, and they had been advised that three members of the Council ought to resign, or ought to have resigned. Their legal adviser said it was too late to do it now. However, he would read the opinion for the meeting. The Council wished to act in accordance with the wishes of the Fellows, and would be very happy to remedy the mistake, which, however, they were informed, was of no real importance. The question submitted to counsel was this—“What the Council can now do, and what they should do at the General Meeting on the 10th of February as regards the balloting list, &c.?” Now, the opinion of counsel was as follows—

“I am of opinion that a vacancy by resignation is not equivalent to a vacancy by death or incapacity within the meaning of the 10th clause of the Charter or the 85th bye-law, and that a mistake has been made by the Council in stating that there are no ordinary vacancies and in making no provision for filling such vacancies. This mistake does not, however, in my opinion, affect the validity of what the Council has done and proposes to do. The ballot list for Council is valid and may be acted upon. The objection to it is that it does not go far enough, and nothing is done to rectify the mistake which has been made. The 8th clause of the Charter and the 115th bye-law prevent the mistake from causing serious consequences, and notwithstanding the mistake the acts of the new Council will be perfectly valid. Under these circumstances I advise the Council to proceed with their list, but to admit the mistake which has been made as to the ordinary vacancies, and to explain to the meeting that it was impossible to rectify the mistake in time, and to say that the Council is advised that the mistake is of no real consequence, and need not be rectified at all, but that if the Fellows wish it three members of the Council will retire and a special meeting will be called to elect successors to them. If they desire this to be done, the Council, having made a mistake, ought, I think, to comply with such desire.

“With respect to Mr. Haughton's second letter, it proceeds upon the erroneous assumption that the appointment of the present Council was invalid, and his proposals, as contained in that letter, should be opposed. As regards the debencures of the old Society, I am of opinion that they are as binding on the present Society as they were on the old Society.

(Signed)

“NATHANIEL LINDLEY,

“6, Stone Buildings, Lincoln's Inn.

Now, continued his lordship, that was the opinion of counsel, which he had read to the meeting.

MR. HAUGHTON said his objection was founded upon the 110th bye-law, which required that if any Fellow desired to substitute the name of any other Fellow for that of any one recommended by the Council, such Fellow must, seven days after the circulation of the list, leave notice on the Society of the proposed substitution. Now, that was to say that the present meeting would be deprived of its undoubted right to put in three other members if the list was framed in the proper way. He could not nominate the gentlemen he wished to have elected. That being so, it appeared to him that although Mr. Lindley's opinion was quite correct, there was no inconvenience or danger to the

Society, yet that this meeting would be deprived of its right to elect members on the Council in a due and proper manner. Now, there was another question—

The CHAIRMAN.—I do not want to interrupt the gentleman who seems to have something to say [a laugh]; but the Council wish to state that if what is proposed is not agreeable to the meeting, and if what the honourable gentleman says is in accordance with the views of the meeting, we shall forward those views in every way [cheers]. Three of us ought to resign, but we were misinformed. Three of us will resign. The question is, Will gentlemen leave things as they are? It is a matter of perfect indifference to the Council [hear, hear].

A FELLOW.—I put it to the vote.

Mr. HAUGHTON was very much afraid they had no power to adopt the suggestion at that meeting. Mr. Lindley referred to the 115th bye-law, which applied to cases where there had been no election or an invalid election; but that bye-law did not enable them to elect the three they ought to elect that day, unless they gave notice in accordance with the 110th bye-law. He was afraid if the election were made by the Council it would be invalid. The proper course would be to adjourn the business to another day [hear, hear, and "no"].

The CHAIRMAN.—I put the question whether the Fellows desire this to be done. Mr. Lindley says it is not necessary, and the Council say it is a matter entirely unimportant to them. They wish to comply with the wishes of the Fellows [hear, hear]; for I put this to the meeting, that we are willing to admit we committed an inadvertent mistake, and in order to remedy it we will ballot out if the meeting wishes it [hear, hear]. However, Mr. Lindley thinks it is not important, and therefore the meeting will take their own course. Those in favour of balloting out, and thereby remedying the mistake, hold up their hands [one hand held up]. Those in favour of the matter remaining as it is hold up theirs [a large number of hands held up]. Carried [laughter]. The meeting has determined that the matter shall rest as it is [interruption, and cries of "no" and "yes"]. The next thing we have to do is to request Mr. Lindley and Mr. Pincher to act as scrutineers.

Mr. HAUGHTON.—I think this is the proper time for me—

The CHAIRMAN.—I think the meeting will consider it better that I, the President of the Society, should say a few words and conduct the business in the ordinary manner. In point of fact, I want to say a few words before the formal business of the meeting begins. We are in a critical position in this Society. You remember that a few years ago a proposition was made by which the gardens were to be disposed of in such a way as we thought would be very much for the benefit of the International Exhibition and very little for the interest of the Fellows of the Horticultural Society. Upon this a division of opinion arose, and the old Council resigned. The present Council—[A voice, "Members are not to ballot"—Uproar.] I appeal to you, ladies and gentlemen, to support me in the chair [cheers]. I was making a statement of the fact that differences of opinion have arisen, and that a majority of the Fellows placed the present Council in office, and their distinct duty and policy was so to arrange matters as to preserve the gardens of the Royal Horticultural Society for the use of the Fellows of the Society [cheers]. The new Council have, in the face of very great opposition and very great difficulty, carried out that policy to the best of their understanding and power. They felt that it was exceedingly necessary to enter into cordial arrangements with the Royal Commissioners, and with that view and with that reason, within a very few days a Committee of their body met a Committee of the Royal Commissioners, and agreed with them on certain terms by which mutual advantages would be obtained. From the very first it was asserted on the part of the Commissioners that your Council as at present constituted was not a legal body. We felt when we met the Commissioners that it would be utterly futile to enter into any arrangement with them, and then let it be in their mouths to say that we entered into it; but that as we were not a legal body, it went for nothing. In one part of the arrangement was inserted a clause by which the Commissioners were bound that they should not be the parties to raise the question. The Committee of the Royal Commissioners agreed to this, and upon that agreement we at once placed them in possession of all the advantages they derived under the agreement, and we ourselves entered into the possession of advantages which accrued to us. But when the matter was remitted from the Committee of the Commissioners to the Commissioners themselves, several points in that agreement were struck out, and one of them was the clause which stated the Commissioners would not question the legality of our appointment. I need hardly say that we should not have considered ourselves at liberty to place the Commissioners in possession of advantages under the agreement unless we believed the whole of the agreement was going to be acknowledged by the Commissioners [loud cheers]. We regret very much, although we cast no imputation upon them, to have to say that they have steadily and persistently, although placed last year in possession of all the advantages under the agreement, disregarded that por-

tion of the agreement I have referred to, and have declared that we are an illegal body and that they could not deal with us [oh! and "shame"]. But if this is so, why should they give us thousands under the agreement? They gave us certain advantages and we gave them certain advantages. The position is this, if we quarrel among ourselves the all-devouring element of South Kensington will swallow us up, and our gardens will be taken from us, and we shall be turned out. We want you, if you agree with us, to put such confidence in us as will be sure to make us successful to resist all attempts against the integrity of your gardens [loud cheers]. The bone of contention is the possession of these gardens [loud cheers and "no"]. I warn you in time that if you are not very much on the alert these gardens will pass out of your hands. Now, gentlemen, there are several matters which we are told are going to be brought before you to-day. I conjure you not to quarrel over these matters, but to defer them until a more fitting opportunity. Let us go on in the policy we have begun, and then, I think, we shall bring it to a successful issue. Now, gentlemen, there is one question of very great importance—the question of voting by proxy. I do not conceal from you that there is a difference of opinion on that point among the members of the Council. But a very strong expression of opinion was passed on that subject at a late meeting in favour of voting by proxy, and all I can say is that the Council, having taken this matter in hand, have no objection to draft a bye-law—such a bye-law as would tend to improve the relations between the Royal Commissioners and the Fellows of the Horticultural Society [loud cheers]. We hope that will satisfy you. The Council undertake, and you may consider this a pledge on their part, they will not canvass against the motion, or ask for proxies against it, or do anything to interfere with it, but each individual member will reserve to himself the right to discuss the matter when it comes before them. I hope that will be satisfactory [cheers]. I really do not know of anything we are to do but to renew our appeal to you that you should throw away all dissensions and work for the common good, and also—I will not say against the common enemy, for we wish to be friends [laughter]—but to avoid new danger. I can only say for myself and colleagues that the work at this table and up-stairs has been done most assiduously for the last year, that it is very hard labour, and that it is somewhat thankless [hear]. We cannot have any personal interests in the matter further than wishing to see these gardens as open spaces and unbuilt upon in the hands of the Horticultural Society [loud cheers]. All I can say is, if you disagree with our policy you displace us by others, and if any question brings that about I for one shall retire into private life with the most assured feeling I had tried to do my duty, but that I have been relieved from a very considerable and very arduous work [loud cheers].

Mr. HAUGHTON said he should like to refer to bye-law 90.

Mr. GODSON.—Move the report and second it [laughter].

Mr. HAUGHTON rose amid loud cries of "chair, chair," and "order." He could not obtain a hearing, and after some further interruption,

The CHAIRMAN said, We do not want to stifle discussion. Every one here will have an opportunity of speaking, but pray let us proceed in a proper and business-like way.

The Honorary Secretary, Mr. W. A. LINDSAY, was about to read the annual report when, by the unanimous consent of the meeting, it was taken as read.

The CHAIRMAN.—I now beg to move the adoption of this report.

Sir COURTIS LINDSAY seconded the proposition.

Mr. HAUGHTON said he had an amendment to move to the following effect:—"That this meeting and business proposed to be transacted thereat be adjourned to Tuesday, 10th March next, at 3 P.M., to enable an opinion of the Court of Chancery to be obtained, if possible in a friendly way, as to the legal position of the Society, and that Lord Alfred Churchill, Sir Daniel Cooper, Bart., Messrs. T. Dyer Edwards, H. J. Veitch, and G. F. Wilson, jointly and severally, be empowered to act on behalf of this meeting in applying to the Court of Chancery, and to co-operate with others." Mr. Haughton said he was perfectly aware of the unusual nature of the proposition he had made. He hoped they would listen to him patiently for a very short space of time while he expressed to them the reasons which, in his mind, rendered it absolutely necessary that some extraordinary steps should be taken to extricate the Society from the position in which it now stood. The noble lord in the chair had told them how this difference of opinion, which unhappily existed, arose last year in consequence of the action taken by some of the Fellows of this Society when the report was laid before them by the Council. Many of them were there to-day, and he felt that if they had not the circumstances fresh in their recollection they must have the strong and violent language used in that room, language which he was not going to follow [cheers]. He might say that he now very much rejoiced when the Council, with their Chairman, came before them and had laid aside that position of open hostility they displayed when they last met there [hear and cheers]. He was glad

to hear a hearty response to that sentiment [hear, hear]. When this difference of opinion arose on the subject matter of the agreement proposed for the advantage of the Society, it appeared the agreement could have been negated without any tumult. Instead of the agreement being negated in the interest of the Society, the Council was attacked, strong language was used, motives were imputed to them; they were charged with conspiring with other persons to ruin the Society, with being false to their trust as trustees, and with acting as gentlemen would not and should not act. That being so—yielding to what was being done, and feeling they could not sit with honour at the table as trustees to be abused, these gentlemen said, "If you like we will resign"—that is, "we will resign if we have the power" ["oh, oh"]. He would give authority for what he said. He had the highest authority for what he said. To come back to the point. They said, "If we have the power to resign we will be only too glad to do so, and to get out of the position in which we are placed," and they did so accordingly. At another meeting—not an annual meeting, or one having power to entertain the question—they brought forward a bye-law framed with the object, and enabling them to resign in a body. Now, if that bye-law were good, the gentlemen now sitting behind the table were legally elected, subject to another consideration, that before they could be elected into their present places there should be vacancies of the places they filled. In the acceptance of the resignation of the old Council the voting was taken openly, whereas the bye-law made it imperative it should be taken by ballot. That being so, it was a matter of doubt whether the meeting could legally accept these resignations. Again, if the bye-laws were beyond the power of the Society, or repugnant to the charter of the Society, then he asserted equally these gentlemen had no right to sit where they did. Another point—the Council had secured the opinion of a man of high eminence in his profession, but he had before him an opinion given by a gentleman who was at least of equal, if not superior, standing in his profession, he meant Sir G. Jessel, the present Master of the Rolls. It was quite true that in the circular sent out some time ago by Mr. W. A. Lindsay the opinion of Sir J. D. Coleridge and Mr. Lindley was given, in which they said "The opinion of the Solicitor-General, as set out in the case, appears to us to be a mistake, as—

The CHAIRMAN.—Read it.

Mr. HAUGHTON (reading).—"We are of opinion the new bye-laws are valid and legal [cheers], and the new Council is duly and properly appointed [cheers]. The case really turns upon the effect of the 10th clause of the Charter, and we are of opinion that the new bye-laws are consistent with and not repugnant to that clause [renewed cheers], and the opinion of the Solicitor-General as set out in the case appears to us to be upon, as it were, a question of validity."

The CHAIRMAN.—The meeting will perceive that that opinion is signed by Sir John Duke Coleridge and Mr. Lindley [hear, hear].

Mr. HAUGHTON went on to say that the question submitted at the time to Sir G. Jessel, when he was Solicitor-General, was whether it was competent for the Council to resign in a body, and if the Fellows at a General Meeting could appoint a fresh Council, or whether the resignation of the Council in a body would leave the Society without a government. The reply was, "I think this can be only done at the February meeting." The second question was, "Can the appointment of an entirely new Council be legally effected by an alteration in the bye-laws?" The answer was, "I think it can by a bye-law authorising the Council to fill up vacancies by resignation between the February meetings; the Council so appointed is re-eligible in the following February." That was to make a temporary appointment until the succeeding annual meeting had full power to deal with the question. The third question was, "Can the suggestion of partial retirement and gradual filling-up of vacancies be adopted if the Council thinks fit, under an amendment of bye-laws, without waiting for the annual meeting?" The reply was, "I think this can be done as above-mentioned." Now, the question was whether members elected on the Council at the General Meeting—another Council then constituted—was authorised to carry on the affairs of the Society. The answer was, "I am of opinion that they were not duly elected, even if such a bye-law as that was passed on the 26th March, 1873, was not repugnant to the Charter; yet it would not have been legal, not having been passed in the mode prescribed by bye-law 127, and therefore the election was not legal, and the old Council remained in office." [Cheers and counter cheers.] The second question was whether members of the Expenses Committee appointed on behalf of the Horticultural Society had been legally appointed on the Committee, and whether the Society should be bound by the resolution passed? The answer was, "I am of opinion the old members of the Expenses Committee remained in office. They do not appear to have resigned their office as committeemen." The third question submitted by the Commissioners was, Whether an agreement entered into between the Royal Commissioners and the Society, as before stated, might not, in case

the present Council and the Expenses Committee were not legally appointed, be hereafter repudiated by the Society?

Mr. LIGGINS rose to order. The Fellows had assembled for a particular purpose, and not to hear legal opinions, which were decidedly irrelevant ["no" and hear]—legal opinions got up by a clique [cries of "order"].

The CHAIRMAN.—The gentleman (Mr. Haughton) need not be alarmed—I think he is quite in order [hear, hear].

Mr. HAUGHTON said he should be sorry to take up the time of the meeting unnecessarily. He only did take it up because they were told Sir George Jessel's opinion sustained the legal existence of the Council. If he were to give a short *résumé* of the opinions, he might be charged with suppressing something [no, no]. Well, the answer to the last question was—"It does not follow it might in all cases so repudiate because it is not legally binding; but I am of opinion it would not be legally binding." Now, the opinion he had just read was a justification of the action of the Commissioners; for having taken that opinion, they conceived themselves bound by it, and so could not enter into business relations with the Society [cries of "oh"]. They could not recognise it; and until this question was settled, the action of the Society as far as regarded the out-door world as to the privileges of these gardens must be paralysed. No one would deal with them—no one would recognise them. He should conclude by saying it was not for that meeting to determine whether Sir John Duke Coleridge and Mr. Lindley on the one side, or Sir George Jessel on the other, be in the right. It ought to be sufficient for them to know there were such grave doubts that a distinct difference of opinion existed between such eminent authorities [hear, hear]. They ought not in that room presume for themselves who was right and who was wrong, or decide such a grave question of law which went to the very root of the Society. The Council, he thought, ought to unite with his friends and himself in endeavouring to place the legal position of their governing body beyond all dispute [hear, hear], and to determine what the status of that body was, so as to enable them legally to transact their duties [hear, hear]. He could not understand the opposition offered to this course. He thought they might all unite and act with temper and forbearance [cheers]. He now begged to move the amendment as follows:—"That this meeting, and the business proposed to be transacted thereat, be adjourned to Tuesday 10th of March next, at 3 p.m., to enable the opinion of the Court of Chancery to be obtained, if possible in a friendly way, as to the legal position of the Society; and that Lord Alfred S. Churchill, Sir Daniel Cooper, Bart., Messrs. T. Dyer Edwards, H. J. Veitch, and G. F. Wilson jointly and severally be empowered to act on behalf of this meeting in applying to the Court of Chancery, and to co-operate with others."

The Rev. C. P. PEACH rose to second the amendment. He said his object in being there was to represent to a certain extent the feelings of the country Fellows, who were being alienated from the Society because they did not know the position in which it stood. They thought that no bye-laws could be passed by the Society if it had not a legal Council, and therefore it was necessary to know what the position of the Society was, and whether they had a legally constituted Council or not. He did not say this with any idea of opposing the Council. He was anxious to strengthen their hands, and if the legal opinions were in their favour they would strengthen their hands. On the other hand, he could only say that it was necessary for the welfare of the Society that they should have a legally constituted Council, and therefore it was best to go to the highest authority and see whether the Council had the power to accept what the Commissioners did, and whether the Commissioners had the power to accept what the Council did. The Fellows in the country did not really know whether the Council had power to receive subscriptions.

The CHAIRMAN.—I want to say one word. I wish that the Society should be placed in possession of this fact, that this resolution is, I suppose, the resolution of the Royal Commissioners [cheers, cries of "no," and interruption].

Mr. HAUGHTON.—It is not [cheers].

The CHAIRMAN.—The two persons who circulated it came in with the pass of Mr. Richards, the Assistant-Secretary of the Commissioners. Mr. Richards is here, and you can ask him.

General SCOTT.—The Commissioners have nothing whatever to do with the resolution. No single member of the Commission has ever seen that resolution or heard of it [cheers, and oh, oh].

The CHAIRMAN.—Therefore you should keep Mr. Richards in order, and not allow him, with tickets which were disputed, to come in here and circulate papers against the Horticultural Society [cheers].

Lord A. CHURCHILL.—The resolution was adopted at a meeting of the Fellows yesterday.

The CHAIRMAN.—This circular asking for proxies is signed by James Richards, and he is an officer of the Royal Commissioners.

The Rev. C. P. PEACH.—I have no knowledge of Mr. Richards having anything to do with it at all. I was yesterday asked to second the resolution in the interests of the Society.

The CHAIRMAN.—We must, I suppose, accept the disclaimer of the Royal Commissioners. At the same time you know the affairs and finances of the Society are not in a very flourishing condition, and if you get into Chancery where are the funds to come from? That is all I say [applause].

Mr. DOBREE (Treasurer) said he went to the Albert Hall to see Mr. Richards, and having waited some time was asked his business. He said he had come to see Mr. Richards on horticultural matters, and that he was the Treasurer of the Society. The person he spoke to looked at him and said, "Do you want to know what they are doing? [laughter]. They have taken another opinion," he said, "and they are going to send out another opinion with the circular. They have taken another opinion from Sir G. Jessel, and Sir Daniel Cooper is going to send it out with a circular" [laughter]. Therefore he (Mr. Dobree) contended that the circular was sent out on the authority of the Royal Commissioners [hear and no].

Mr. SHIRLEY HIBBERN said the promoters of the amendment had not provided the Society with the means of going to law. It was absurd to talk about going to the Court of Chancery. Did the gentlemen know what a Chancery suit would cost? [hear, hear]. Did he wish to break his own or their hearts and spend every shilling they got, and in the end to be as wise as they then were? The Commissioners had transacted business with the Council and the Council with the Commissioners, and if the Commissioners could recognise the Council when it suited them they must also recognise the Council when it suited the latter [laughter and cheers]. Who were the men now opposing the Council? Those who invited them to come in ten months ago [no, no]. The men who had brought them into a thousand difficulties had been plotting against them. He thought they ought to support their Council, so that something like a sensible arrangement might be made with the Commissioners. That was the principal business before them [hear, hear].

Mr. LIGGINS observed that it was then past four o'clock, and they had no longer power to continue the ballot.

The CHAIRMAN announced that the list recommended by the Council had been unanimously adopted. It was as follows:—Extraordinary vacancies.—Vacating members, H.R.H. Prince Arthur, H.S.H. Duke of Teck, Lord Londeshorough, and Mr. Andrew Murray. Fellows proposed by the Council to fill up the vacancies, Lieut.-Gen. Hon. Sir A. H. Gordon, K.C.B., Mr. Joseph Robert Tritton, Mr. Burnley Hume, and Mr. H. Webb. Officers:—President, Viscount Bury. Treasurer, Mr. Bonamy Dobree. Secretary, Mr. W. A. Lindsay. Expenses Committee-men, Sir Alfred Slade, Bart., Mr. W. A. Lindsay, Mr. H. Little. Auditors, Mr. James Nicholson, Mr. J. Gibson, and Mr. R. Hudson, F.R.S.

Mr. LIGGINS said therefore there was no doubt now the Council were legally elected [hear, and laughter]. They had now a legal right to sit and work with diligence and activity to carry out the best interests of the Society. Their very first effort should be to break down the clique headed by Major General Scott, Mr. Bateman, Mr. Cole, and Lord Alfred Churchill, who had circulated among the Fellows such papers as were seen in the room that day. If it went forth that the Society was going into Chancery, people would not join it [hear, hear]. They should support the present Council. Why, if these gentlemen thought they had the shadow of a chance of electing their own set did they not do so at that moment? He thought it was monstrous that Mr. Richards, an old servant of the Society, who was greatly respected, should betray them in such a way. Let them support the Council and the President, who did not neglect the business as the late President did.

Lord A. CHURCHILL remarked that the meeting had just elected four additional members of Council more than were provided for by the Charter. He maintained that there were no vacancies.

The CHAIRMAN said the Council were acting under legal advice.

Lord A. CHURCHILL.—Well, the amendment was for a friendly reference to the Court of Chancery to decide the dispute. There were strong legal opinions on both sides of the question. Sir George Jessel gave it as his opinion that the old Council still existed, and as one of the old Council he felt in an uncomfortable position, because, as certain gentlemen were spending the money of the Society, he did not know but some day or other the money would be run through, that the debenture interest would not be paid, and that then the debenture-holders would come upon the old Council for the money which had been spent [no, and laughter]. It was perfectly reasonable that the meeting should now agree to a friendly reference [no, no]. If it were decided that the present Council were the legal occupiers of the office he would give them all the support he could, but if not the old Council must return. It was a question of law, and if handled in a friendly way could be decided without any expense at all.

A Provincial FELLOW said there was a strong feeling in the country about the withdrawals of the Saturday tickets.

Sir A. SLADE said that as to the Fellows' orders on Saturdays and the 1s. charge, the present arrangement would last for

one year. Many persons would come to the gardens when the admission was 1s. Oftentimes five hundred orders came in, but not a shilling in money.

A Country FELLOW.—We look upon it as a breach of faith.

Mr. LINDSAY (Hon. Sec.)—It is the desire of the Council to make the gardens more popular with the public on holidays. Every Fellow received, or ought to have received, a table of his privileges previous to paying his subscription.

Mr. BOWRING, as a Royal Commissioner, wished to state that neither he nor any other member of the Commission had anything to say to the issue of the circular referred to. He held the office of Treasurer to the Commission, and it was his duty to receive £2400 from the Horticultural Society which had never reached him [a laugh]. He had only £1000 handed over to him, which showed an alarming deficit. He was a life member and debenture-holder of the Horticultural Society, and no person could take greater interest in the gardens than he did. He had served for many years as honorary secretary of the Expenses Committee, and this would show he had a strong personal interest in the welfare of the Society. He wished, however, to say he was the only survivor of three individuals whose duty it was to bring about the existing arrangement between the two bodies. These were the late Prince Consort, Mr. Coulson, and himself. The Commissioners spent no less than £55,000 in the arcades, and they added two sums of £13,000 and £10,000, which made £78,000 expended in promoting the interests of the Horticultural Society. Had they acted as ordinary landlords and tenants they would have had to receive a large sum of money, but the only sum they received for property worth some £300,000 was £516 15s. 9d. The Commissioners had received nothing by way of rental, but by way of interest. He thought it a grave question whether the lease of the Society had not already fallen through [oh]. In two years from the present time, if there should be no payment of rent, the real question would be whether the forfeiture of the lease would not arise. The debentures of the Society could not be worth a single farthing, and the Commissioners would distrain on every article—the arcades, the conservatories [no, no], the trees, and the shrubberies, which were also distinctly specified as being forfeited to the Commissioners in case the rent were not paid. That was a very serious matter [hear, hear]. He deeply regretted that the Council should have placed themselves in hostility to Her Majesty's Commissioners, but when he saw the extraordinary step taken by the present Council when the Commissioners made arrangements for letting on lease a certain amount of their land, he was astonished. Instead of going to Her Majesty or the Home Office, the Council petitioned the two Houses of Parliament to prevent the Commissioners doing the very thing they had the power by their Charter to do. And four out of the five reasons they laid before Parliament were reasons which applied equally to the great national buildings about the gardens as to private buildings. The late Prince Consort would never have allowed this agreement to have been entered into unless with the understanding that the gardens should be surrounded with buildings. He hoped the meeting would agree to the amendment [no, no]. One of the last meetings of the Commissioners took place at Marlborough House, under the presidency of H.R.H. Prince of Wales, and then they had the opinion of Sir G. Jessel telling them that the present Council was not legally elected. Under that it was impossible for the Commissioners to ratify any agreement with a Council not legally elected. He had moved that the whole of the recommendations with the exception of this one should be adopted, it was seconded by the Duke of Edinburgh and passed; and so much for acting in hostility to the Society.

Mr. W. A. LINDSAY (Secretary), remarked that the Commissioners had refused to pay the Society £1043 due to it. In 1872 the late Council made a mistake by paying £1200 to the Commissioners on the understanding that if it was found there was not a sufficient surplus to pay the rent it should be refunded, but it had not been [hear, hear]. As to the Commissioners refusing to ratify the arrangement, it was not a matter for the Council, as the Board of Management represented the Commissioners. The fact was, that Mr. Cole objected to deal with them unless they were empowered by the Council to deal with him, and stated that he and Dr. Lyon Playfair had power to negotiate. If the Committee of Management chose to repudiate Mr. Cole's action on that occasion, Mr. Cole ought to have resigned his appointment. When he referred to the fact that upon one occasion the late Council expended £500 upon a statue, he asked whether that was a proper way to administer the funds of the Society? There never was so careful a statement of accounts as that presented this year, and there never was a Council which tried more assiduously to forward the interests of the Society [hear, hear]. As to the amendment, they were quite certain the Council had been rightly elected, but if it was the desire of the Commissioners to institute a suit against them they could do so. It was evident a large majority were in favour of the course proposed by the Council [hear, hear].

Mr. BATEMAN, with reference to Mr. Bowring's remarks, said

he had found, by refreshing his memory, that instead of the Society coming as a suitor to the Commissioners, the Commissioners, at the time when the Society was in great difficulty at Chiswick, were contemplating the preparation of the central part of the land at South Kensington as a garden, to be surrounded by Italian arcades, and had conceived the plan of doing what the Horticultural Society were afterwards made to assist them in doing. It was therefore above all things necessary that the Fellows should form an accurate judgment of the rights of the case between the Society and the Royal Commissioners [hear, hear].

Mr. QUILTER thought the best course was to adjourn the meeting for a month [no].

Mr. GODSON had arrived at the opinion that the Council had not been legally appointed, and they ought to put the Council in a proper position. He should now move—

The CHAIRMAN.—You are out of order. You cannot move an amendment upon an amendment; you must dispose of the amendment first [hear, hear]. I shall now read the amendment.

The amendment was then put, and on a show of hands there were—

For the Amendment .....	52
Against it .....	71

Majority against it .....

Mr. COLE demanded that proxies should be taken.

When the proxies were counted the poll stood thus—

For the Amendment {	Show of hands .....	52
	Proxies .....	173
		—225
Against the Amendment {	Show of hands .....	71
	Proxies .....	160
		—231

Majority against the Amendment..... 6

The announcement of the numbers was received with cheers.

The CHAIRMAN then put the motion for the adoption of the report, which was unanimously carried.

Lord A. CHURCHILL moved that the resignation of the old Council be now accepted.

The CHAIRMAN.—That was done at a former meeting.

A vote of thanks was then given to the noble Chairman, and the meeting then separated, having lasted over two hours.

At the Annual General Meeting of the Royal Horticultural Society, held on the 10th, my name was so freely used by some of the speakers, that I feel you will allow me the opportunity of writing my defence. I was accused of "plotting against the Society," and one member who sat behind the table told me "I was not a Fellow, but an honorary member," "that I had no business in the room, or power to pass anyone into the Gardens," and that "if I was not ashamed of myself I ought to be, as I had acted most disgracefully, &c." I affirm that the Society unanimously elected me a forty-guinea life Fellow, in consideration of which I hold two transferable tickets, with certain privileges. The latter part of the accusation must be answered at more length.

I have been intimately acquainted with the business of the Society for thirteen years, during which time many clever horticulturists and financiers have sat on the Council. At the end of my connection with the Society the old Council had been replaced by gentlemen, the validity of whose elections had not only been questioned, but the resignations of their predecessors disputed by eminent legal opinions. As a well-wisher of the Society I consider that these doubts should be placed beyond all question, and therefore I did not hesitate to act with Lord A. Churchill, Sir Daniel Cooper, and others, in trying to induce the Fellows seriously to go into the matter, either by means of a friendly law-suit, or the highest legal opinion obtainable; in fact, I did the secretarial part of the work, and some few of the circulars bore my name. A resolution was settled upon, and ordered to be printed for circulation amongst those attending the meeting, experience telling us that no fair hearing could be obtained or views explained with any clearness when the matter differed from the views of a certain section. For the above reason I passed two people on my tickets (not into the meeting-room, for that I knew to be wrong) to distribute the papers, and for these offences I have the latter part of the accusation made against me.

At the risk of hints as to the "decease of my trumpeter," I cannot help adding in conclusion, that so far from "plotting against the Society," I have been consulted by those in power upon many important points, to which I have never hesitated to

give my best attention and advice, besides devoting many weeks of my time in aiding the work of the Society long after receiving any remuneration. I do not regret this, far from it, and I only name it now to show I am not the traitor some (though very few I am happy to say) would make me out.—JAMES RICHARDS.

#### REPORT OF THE COUNCIL TO THE ANNUAL GENERAL MEETING.

The Council, in presenting their Report, have to congratulate the Society on the success of its operations during the past year.

The Chiswick Garden has been well kept up, numerous grafts of fruit trees have been distributed, and every effort made that they should be of the best kinds. An extensive trial of Potatoes and French Beans has been made, with a view to determine the best varieties and to settle their nomenclature. Every effort ought to be made in view of the interests of country Fellows to promote the efficiency of the Chiswick Garden. The Directors' Report is enclosed with this paper.

The Council announce, with great satisfaction, that Dr. Hooker, President of the Royal Society, has accepted the chairmanship of the Scientific Committee; and they take the opportunity to again invite Fellows to send for examination to the Society's Scientific, Fruit, and Floral Committees any specimens which may appear to be of interest or importance. The provincial Show held at Bath was a horticultural and financial success, but it is proposed to make very material alterations in the arrangements of future provincial shows, with the object of increasing their scientific value and social comfort.

At South Kensington the Shows have been very successful; the displays of pot Roses have surpassed those of previous years, among which Mr. Paul's enormous exhibition attracted great admiration, while the fine collections of spring and alpine flowers have greatly stimulated cultivation in those special directions. Messrs. Waterer's Rhododendron tent gave the public a great opportunity of selecting specimens of this tribe of plants, and to Lord Londesborough special thanks are due for displays of Orchids which were objects of universal interest and curiosity.

After consultation with some of the principal exhibitors it has been thought good to reduce the number of the shows, with a view of increasing their importance, and it is hoped that this course will meet with the unanimous support and co-operation of those interested in these arrangements.

To increase the public usefulness of the Gardens, it has been decided to reduce the admission fee on Saturdays to 1s., and to make Fellows' orders not available for that day.

An intimation having been conveyed to the President, in July last, that His Royal Highness the Prince of Wales desired the use of the Society's conservatory for a ball to be given to their Imperial Highnesses the Czarovich and Czarvna, the Council felt that they would best meet the wishes of the Fellows by at once placing the conservatory at His Royal Highness's disposal. In their opinion no precedent for the use of the Society's Gardens for any private purpose has been thereby created.

It is important for the interests of the International Exhibition, held yearly at South Kensington, that arrangements should be from time to time entered into with the Royal Horticultural Society for the purpose of facilitating communication between the two wings of the Exhibition building, and for the general convenience of visitors to the Exhibition and Gardens. Last year the present members of Council, who only entered upon their duties a few days before the opening of the Exhibition, found the Exhibition Commissioners very desirous to enter into some such arrangements. Committees, selected by the Exhibition Commissioners on the one hand, and by the Council of the Royal Horticultural Society on the other, met to negotiate these arrangements, and it was understood that both parties had full power to treat. Without such arrangements the Commissioners would have been unable to fulfil contracts with exhibitors already made, and without the sanction of the Royal Horticultural Society.

An agreement was accordingly entered into, and as a special act of courtesy to the Exhibition Commissioners, the Royal Horticultural Society consented to allow it to come into operation before it was finally executed. The Council have, however, to state with regret that the Commissioners having enjoyed the full benefit derivable from the terms agreed upon, afterwards refused to ratify important parts of the agreement.

The Council have deemed it advisable to employ the services of a professional accountant in making up the financial statement of the year. They now present the accountants' report—and a copy of the accounts, duly audited, may be had on application at the Secretary's office.

On 4th April the balances in the bankers' hands were:—

At credit of the Revenue Account .....	42265	19s.	9d.
Do. of the Provincial Show Account .....	21186	19s.	6d.

The Council found debts owing by the Society, some of them of not less than five years' standing, and amounting up to

January 1st, 1873, to £4026 18s. 5d. The most pressing have been met, to the extent of £3635 15s. 4d., but £391 3s. 1d. still remain.

All the liabilities of 1873 have been paid up, except a sum of about £3096 3s.

The Council have to observe that by the agreement of 1860 it was provided that the Expenses Committee, consisting of six members, three appointed by the Exhibition Commissioners and three by the Royal Horticultural Society, should meet from time to time to sanction the payments made by the Society out of the receipts from the Gardens. Since the year 1871, however, this Expenses Committee have not met, owing, during the past year, to persistent refusals to do so on the part of the Exhibition Commissioners.

In July, 1872, a payment of £1200 was made by the Society to the Exhibition Commissioners on account of rent, and in anticipation of the accruing surplus. To no part of this sum had the Commissioners any claim under the agreement of 1860 unless it existed as a clear surplus on the receipts of the year. At the end of the year only a part of this surplus existed; and although the payment was made under a distinct understanding that in this case the money, or any part of it not due, should be refunded, the Council, after many applications, have failed to recover from the Exhibition Commissioners the sum in question, amounting to about £931.

There is one item in the financial statement to which the Council wish to call the serious attention of the Society—the life compositions.

By the agreement of 1860 life compositions were authorised with the proviso that, during the continuance of the lives compounded for, one-fiftieth of the amount of such compositions should be chargeable in each financial year as part of the receipts of the Gardens. This composition money was for some years funded, but about ten years ago the then sum invested was spent.

So long as the actual receipts for life compositions in each year equalled this charge against the Society no inconvenience arose. As, however, the charge increased year by year, while the receipts under the head of life compositions diminished, the time at last arrived when the receipts no longer equalled the charge. Last year the deficiency was £161 2s., and this deficiency may annually recur.

Doubts having been raised as to the validity of the proceedings of the Meeting of 4th April last, which received the resignation of the old and elected the new members of Council, a case was laid before Mr. Lindley, Q.C., the standing counsel of the Society, and the late Attorney-General, Sir J. Coleridge. These eminent lawyers stated their opinion that the proceedings were perfectly valid, and the present Council legally elected.

In December last the Council received a requisition, signed by twelve Fellows, to call a Special General Meeting for the purpose of passing a bye-law enabling all Fellows to vote by proxy. This Meeting was held on the 8th January, and a motion was passed that the Council should re-enact a bye-law which, in the course of the preceding year, had been rejected by the Society. The Council consider that the question of proxy-voting will have to be argued on much more general grounds than those argued at the Meeting. They therefore intend to invite further discussion upon the question, when more of the Fellows are in London, and, pending the decision then to be arrived at, are unable to comply with the instruction carried at the Meeting of the 8th January.

#### REPORT OF THE ACCOUNTANTS.

"8, Walbrook, London, E.C., January 31st, 1874.

"To the Council of the Royal Horticultural Society, South Kensington.  
"GENTLEMEN,—In compliance with your instructions, we now beg to forward the revenue account of your Society for the year 1873, duly audited, and showing (after bringing forward the sum of £391 3s. at debit on the 31st December, 1872) a balance against the Society on the transactions of the past year of £441 15s.

"This amount has been increased by charging the account with £2341 7s. 7d. liabilities belonging to previous years, but paid in 1873, in addition to others, still outstanding, of £391 3s. 1d., so that the balance existing at the debit of this account on the 31st of December last, was £2474 5s. 8d.

"We have not prepared a balance sheet showing the position of your Society, as our instructions were not to that effect.

"To do this would necessitate the examination of many balances (representing very considerable amounts), which seem to have been carried forward for a long term of years, the thorough investigation and testing of which would be a work of great labour and very considerable expense.

"The balances at your bankers on the 31st December, 1873, was £375 19s. 1d.; and there was in hand (petty cash) on the same date, the sum of £3 4s. 6d.

"We are, gentlemen, yours faithfully,  
"C. F. KEMP, FORD, & CO."

#### REPORT OF THE CHISWICK BOARD OF DIRECTION, FEBRUARY, 1874.

The Board of Directors have to report that the garden labour at Chiswick, which for the last year or two has been very much directed towards the various works of re-arrangement, consequent on the recent curtailment of the area of the garden, has, by reason of the completion of those works, been available for other purposes, so that during the season of 1873 it was found practicable to take up a fair share of the experimental trials of

vegetables and flowers, for which, in conjunction with the supply of decorative plants for Kensington, the garden is now more especially designed. These trials were not indeed wholly suspended during the period when the alterations were in progress, but they have now again assumed in some degree the more extended form and comprehensive character which the importance of the subject demands.

In the Fruit and Vegetable Department the distributions to Fellows and correspondents of the Society comprise 60,000 packets of vegetable seeds and 1543 packages of cuttings of Vines and scions of fruit trees. Amongst the latter was an important collection presented to the Horticultural Society of Victoria, of which the officials of that Society report that "owing to the lengthened voyage of the ship by which they were forwarded, a large number perished."

A considerable collection of Cherry trees of pyramidal form were, some few years since, got together; but they proved to be extremely unsatisfactory, owing partly to the difficulty of efficiently protecting them; they have therefore been dispensed with, and have been replaced by young trees planted against the boundary walls, and which are to be trained as single cordons.

An extensive collection of pyramidal Plum trees, which had become too much crowded, have been transplanted and re-arranged at wider intervals so as to admit of their fuller development.

The trees planted out in the orchard-house had grown so freely that they had already become too much crowded; and as thinning-out in some form was necessary, the opportunity has been taken to lift and pot the pyramidal trees, chiefly Peaches and Nectarines, and to re-arrange the standards, which are still planted out. In this way the overcrowding of the trees may be more readily prevented by the temporary removal of the potted trees.

Many new varieties of the Grape Vine have been introduced to our gardens within the last few years, and it has been thought desirable to devote a house to the growth of these, with a view to a closer observation of their peculiarities and merits. The small curvilinear vine, in which the different sorts of White Muscats had been brought together some years since for a like object (which has been accomplished), has been set apart for this purpose.

The experimental trials and comparisons of the varieties of different vegetables have, during the past season, been taken up chiefly by such important subjects as Potatoes, Peas, and Kidney Beans. Of the Potatoes, the trial has been very complete and satisfactory, some 271 reputed varieties having been planted, though this number has been greatly reduced by ascertaining that many of the names are synonyms of others. Some of the more recent American varieties have proved to be highly meritorious, as have some of the English seedlings raised by Mr. Robert Fenn, of Woodstock; and nine first-class certificates have been awarded by the Fruit and Vegetable Committee. The trial of Peas has been a continuation of that of the previous year, and in this case five certificates have been awarded, all to novelties raised by T. Laxton, Esq., of Stamford. The trial of Kidney Beans, though only a partial one, has resulted in the award of five first-class certificates. These trials will all be duly reported on in the Journal.

It is proposed to recommend to the Committee to continue during the present year the critical examination of Potatoes and Kidney Beans, and to add thereto the varieties of Celery, which now seem to be in need of another revision, with the view of ascertaining which are the most profitable and meritorious.

In the Floral Department similar activity has been displayed. The distributions comprise 60,000 packets of flower seeds, 3325 plants allotted by ballot, and 873 packages of cuttings of plants; while for the Society's own use at Kensington 12,876 plants have been grown and furnished for the decoration of the Conservatory; 63,016 plants have been expended on the summer bedding, and 31,833 on the spring bedding of the past year. In addition to these, 37,917 plants have been supplied during the months of November and December to furnish the display during the ensuing spring.

The comparative trials of flowers have been chiefly amongst Zonal Pelargoniums (which are so numerous and important as to require annual revision), Fuchsias, Pentstemons, and Phloxes. Of the Pelargoniums no fewer than 522 varieties were planted out for observation; and amongst these, in their various sections, the Floral Committee distributed twenty-nine certificates. The salmon-coloured and white-flowered varieties of Pelargoniums not being found suitable for open-air culture, but being highly decorative as cool greenhouse plants, the Committee in 1872 desired that a trial of these as pot-plants should be made, and fifty-four varieties were thus grown, with the result that one was specially certificated, and a selection of the most useful of the remainder approved and recommended for in-door decorative purposes. In the case of Fuchsias 182 varieties were grown, and seventeen of these were certificated as desirable decorative sorts; while of Pentstemons and Phloxes large collections were planted out, and four of the former and seven of the latter were

selected for certificates. The report on these collections will be found in the number of the Journal just issued.

The collection of Hardy Herbaceous Perennials has been enriched during the season by the presentation of three hundred species and varieties from the Royal Gardens, Kew, and of numerous species of Aster from the Floral Director. Of these latter plants it was hoped that a large collection might be got together with a view to their examination by the Professor of Botany; and contributions for this purpose will still be gladly received by the Gardener-in-chief.

A very handsome new Fern, which sprang up in one of the propagating houses a year or two since, and which is now a well-developed specimen, has been described and figured during the past year in the Journal under the name of *Pteris serrulato-tremula*. It is very remarkable that this plant, supposed from its compound appearance to be a hybrid between *P. tremula* and *P. serrulata*, though forming spores in abundance, cannot, so far as yet experienced, be increased by this means, the typical *P. tremula* only being produced from them. It is probably, therefore, after all, only a spore-sport of this well-known plant.

Of other matters which have come before them, the Directors think it only right to mention that the Gardener-in-chief has reported most favourably to them of the action of a new wrought-iron boiler, erected by Messrs. T. Green & Son, which has done its work most efficiently and economically; and they are informed that a similar boiler is now most satisfactorily heating the Conservatory at Kensington.

Professor Thiselton Dyer's lectures to the young gardeners at Chiswick, on elementary matters of science bearing upon horticulture, and which were briefly referred to in the Report of 1873, were listened to with attention and advantage by the young men to whom they were addressed. It is much to be desired that instruction in the higher branches of horticulture should also be given.

#### STATEMENT OF ACCOUNTS from January 1st to December 31st, 1873.

EXPENDITURE.		£	s.	d.	£	s.	d.
Balance brought forward from 31st December, 1872					376	19	9

#### FACILITATING FERTILISATION.

I REMARK, in THE JOURNAL OF HORTICULTURE of January 29th, an article on the process indicated by my friend Mr. Daniel Hooibrenk, of Vienna, for facilitating the fertilisation of plants by touching the stigma with a pencil dipped in honey.

Although Mr. Daniel Hooibrenk has done everything in his power to make this process known, and has advocated it energetically, it is but just to state that he is not the inventor of the process, and that it was previously made known by the late Mr. H. Lecoq in 1862 in his work entitled "De la Fécondation Naturelle et Artificielle des Végétaux, ou de l'Hybridation."

Mr. H. Lecoq was at that time and till his death the Director of the Botanical Garden of Clermont-Ferrand.—JEAN SISLEY, Lyons.

#### CELERIAC OR TURNIP-ROOTED CELERY CULTURE.

THIS delicious vegetable is very seldom seen in perfection in our gardens, and yet it is one of the very easiest to grow, and one of the most useful. It can be used as a second-course vegetable, and also as a salad, boiled and sliced like Beetroot, while for flavouring soups it is almost, if not quite, equal to ordinary Celery; besides, it can be had in good condition when good Celery is not procurable. It is also very hardy; it takes a great amount of frost to injure it, and it is not so likely to suffer from insects and diseases as the ordinary Celery; indeed, I have observed Celery grown close to it quite ruined with a fungus similar to that which attacks the Hollyhock, and Celeriac was perfectly free from it.

To grow it well it should be sown thinly on a hotbed in the last week of March or first week of April. As soon as the seedlings are up the lights should be taken quite off on every favourable day, and, when large enough to handle, the plants should be pricked-out about 3 inches apart in equal parts of rotten dung and loamy soil. If it has a little warmth under it, it will do all the better. When it fairly is established in this, before the leaves touch, it should be planted in its permanent quarters.

The ground to receive it should be quite as liberally dressed as for the other Celery—that is to say, it should have 3 or 4 inches of good manure spread over the top and forked-in, keeping the ground level. Take the plants carefully up with a trowel; or cut into squares with a spade, and plant in rows 2 feet apart and 15 inches from plant to plant in the row. Very little attention will be necessary after this, unless the ground is light and the weather dry, when the plants may require water once or twice. They will be fit for use by the end of September, and may be taken up as required till there is danger of their commencing to grow a second time, when they should be taken up and kept in a similar way to Beetroot.

The treatment I give to this vegetable is exactly the same as that given to the main crop of Celery up to the final transplanting. The first week in April is the best time in the

whole year to sow for producing really good Celery, and not February or the beginning of March, as many would now have one believe. Sow late and thinly, prick-out as soon as large enough to get hold of, transplant finally with good balls before the leaves touch, and never allow it to receive a check. These are the only secrets in growing Celery or Celeriac.—W. TAYLOR.

### VARIETIES OF POTATO.

On reading his remarks on "Varieties of Potatoes" in last week's Journal, I have been greatly amused with the self-sufficiency of a contributor signing himself "A.," and I have no doubt the Royal Horticultural Society and *Irish Farmers' Gazette* will be equally so.

"A." professes to have great knowledge, and on the strength of this assumes at once the attitude of censor and of judge. What his qualifications are to either of these positions I do not know, but he betrays in his communication such an amount of ignorance on the subject upon which he writes, that I am led to think that his pretensions cannot be supported. To justify what I say, I ask you to refer to his communication. "A." asks, "What is Kentish Ashleaf?" He ought to have acquainted himself of this before he wrote and presumed to call in question the decision of the Committee who do know it. I will tell him. Kentish Ashleaf is that form of the Ashleaf which has been grown in Kent and by the great market gardeners round London for years before "A." was born, unless he is more than a century old, and is quite distinct in many respects from the old Ashleaf. It is a much stronger grower, and greatly more prolific than the old Ashleaf, which is easily distinguished by its dwarf growth, small leaf, and earlier maturity, on account of which it is preferred for forcing in frames. I find the true characters of the different Ashleaf varieties well described in the "Gardeners' Year-Book" for this year, to which I refer "A.," as he does not seem to know that there are three types, perfectly distinct, known by the name of Ashleaf.

In speaking of "Lapstones," "A." says that Yorkshire Hero was raised from the seed of that variety, and does not appear to know that Mr. Almond raised, or believes he raised, it from a graft-hybrid. So long as "A." confines himself to write on subjects he understands he writes well and instructively; but when he goes out of his way to run a tilt at such a body as the Committee of the Royal Horticultural Society, and sets up his limited means of observation against the infinitely greater advantages of the Society, he is doing himself an injustice, while he does the Committee no harm.

Does "A." know that, in making the attack upon the Committee of the Society, that he is setting his opinions against such men as Dr. Hogg, Mr. Barron, Mr. Fenn, Mr. Dancer, Mr. Douglas, Mr. Record, Mr. Earley, Mr. Woodbridge, Mr. Perkins, Mr. Beale, Mr. Barr, Mr. Nash, and a host of other practical men, whose sole object in these trials is to elucidate the truth from data which "A.," unless he has extraordinary opportunities, cannot possibly possess?—J. P.

### FLOWERS FOR OUR BORDERS.—No. 26.

#### MITRARIA COCCINEA.—SCARLET MITRARIA.

MITRARIA COCCINEA has the merit of being the only hardy plant of its order yet discovered. We do not, however, use the term "hardy" in its most extended sense; in very severe winters some protection would, doubtless, be necessary: but Messrs. Veitch, of Exeter, the importers of this fine plant, are of opinion that it would bear ten or twelve degrees of frost without injury.

The habit and general appearance of the *Mitraria* will be sufficiently understood by a reference to our figure. Its stems are unusually slender, branched, and, in specimens of sufficient age, reach the height of about 3 feet. The foliage is small, and somewhat brittle and succulent, with a number of short hairs scattered over its upper surface. The flowers are numerous, and produced singly from the axil of the leaves, on foot-stalks 2 inches long, with a ventricose corolla, from the mouth of which protrudes the long slender style. Its season of blooming extends from May to the end of June.

The soil most suitable for its cultivation is a mixture of good turfy peat and loam, in the proportion of three parts of the former to one of the latter. Where this is not at hand any soil containing a tolerably large proportion of leaf mould may be used, avoiding those of a poor sandy character, as well as pure loams deficient in decayed vegetable matter. When

grown out of doors it must be planted under a north wall, or screened from the sun's influence by a fence, for it will not flourish except in the shade. Until its hardiness in the northern and eastern counties has been more fully tested we would not recommend its exposure during the winter months without some protection. A small hand-glass or a large inverted flower pot will offer a ready means of warding-off the effects of frost; and to these may be joined, as an auxiliary, a small heap of coal ashes. Where there is the convenience of a cold frame, the roots may be potted in the autumn and preserved with less risk.

*Mitraria coccinea.*

If grown as a pot-plant it will be necessary to provide it with a cool, shady window; and an arid atmosphere must at all times be avoided. Especial attention must be paid to the drainage, for the soil in which it appears to succeed best being of a retentive nature, too great an excess of moisture must be guarded against by a good supply of broken crocks.

Gesneraceous plants, as well as all others with tuberous roots, usually require to be kept quite dry when at rest; but with the *Mitraria* a somewhat different treatment will be necessary, for its fibrous roots will not bear the complete withdrawal of moisture. It will, therefore, need an occasional watering during the winter months, though the soil must be kept only in a slightly moistened condition, and the plant should be placed in a cool situation—by no means in a warm apartment.

Its propagation presents no greater difficulties than that of the other plants of its order. The easiest mode of increasing it is by division of the roots in spring; but cuttings may also be taken at any time during the spring and summer months, and struck in any light vegetable soil under a bell-glass or tumbler.

It is a native of the Island of Chiloe, a circumstance which will explain both its comparative hardiness and its preference for a cool moist atmosphere and partial shade.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

### ALARUM THERMOMETERS.

WHEN in Edinburgh recently Mr. Bryson, philosophical instrument maker, Prince's Street, called my attention to a most ingenious arrangement of thermometers and galvanism, by which the temperature of the external air, or that of any glass

structure, can be indicated at any moderate distance, and it occurred to me at once that his invention could be made available in a great variety of ways for horticultural purposes: hence my reason for troubling you with a few suggestive remarks about his apparatus.

In explaining the mode of its action Mr. Bryson said, "Suppose you wish to be warned during the night when either the external air or that of any hothouse has fallen to a given point, you fix the indicator to that degree, and the moment it falls to it a bell fixed in your room begins to ring, and continues to do so till the temperature rises to about the given point again, unless it is thrown out of gear by yourself." This is what he calls the minimum indicator. There is also a maximum thermometer, which is set in the same way, so that the moment the heat exceeds that at which it is fixed the bell shall ring, this begins and keeps on till the temperature falls below the point fixed upon.

I need hardly suggest the variety of ways in which such an arrangement would be useful to gardeners, and more especially to amateurs, in the management of hothouses. For instance, when the weather is variable and sudden frosts set in, especially towards morning, the thermometer outside the window could be set to indicate 36°, and this would give a margin in order to get up heat before the freezing point was reached. In the case of amateurs who heat their small greenhouses with gas, they could have an arrangement in their bedrooms by which they could turn on more gas, and when the minimum point was exceeded the bell would cease, and they would know that all was safe. On the other hand, when the heat exceeded what was required, the damper could be dropped into the flue, or the gas shut off, as the case might be, by a simple arrangement like bell wires. In this way much trouble as well as fuel could be saved.—W. THOMSON, *Tweed Vineyard, Galashiels.*

### ROUGH PLATE GLASS.

THERE are, no doubt, those among our readers who are old enough to remember well nigh forty years ago. They will be able to call to remembrance some of what may be termed the curious incidents of gardening practice, as well as some of the many principles or theories promulgated during that time by those who regarded themselves as the legitimate teachers of the science of our profession. They will remember how ridiculously absurd were some of the schemes and systems which were expected to send horticulture bounding forward on the royal road of improvement. The Royal Horticultural Society of London had hollow pillars of brick built in its gardens, and filled with little besides bones and charcoal, in which to plant Vines and show practical men how to grow Grapes *ad libitum* in this unfavourable climate of ours. The next swing of the Vine-growing pendulum lauded as up to the nose in dead pigs and slaughter-house refuse as the prime powers for producing fine Grapes. By means of planting a single row of White Providence Pine Apple 4 feet apart in pits of rich soil heated with stable litter, some extra large fruit were produced, and hence an economical champion steps into the ring of gaping and wondering practical gardeners, and tells them that all that is needed to produce the finest Pine Apples are a few bricks, and boards, and glass lights, and some stable manure; and promulgates the theory, so complimentary to practical men, that whoever amongst them put their employers to the expense of hot-water pipes, &c., for Pine culture, could only do so with the pure motive of getting a per-centage out of the bill! Another wrote articles in the papers by the ell, to prove that the intermediate or progressive system of shifting pot plants was all wrong, and that the soundest and most sensible theory was to transfer them out of thumb pots into the largest size required at once.

Then rough and comparatively obscure plate glass was recommended as the panacea for all the ills to which plants are heir in ordinary glass houses. Among other wonders which this glass was to work, it was to render shade in bright summer weather entirely unnecessary, and yet it was not to intercept the light in winter! But we are not writing for the amusement of our readers, else we could well nigh fill our whole number with the absurdities which have been propounded. Of course, such advanced notions, when brought to the test of public utility, were found to be indebted to imagination for their rose-coloured virtue; and so such projects, and even their projectors, are speedily well nigh forgotten by an ungrateful generation of men who have the opportunity of practising the science of horticulture. But of course we must not forget

that there is a gracious law in nature that makes our own offspring appear to us the most lovely in the world, and unhappily all are not sceptical, and such theories are followed by a certain number, merely on the faith of high scientific authorities.

But our heading reminds us that it is a few words on our experience of rough obscure glass that we want to say. When the fact is stated that we are getting rid of it as fast as we can, it is scarcely necessary to say that we do not like it for horticultural purposes. We are not sufficiently clear-headed to understand how it manages to shade in summer, and in winter let through as much light to Pines, &c., as clear horticultural sheet-glass; but we have mastered the fact that it so shades them—both in summer and winter; that we find those grown under it are never so stocky, nor so certain to fruit when required, as those grown under clear sheet-glass.

Our experience with Vines under rough plate is that they require the most exact treatment in the matters of air-giving and air-moisture to prevent the under sides of the leaves from becoming one mass of blotchy warts; and even with such care we have never been able to wholly avert this affection—said by some to be produced by something amiss at the root, but which, we venture to say, is brought on in ninety-nine cases out of a hundred by overmuch moisture in the atmosphere and deficient ventilation in dull weather, and of course obscure glass favours the malady. And for Orchid culture we do not find it so good as ordinary ground sheet-glass.

We could find a much more extended catalogue of faults with rough obscure glass, but we do not consider it necessary in order to warn our readers, who may be building or glazing, against it, more particularly north of the Tweed, where gardeners are not troubled with overmuch light, as a general rule.

Rough plate is recommended for horticultural purposes chiefly because scalding sometimes occurs to Vines and Pines under clear sheet-glass when the sun is powerful in our few bright months. Where such is the case, and the evil cannot be obviated otherwise than by slight shadings, we should recommend shading for a few weeks in preference to glazing with glass sufficiently obscure to keep light from the plants for three-fourths of the year. We have never experienced scalding under the clearest sheet when it is, as it ought to be, free from specks. Foreign sheet-glass is generally very specky, and all such glass should be rejected; and where a few specks do occur, they are easily obscured in summer, so as to prevent their acting on the foliage like lenses.

Unless it be in exceptional circumstances, and during the very brightest sun, we consider shading to healthy Pines and Vines, as well as many other things, a great evil. To increase the evil by using glass which prevents the fullest passage of light (for the sake of preventing any bad effects that may arise from its intensity for a very short time of the year, while such can be temporarily effected), cannot be sound practice. Light is the great consolidator and colonist of our flowers and fruits; besides, flowers and fruits may be called for in vain, like spirits from the vasty deep, unless vegetation is first perfectly matured by the agency of light.—(*The Gardener.*)

### GARDENING VICTIMISED BY SMOKE.

"Each day the wind rising with sooted wings,  
A sable cloud athwart the welkin flings."

I READ with great interest your articles on "Villa or Suburban Gardening," and try to glean what information I can from them; but, unfortunately, they fall short of what I require, for I have the misfortune—and it is a misfortune to all who love flowers—to live near a large manufacturing town, and my efforts to render my beds gay and flourishing are entirely frustrated by the volumes of smoke that pour over them from the tall chimneys in the neighbourhood. This evil is not touched upon by the writer of the articles in question, and I, for one, should esteem it a great boon if he, or any of your readers, would occasionally give the names of a few plants hardy enough to resist this abominable nuisance. Some flowers I find will thrive in spite of it, but very few. That lovely flower *Phlox Drummondii* does well, and a few more common annuals, such as *Clarkia*, *Eschscholtzia*, *Convolvulus minor*, but not major, *Marigolds*, *Mignonette*, *Asters*, *Stocks*, &c.; but these last only a short time, and I try in vain to make anything of *Scarlet Geraniums* or *Verbenas*. The same with *Roses*, except a few, and those do only moderately well. *Pinks* and *Carnations* I can grow, and for this I am thankful; but as I have a large garden just in front of the drawing-room

window, I am most anxious for a few hints as to any addition it would be possible to make under these unfortunate circumstances. I may add that the garden is on a hill, and much exposed to the west and south-west. The kitchen garden presents the same difficulties, and although I have sown Peas over and over again they never pay for the trouble. I have a good wall fronting the west, and on this I have occasionally a few Pears. Cherries I can make nothing of, except a small crop of Morellos on a south wall; the same with Apples and Plums, although we have many trees.—A LADY GARDENER.

[Many besides our correspondent would be benefited by such information as she seeks for, and we will readily give insertion to communications on the subject.—Eds.]

### THE VALUE OF FUEL.—No. 2.

It was shown in the last paper on this subject that the theoretical amount of heat yielded by different species of fuel was enormously modified in practice by the nature of the arrangements for combustion and for the utilisation of the heat. It is quite possible, in consequence, that the cheapest of fuels might become the dearest in use. Still, before considering the best mode of extracting the heat, it will be as well to ascertain which species of fuel is really the most economical at existing prices, supposing its full degree of heat could be employed. The prices will of course vary according to localities, but each person may correct the figures for himself.

Taking coal at 20s. per ton, the price per pound is about one-ninth of a penny. A ton of coal yields from 55 to 80 per cent. of coke—according to its quality—or say on an average fifteen hundredweight, which is about the weight of a chaldron of thirty-six bushels. It may be convenient to remember that as coke swells in making and thus occupies more bulk than the coal from which it is made, its weight is somewhere about half that of the same bulk of coal. The price also varies, but generally it is about 30s. per ton, or say one-sixth of a penny per pound. Of gas about 9500 cubic feet are made from each ton of coals—it is of specific gravity from .50 to .55 (air being 1.0, and 13½ cubic feet of air weighing 1 lb.), and this quantity of gas therefore weighs about 365 lbs. At 4s. per 1000 cubic feet, as furnished by the companies, its cost is therefore about 1½d. per pound. Petroleum at 2s. per gallon costs about 3d. per pound, and colza oil 6d. per pound.

If, therefore, we range these substances according to the cost of the quantity of each required to yield 10,000 units of heat we shall obtain the following results in pence and decimals of a penny:—

Colza .....	33	Coke .....	15
Petroleum .....	15	Coal (Household) .....	08
Gas .....	5		

Or, in other words, a given amount of heat which can be obtained from coal of ordinary quality for 1d. would cost nearly 2d. if derived from coke, 6d. if derived from gas, 1s. 6d. if derived from petroleum, and 3s. if derived from colza oil.

Obviously, then, coal is the fuel which economy points to, provided only we can burn it economically. The fact that other descriptions of fuel ever compete with it only shows the points in which we mismanage it. Coke yields no waste in the form of smoke, and gas no waste in the form of unconsumed carbonic oxide, while the oils, if used, are generally employed in lamps, or in an apparatus which extracts the whole of their available heat. Thus dealt with they may easily become more economical than coal, thrown in masses into a furnace which vomits forth unburnt gas and soot, and which is placed beneath a boiler so small as to let nine-tenths of the heat escape into the chimney. But these errors may be remedied. A wide and long range of furnace bars on which the fire may be kept thin and bright, and the coal gradually coked as it is pushed forward from the front, while air enough is admitted to consume fully the hot gases at the back, the admixture of clay balls to prevent caking and to make combustion slower while equally perfect, and a large increase of boiler-surface exposed to the flame and effluent gases, aided, if necessary, by the addition of a flue through which they may give off their heat in the house before entering the chimney, would enable us to use coal with the certainty of giving the full advantage which its real heating power and low price can afford.

But it must be kept in view that to permit this result space is absolutely essential. It is true, indeed, that whatever the fuel a large boiler-surface is alike indispensable, for iron can

only transmit a fixed amount of the heat applied to it in a given time, and if we want more heat we must increase the extent of iron exposed. But, over and above this, coal needs space for its combustion, for its nature is such that in a confined space it distils instead of burning. Now a large space is not always to be had, and in such cases either coke or gas may prove more convenient. But I may point out that in burning coal another element of great value is wasted, and might be preserved without loss of heat. Your readers are all aware that in gasworks a large amount of ammoniacal liquor is produced, the value of which as manure is immense. Each ton of coal (if of average composition) yields thus about 30 lbs. of ammonia, the money value of which at present prices is about 25s. I have shown in a recent number of the *Agricultural Gazette* of what enormous importance to the country it would be to save this waste, and I have also suggested that the general use of private gasworks would be a measure which would do something in this direction. Attached to gardens such apparatus would cost little trouble, and indeed in many establishments they already exist. But the resulting gas need not be purified when intended only for heating purposes (although it might be if desired also for lighting), since it would be equally available for heating although not thoroughly purified. In ordinary gasworks about one-third or one-fourth of the coke produced is used for heating the retorts in which the gas is made, but in gardens a large proportion of the heat thus expended could be recovered, either by the use of a flue, or of a boiler to utilise the heat from the furnace in which the retort is heated. The practical result would be that each ton of coal would yield about half a ton of coke for combustion in the regular stokeholes (over and above the coke employed in the retort furnace), about 9000 cubic feet or 350 lbs. of gas for use in heating whenever found convenient, and at least 20s. worth of ammoniacal liquor for application to the garden crops.

In future papers I shall deal with the arrangements for conveying the heat to the places where it is required, and the amount of heating surfaces necessary for given amounts of cooling surfaces.—J. BOYD KINNAR.

### RAINFALL AT NASEBY WOOLLEYS, NORTHAMPTONSHIRE.

### NASH COURT.

I HAVE only lately seen an interesting communication on Nash Court in Kent, from Mr. J. Robson, in the number of THE JOURNAL OF HORTICULTURE for October 9, 1873. As the great grandson of the last Thomas Hawkins, of Nash Court, and a party to the sale of this old family place to Mr. Lade, the present owner, I send you a correction which you may like to notice. There are in Kent two estates, both of which bear the name of Nash Court—one in the Isle of Thanet and the other near Boughton-under-Blean, Faversham; and these have been inadvertently confounded in the history of Mr. Lade's house. The descent, I believe, is correctly stated through various families down to the Turners, of the Nash Court in Thanet, which, as long ago as when Hasted wrote his history of Kent (1790), had ceased to be a gentleman's mansion, and was used as a farmhouse and granary. But the error is in applying that descent to Nash Court at Boughton. That estate never passed away (for more than five hundred years) from the Hawkins family. It came to them by the marriage of Joan de Nash with Andrew Hawkins, as appears by the inquisition *post mortem* taken 17 Edward III. (1343). It descended from

father to son until it came to the Thomas Hawkins mentioned by Mr. Robson, who rebuilt the mansion, and who died June 21, 1766, at the great age of ninety-two. He was the grandfather of the last Thomas Hawkins, of Nash Court, who died September 23, 1800, leaving four daughters and co-heirs—

1. Bridget, married to Henry Roper, 14th Baron Teynham.
2. Mary, married to Sir Edward Knatchbull, Bart, of Mer-sham Hatch, Kent.
3. Anne, married to Lt.-Colonel Woodroffe, of Poyle Park, in Surrey.
4. Eleanor, married to Henry Gould, brother of Sir George Gould, Bart, of Old Court, Co. Cork, whose descendants in 1864 sold the estate to Mr. Lade.—G. F. DUNCOMBE.

## PORTRAITS OF PLANTS, FLOWERS, AND FRUITS.

**FRAGREA ZEYLANICA.** *Nat. ord., Loganiaceæ. Linn.,* Pent-andria Monogynia.—Flowers white. "A native of the central province of Ceylon, where, according to Dr. Thwaites, it abounds on the banks of the river at Balangodde. It is one of the handsomest species of a fine tropical Asiatic and Poly-nesian genus, of which some twenty species are enumerated by Bentham in his notes on Loganiaceæ, published in the 'Linnæan Journal' in 1857, to which several more are now to be added from the Malayan Islands."—(*Bot. Mag.* t. 6080.)

**GAILLARDIA AMBLYODON.** *Nat. ord., Composite. Linn.,* Syn-genesia Frustranea.—Flowers crimson. "A very handsome October-flowering annual, a native of sandy plains in Texas and New Mexico, where it blossoms from the beginning of summer until the winter's frost cuts it off. The genus to which it belongs inhabits both temperate North America and extra-tropical South America, and consists of about eight species. The present species was discovered by Berlandier in 1827, and collected subsequently by Lindheimer in 1844, and by Drummond in 1845."—(*Ibid.*, t. 6081.)

**STAPELIA CORDEROYI.** *Nat. ord., Asclepiadaceæ. Linn.,* Pentandria Digynia.—Native of South Africa. Flowers green and purple-tipped. Dr. Hooker says, "I have named this very curious and distinct species after Mr. Justus Corderoy, of Blewberry, near Dideot, an old and an eminent cultivator of succulent plants, and for many years a valued correspondent of the Royal Gardens. It flowered at Blewberry in September of last year."—(*Ibid.*, t. 6082.)

**IRIS DOUGLASIANA.** *Nat. ord., Iridaceæ. Linn.,* Triandria Monogynia.—Flower lilac and white with purple veins. "Dis-covered by Coulter in California, and subsequently collected by David Douglas in 1833 in New California, but unknown to me from any other locality and collector, except from a men-tion of the plant in one of the reports of the United States' surveys, where it is stated to be found on hillsides in the Grass Valley, California, together with a large-flowered variety (how large it is not said), and longer pedicels (1 inch) at the Corte Madera, also in California."—(*Ibid.*, t. 6083.)

**OBONTOGLOSSUM ROSEUM.** *Nat. ord., Orchidaceæ. Linn.,* Gynandria Mouandria.—"In its rose-coloured flowers this forms a remarkable contrast to the prevalent colour of the genus to which it belongs. It was discovered by Hartweg near Loxa, in the Peruvian Andes, in a quite cool region, and was introduced by Mr. Linden from that region by his able col-lector, Mr. Wallis, in 1865."—(*Ibid.*, t. 6084.)

**STRAWBERRY—The Amateur.**—"We have to thank Mr. Barron, of the Royal Horticultural Society's Garden, Chiswick, for the examples of this fine and useful Strawberry. It is another of the triumphs of Mr. Bradley, whom we have had to thank already for Oscar, Dr. Hogg, and others of our finest fruits, amongst which this last is not by any means the least. During the past season abundant evidence has been adduced to prove it one of the most useful of its class. It has been named Amateur by Mr. Bradley, in consideration of its enormous cropping qualities, its free growth, and general suitability for amateur cultivators. The appearance of the plant is some-what like that called Sir C. Napier, a stronger grower, how-ever, better constituted, and with the leaves larger and of a deeper green, but somewhat subject to mildew. It is a very heavy cropper; and the fruits, which keep well, are very large, obovate, and cockscombed in shape, of a fine deep red colour, frequently with a heavy coating of glaucous bloom, like the Hauthois. The seeds are small and prominent. The flesh is firm and solid, of a deep red colour, and of a fine, rich, sparkling, sub-acid flavour, exceedingly pleasant to the palate. It is in all respects a very excellent Strawberry, and well

worthy of the first-class certificate awarded to it by the Royal Horticultural Society. In reference to this Strawberry we have received the following communication from Mr. Earley:—"The new seedling Strawberry named The Amateur has proved here to be a most valuable addition to existing varieties. Black Prince, President (of two separate growers), Dr. Hogg, Keens' Seedling, and British Queen—which does well on this ground—all ripened in the order here noted, and they were followed at the nick of time by Amateur, which well filled-up the gap existing between the last named of the older kinds and the valuable Frogmore Late Pine. The fruit of The Amateur is firm, and good for travelling. It grows close around its crown, requiring a less amount than usual of net-protection, and possesses a flavour more brisk and refreshing than Strawberries generally have, and this without anything approaching to unpleasant acidity. Indeed, to those who think Strawberries somewhat insipid, The Amateur will prove a boon. Small runner-crowns dibbled out on to good soil somewhat late in the season, were able to produce a crop."—(*Florist and Pomologist*, 3 s., vii., 25.)

## POINCIANA REGIA.

THERE are two well-marked varieties of this magnificent flowering tree in the East Indies, though I cannot say whether they are permanent or not. One has scarlet and yellow blossoms, and the other crimson and white. The former seems to be the most common, and is abundant at Madras, Secunder-abad, Rangoon, and other places, while the latter prevails chiefly at Bangalore. Whether due to the climate or not I am unable to state, but it appeared to me that the foliage of the Bangalore plants was richer and more profuse, and consequently much more beautiful, than any that I saw elsewhere. Indeed, the luxuriance of the trees generally on the Mysore plateau seemed to indicate that there they had found conditions of soil and climate eminently favourable to their most perfect development. There are, however, many large and noble spec-imens at Coimbatore, near the foot of the Neilgherries; and in May, 1866, the road close to the town was all aflame with their gorgeous flowers. No object in the whole vegetable king-dom can, in my opinion, vie with this splendid Poinciana in the radiant wealth of its peerless bloom—not even the far-famed and glorious *Amherstia nobilis*, which I have seen in great perfection at Rangoon and Moumein, in Burmah.

I have now and then heard the Poinciana regia called the Ostrich-feather Tree, without doubt on account of its beautiful foliage, which has much the appearance of broad spreading plumes; and at Bangalore it is occasionally known as the Flame of the Forest; but this name, though by no means in-appropriate, is the prior property of another brilliant plant, the *Ixora coccinea*, to which it is also very applicable. Some-times in India the term Gold-Mohur Tree is used to specify the Poinciana under notice, though it seems to be really owned by the yellow species *Poinciana elata*; and the name of Flam-boyant is familiar to those who have seen the tree at the Mauritius.

Poinciana regia has apparently only been found in a wild state in Madagascar, whence it made its way many years ago to the Mauritius, and subsequently further east. It belongs to the Natural Order Leguminosæ, and the genus was named by De Candolle in honour of M. de Poinci, once governor of the Antilles.—G. E. L.

## CHATSWORTH.

THE SEAT OF THE DUKE OF DEVONSHIRE.—No. 2.

THE other most remarkable feature of Chatsworth is to my mind, as I have already said, the Victoria regia house. There may be, for all I know, other houses for aquatics as large as this, but I am sure that none can ever equal it in interest. No one standing within it can forget that it is the little germ from whence arose the gigantic glass house of 1851 and the Crystal Palace at Sydenham; but whether or no there are others larger, there are none more attractive. We have not only the queen of Water Lilies in excellent condition and in full flower; but round the house are different varieties of Nelumbium and Nymphaea, while Palms with their graceful and elegant foliage placed at the edge of the tank add their charm to the scene. Suspended, too, from the roofs are large baskets of Achimenes, some radiant with their brilliant blue flowers, and others like a sheet of snow; and thus again artis-tic beauty and horticultural skill go hand-in-hand.

I think few persons understand what are the requirements of such a place as Chatsworth, and the amount of responsibility that rests on the gardener who has to supply the wants of its owners. How few who, admiring the luscious fruits or brilliant flowers which adorn the tables of our great houses, think of how much the skill and intelligence of one man have been taxed to send them in just at the time that they are wanted. If they want to have an idea of it, then let them go through the long lines of houses contained in this garden—look, too, at the out-door arrangements, and then say whether he who has all this on his shoulders has not his work cut out for him. Such were my own reflections on going through house after house in the kitchen garden. Here, for instance, are two houses entirely filled with pot Vines. Here, again, are houses after houses filled with Black Hamburgs, Muscats, and all

the best kinds of Grapes, among them Mrs. Pince being noticeable and much used by Mr. Speed. The late houses, containing Black Alicante and Lady Downe's, were in fine condition. Then we came upon Peach and Nectarine houses, from whence the fruit had all been picked, but the trees with their well-ripened wood promised well for another year. Then we have a Fig house 50 feet long, all the trees being in pots; then a splendid house of Plums, and so on in every department of fruit-growing. Then as to flowers and plants, the same *embarras des richesses* meets one at every turn. Here, for example, is a circular house erected for *Amherstia nobilis*, that grand and noble paragon of India; while all round the front are fine specimens of *Nepenthes*, which have been planted out and trained to the glass. Here is *N. Rafflesiana* with its dark green pitchers, and *N. sanguinea* with blood-red-coloured ones.

CHATSWORTH.

Here, again, *hybrida maculata* with pitchers streaked with reddish purple, and others of this strange family.

Turn we now to the three Orchid houses with such plants of *Vanda* as are rarely seen, *Aërides*, *Saccolabiums*, *Phalenopsis*, &c. Another house contains *Cypripediums*, *Miltonias*, then another *Dendrobiums*, *Cattleyas*, *Laelias*, &c.; while trained along the house is *Stephanotis floribunda*. And now we come upon a fine collection of *Sarracenias*; then to a stove filled with fine-foliaged plants for decoration—*Crotons*, *Dracenas*, *Marantas*, and allied plants; plenty, too, of *Palms*, which, in their young state especially, are so useful for this purpose. But as I have said, what description can ever give one a correct notion of the grandeur of such a place? It is, however, well to recollect that an intelligent gardener like Mr. Speed is not contented with dealing with grand totals; he is also conversant with smaller details. Here are two instances: We all know *Disa grandiflora* is a difficult plant to grow well. I found here, however, a fine specimen, but Mr. Speed told me there was only one position in the house that suited it. He had tried it in others, and it immediately began to droop. This was near to the door in an intermediate house; here it received the full air, and seemed to rejoice in it. The other instance was *Ouvirandra fenestralis*, the curious Madagascar Lattice Plant. Although often grown, how seldom is it grown well! and since I saw a fine plant of it some years ago at Dangstein I have

not seen so good a one as here. Now Mr. Speed has ascertained three things with regard to it—first, that the tank should be placed close to the north wall of the house; second, that the plant should be potted deep; and third, that it should be sprinkled every day. Under these conditions it thrives wonderfully well. One of the most attractive places in the grounds was a long glass corridor, on the back wall of which were trained many fine climbing plants, such as *Indigofera decora* with pretty lilac-coloured flowers, *Clematis Jackmanni*, *Rose Maréchal Niel*, *Lapageria rosea*, *Rhynchospermum jasminoides*, *Cantua dependens*; and here also was a fine plant of the old *Fuchsia microphylla*, so seldom seen, and so very pretty. In the centre is a grand plant of *Camellia reticulata*, and another fine one of *Alba plena*. Adjoining the house stands the orangery, which on grand occasions is lighted up and forms a beautiful object. It is 100 feet in length, and filled with Orange trees 15 to 20 feet high, *Camellias*, tree Ferns, &c.

As the Victoria house was the model from whence arose the Crystal Palace, so doubtless the waterworks at Chatsworth suggested the grand display at Sydenham. Far up in the woods when the water is turned on, as it obligingly was by Mr. Speed when I was there, one sees it tumbling down a veritable cascade; as it comes further down it is made to go

over a temple, which thus becomes a veritable water temple; then it rushes down a long and steep incline of stone steps, forming where it pours down it a swift and noisy rapid, and finally the *chef d'œuvre* of the grand fountain, throwing its jet far above the highest trees with which it is surrounded—a noble series of works, fit for such a residence.

It would be useless for me to proceed further. In every department—flower, vegetable, and fruit—I saw evidence of the highest skill and the use of almost unlimited wealth; and I can well understand the pride which such a gardener as Mr. Speed can take in the garden. Such a situation, however, has its drawbacks. Chatsworth is a show place, and this involves a constant succession of visitors, many of whom, caring not a doit for horticulture, think they must do the garden as well as the rest of the place; and many times, if they are people of position, must be accompanied by the head gardener. Now I do not believe any gardener grudges this when the visitors really care about a garden, but when they do not it is an insufferable nuisance. I hardly suppose that there are many railers at a "bloated aristocracy" amongst the readers of the Journal; if there are, it may be as well to mention that to allow the public to have the liberty they possess of going through the grounds and garden involves an expenditure of £2000 a-year.

Such were my impressions, faintly described, of Chatsworth. We see grand châteaux abound, large forests, and picturesque grounds, but nowhere can one find such gardens as are attached to many of the grand mansions so liberally dotted over our tight little island.—D., *Deal*.

### AVOIDING POTATO FAILURES.

It may probably be considered incorrect to assert that degeneration of the tubers of the Potato has not occurred, when the fact of its being subject to disease would imply degeneracy. There can be no doubt that the system of the modern Potato, under the influence of cultivation, has become far more susceptible than the plant was when first introduced from its native habitat, and it is for this reason that I consider careful selection and culture to be most advisable—not to cure the disease, but to combat and avoid its evils so far as may be.

Excessive moisture has all along been recognised as the primary cause of disease; and I believe I am correct in stating that the disease was not unknown to many persons before the ungenial season of 1845 brought it down in one fell swoop upon the entire crop throughout the country. But there is another evil that is much to be dreaded, arising from the effects of excessive moisture, and called supertuberation or second growth; for, while the blight may spoil part of a crop, supertuberation in its worst form will affect the whole so seriously as to render it totally unfit for table. Happily the cause of this second growth is no mystery. The hot dry weather of July frequently induces in the general Potato crop premature ripeness; when this occurs the growth of the tubers ceases and nothing will induce them to swell to a larger size. The rain that so frequently follows in August then causes supertuberation, accompanied by the growth of laterals upon the haulm. What can be done, then, to avoid such a combination of evils which at first sight appears likely to render all our care unavailing? We must be constantly on our guard in July, especially towards the end of the month; and if the foliage assumes a yellow tinge, however slight it may be, it is a sure token that growth—the legitimate growth of the season—has ceased, and that the crop is sufficiently ripe to be taken up. This is the grand opportunity, and those who are fully awake to its importance will not dally but lift and house the crop as quickly and carefully as possible. Then, when the early autumnal rain sets in, we gladly welcome it, rejoicing in the refreshing verdure of the pastures that have been parched by the summer sun, and in the quickened growth of Turnips, Celery, and other important crops, instead of complaining of the weather with our hands in our pockets, or writing melancholy accounts of the ravages of the blight, and the sad prospect before us when we shall have begun searching for the remains of the crop in September or October.

The fact of the antiquated notion that a crop of Potatoes will be spoiled if taken up before the haulm is either dead or very much decayed being still very prevalent, affords another remarkable example of the difficulty of impressing the agricultural mind with the necessity for improvement or advance. The beaten tracks and landmarks of our forefathers should be to us as a starting-point, whereon to base improvement, rather

than a dead weight to cripple our efforts and retard our progress. Let but the fact be clearly recognised and acted upon, that the only Potatoes worthy of cultivation for the general crop are those which may be lifted quickly after the tubers cease to swell, without suffering any deterioration of quality, and that we are really in possession of such kinds, and future losses from either blight or second growth will be so much reduced as to be comparatively trifling.—EDWARD LUCKHURST.

### NOTES FROM MY GARDEN, 1873.—No. 3.

THE earliest florists' flower with which I have to do is the Hyacinth; and as I had a good bloom last year, and was enabled to take the first prize in the only class I could exhibit in at South Kensington, I may be helping others, perhaps, if I detail my plans, inasmuch as I am obliged to combine economy with efficiency, and, having no forcing house, it is not an easy matter to get in good blooms by the time of the Show, March 18th.

It is usual, in giving directions for growing plants, to begin with the soil, but in the case of the Hyacinth there is something antecedent to that, and that is the bulb itself. No amount of care, skill, or expense will avail if you start with indifferent bulbs. If you wait until the season is advanced, and bulbs have been tossed about in shop windows, and have already exhausted some of their strength, it is hopeless to get a good spike; therefore it is well to be early in the field, and select, or have selected for you, good bulbs in due time. Size does not always indicate a good bulb; many bulbs never are large. A good weighty one, sound at the base, is what ought to be sought for, but the better way is, I believe, to leave it to the seller; tell him what bulbs you want, and for what purpose, and you will not be disappointed.

I grow generally about eighty bulbs, and the following were the chief sorts that I grew last year. It will be observed that they were nearly all single flowers, as these are the best for exhibition, giving larger and fuller spikes. I have marked with an asterisk (\*) those which gave me the finest trusses.

Of double varieties I grew

Duke of Wellington * Noble par Merite Blokberg Koh-i-noor	Laurens Koeter Grootvorst * Prince of Waterloo Garrick
SINGLE REDS.	
Cosmos * Norma Princess Helena La Dame du Lac	Le Prophète Howard * Lord Macaulay * Cavaignac
SINGLE BLUES.	
Couronne de Cella * Grande Vedette Charles Dickens La Nuit	* Grand Lilas * Argus * Lord Palmerston Prince Albert
SINGLE LILAC OR MAUVE.	
Haydn	Unique
Grand Vainqueur * Mont Blanc * Grandour a Merveille Elfrida	PURE WHITE. Grande Vedette * Paix de l'Europe Orondatee Alba maxima
Alida Jacoba * Duc de Malakoff	SINGLE YELLOW. Anna Carolina * Ida
Robert Steiger * Mrs. Beecher Stowe * Solfaterre Von Schiller	
Grand Vainqueur * Baron Von Tuyl Mimosa Orondatee	
* Madame Van der Hoop Queen of the Netherlands * Mirandoline	
Koning van Holland * Heroïne	

In this selection I believe that most of our finest flowers will be found, and on looking through the list of winning flowers as shown by larger exhibitors I find that they are generally composed of such kinds. Now and then a few newer varieties are to be found, but it is not often that the new surpass the older sorts.

And now as to the method of culture adopted. At the end of October I made up a compost of half old rotten cow dung and half loam taken from the top spit of a meadow, and added a good portion of sand so as to keep it open. The pots used were 32's, one or two large pieces of broken pots placed at the bottom, and then the pot filled up with the compost; a hole was then made at the top of the mould large enough to place the bulb in, and a little sand put in it, and the bulb then planted. I have found this better than making the hole with the bulb itself, for they then sometimes push themselves out if any resistance is offered to the tender rootlets. I next placed a small pot reversed over the bulb, and on the hole of it put a piece of tile; the pots were then all placed together in a shady place, covered over with about a foot of leaves, and there left. This was for the purpose of promoting root-action before

the bulbs pushed. Ashes, or sand, or any material that will keep them dark will answer; but leaves were convenient to me, and, moreover, are light and easily managed. They were taken out of this about the end of December and transferred to a cool vinery, where, however, they were kept from frost. As I had not any forcing house I was compelled to adopt what is, I believe, a Dutch plan. I made up a small hotbed and placed the pots in it: they rapidly came on. I then transferred them to the top shelf of my greenhouse, giving them a plentiful supply of water all the time, and also giving them occasionally liquid manure. I have a small house in which I bloom my Auriculas, and to this all except those I took up to South Kensington were consigned, and I had a very beautiful bloom. Of course they were staked as they grew, so as to prevent the blooms from falling about. Those that I took to the Royal Horticultural Society won the first prize; so that I am justified, I think, in saying that in my little way I did very well. Those who do not wish to get them in flower so early need not trouble about the hotbed, but will have a good bloom at the end of March.—D., Deal.

### ORNAMENTAL BRICK.

THERE is a form of brick used here in constructing ornamental screenwork on the upper portion of walls which I think is worth bringing before the notice of your readers. It is capable of

Fig. 1.

making various effects according as the bricks are combined. In the sketch I send you (*fig. 1*), the bottom layer is made by the bricks being laid horizontally, and the next tier perpendicularly, but another effect can be produced by placing all the bricks perpendicularly, while still another may be obtained by placing them all horizontally. In each case the effect produced is very good, and the frequency with which it is met with about Mentone testifies to the partiality the people have for it. The brick (see *fig. 2*) is 8 inches long,  $5\frac{1}{2}$  inches broad at the widest part, and  $2\frac{1}{2}$  inches in the middle. It may, I think, be advantageously introduced into this country, and made in ordinary brick earth or in terra cotta.—R., Mentone.

Fig. 2.

### NOTES ON VILLA AND SUBURBAN GARDENING.

**CUCUMBERS.**—As some may have dung sufficiently fermented to be made into a bed for the growth of these, I will offer a few remarks on the most simple method of management. Presuming we have a common frame, the first thing will be to excavate the ground where the bed is to be formed to the depth of 3 or 4 feet wider and longer than the frame to be used. In the centre place a layer of faggots or waste wood, 2 feet thick, of the size of the frame, and upon this foundation lay the fermented dung, taking care to make the mass firm as you proceed until the bed is 4 feet high in front and  $4\frac{1}{2}$  feet at the back. If the dung is not well fermented or dry it will be advisable to sprinkle it with tepid water as you proceed. The bed being formed, the frame must be placed upon it; and as soon as the mass begins to heat, the dung inside the frame should be forked over twice or thrice a week until it is quite sweet—that is, until the steam evolved is inoffensive to the smell. At that time the frame must be lifted off, and the dung from the centre of the bed formed 6 or 8 inches wide all round the sides. On this wall place some boards 6 inches wide, so that their outer edges will be even with the outside of the frame, and then plaster the inside all round with mortar or tempered clay, which will prevent the entrance of steam and keep the woodlice out of a favourite retreat. Should the dung be very hot some strong pieces of wood may be placed across the bed, with some boards,

and then turf above them, on which the soil for the plants must be put. A hot-air chamber is thus formed between the dung and the soil, by which every part of the latter is at all times equally heated, and all risk of burning the roots is removed. The heat from this chamber may also be brought in to warm the atmosphere of the frame in a case of emergency.

It is of little importance what kind of soil is used so long as it is not of an adhesive nature. Peat earth is good because it is porous, and its poorness is remedied on dung beds by the carbonic acid and ammoniacal gas from the fermented dung which pass through and enrich it; but I have found sandy turf loam and leaf mould in about equal quantities used in a rough state superior to it. The soil should be placed in a narrow ridge along the back of the frame, not so as to rest against the woodwork; in this position it gets rather more sun, and the young plants have the advantage of the light reflected from the back of the frame.

In planting, place two plants under each sash, and within 8 inches of the glass; pinch the top from one of them as soon as it has made three rough leaves; train the laterals along the back of the frame, and stop them above every leaf until they show fruit. These plants will produce a few early fruit; but the others, which are to be trained towards the front, must not be allowed to bear fruit until they have acquired strength, as they must be depended upon for the main supply.

It is not necessary that the temperature of the frame should exceed  $65^{\circ}$  with air by night; but by day, with sun and air, it should range from  $70^{\circ}$  to  $85^{\circ}$  or  $90^{\circ}$ . Sprinkle the plants in the afternoon, about two o'clock, of every sunny day with tepid water, and shut the sashes close down, but give a little air at the time the frame is covered up for the night. Unless the weather is very bright, water at the root will not be required more than once a week until the middle of March, but after that time the plants will stand in need of it more frequently. Keep the temperature steady at  $65^{\circ}$  by occasionally turning and renewing the linings. Do not allow the bed to become crowded with useless vines. Keep the glass clean, and success is certain.

If severe weather continues every available means must be adopted to protect Tulips, Auriculas, &c. We would, however, be perfectly understood that we do not advise smothering them. Air must be given to all plants in frames whenever opportunity occurs. Should the sun shine brightly after a severe frost keep the mats and coverings on, at the same time tilting the lights. It will be requisite to put small quantities of fresh bran under tiles in Auricula frames, the tiles being raised from the ground at the corners by small pebbles. On them the pots may be placed, so that no room may be lost by these most effective slug-traps. As prevention is better than cure we would advise amateurs to clear their frames of such vermin by this simple plan. At this season mice are very apt to be very mischievous among Polyanthes when kept in frames, by eating the hearts of the plants. When the weather is sufficiently fine lose no time in planting Ranunculuses. These beautiful flowers delight in a cool subsoil. It will soon be time to put Carnations and Picotees in their blooming-pots. If a proper quantity of compost is not prepared lose no time in mixing it, at the same time keeping a vigilant look-out for all injurious insects, &c. Do not let a frosty day pass without giving it a turn-over, the trouble will be amply repaid by the excellent state of the soil.

The Chinese are very attentive to the house culture of many of the orchidaceous epiphytes, and thereby greatly increase the beauty and the fragrance of their apartments; they have them in ornamental vases and baskets, and even suspended in the air, where they last for many years and flower beautifully. Some of them continue in flower for many months, and diffuse the most delightful fragrance during the night. *Renanthera coccinea* is one of the finest of these.

The reason why the succulent and epiphytal plants answer so well for house culture is that their winter is one of drought and not of cold, and that the latter especially have little, and some of them no soil at the roots in their natural situations. But there has been hitherto a prejudice against, or at all events an ignorance of, and want of attention to the culture of succulent plants in this country. This is unwise, for many of them are exceedingly beautiful, highly fragrant, and better adapted for house culture than any plants whatever. They are singularly curious and varied in their structure, and generally speaking they require less light, air, and moisture than other plants.—W. KEANE.

### ECONOMY IN THE ARRANGEMENTS OF CUT FLOWERS.

A FEW words on this subject may not be altogether uninteresting to the readers of the "Gardener" at this season, when flowers are generally rather scarce. Like many more of my brother gardeners, I have often to study how to make the most of what I can gather together of all sorts. I have found a great saving of flowers by making hand-bouquets on light

wire frames, which I shall endeavour to describe, in hopes that it may benefit some one similarly placed with myself. These frames are very simple, easily and quickly made; for I feel as if I could make one quicker than describe how it is done. In the first place, make a hoop of any sort of thin, stiffish wire (I use small galvanised wire), about 4 or 5 inches in diameter. This done, get three pieces of the same sort of wire about 8 inches long, and with the pliers twist each into the shape of the accompanying figure. Make the length from *a* to *b* equal to half the diameter of your hoop. Now, by means of the little hooks at *a*, arrange the three pieces of wire at equal distances round the hoop, and press the hooks tight with the pliers, and it will be found that the three legs *c* will all meet at the centre of your hoop; and by tying those together with a piece of fine copper wire they form the handle of the frame. Before tying these together I generally add a fourth wire to stand straight up in the centre, about 1½ or 2 inches above the level of the hoop: this serves to keep the centre-piece of the bouquet in its proper place. Next, get a piece of common galvanised wire netting of a smallish mesh, and cut out a round piece of the size of the hoop of the frame; place it on the top of it, and fix in any convenient manner on the hoop or the three cross wires, keeping it slightly depressed in the centre, and the frame is complete.

Scarcity of flowers was not the first thing which made me think of this plan. The ladies for whom I am in the way of making bouquets for balls, &c., complained of my making them too "dumpy," and also too small. I could certainly remedy the latter complaint; but I found that the larger I made them they became the more disgusting in shape. They wanted them much flatter in shape than I could make them; and the flowers that I wasted in trying to accomplish that end were more than I liked to own. I made one of those frames, and to my great delight I found that I did not require more than half the flowers, and could at the same time make them large enough for anyone's taste, however extravagant, and as flat as a table, with as many modifications between that and a pyramid as fancy might choose.

And now, before going into the arrangement of the bouquet, a few words about the preparation of the materials. We will take the Camellia in the first place, as being the most prominent object at this season. I never cut a leaf or a leaf-bud with Camellias for hand-bouquets, knowing that those most forward buds are the most likely ones to produce a crop of flower buds next year; and on this principle I am always most willing to cut Camellias, because, instead of injuring the plants, which is the case if a couple of leaves are taken with the flower, the removal of the flowers soon after expanding concentrates the strength of the plant into those buds which produce next year's crop. For bouquets or the hair proceed as follows with Camellias: Take the bloom between the forefinger and thumb of the left hand, and with the other thrust a piece of copper or brass wire through the base of the flower, bending the two ends down to meet and be twisted together so as to form a stalk. If the flower is quite fresh this will be sufficient; but if the flower is old, and likely to fall to pieces if roughly shaken, put another wire through the flower crosswise to the other one, twisting all the wires together. If for the hair, a nice fresh leaf may be placed on one or other of the wires, to lie between the hair and the bloom. If for a bouquet, two leaves may be wired separately, and arranged at pleasure when making-up. Half-open buds may be wired in the same way, placing a leaf on the wire at the same time. Many other flowers require wiring as well as Camellias. If their stalks will admit of it, thrust a very small wire through them some distance above the base, and twist the ends round the stem to make the flower stand upright. If the stalks are too slender for this, the only way to do is to tie them to a small piece with very thin copper wire.

And now to the arrangement. Having the frame made, the flowers gathered, and those wired that require it, place the frame with the handle through the hole of an inverted flower pot, which is the most ready means of getting your hands at liberty in the course of making-up. Now get a handful of *Selaginella denticulata*, or dried dyed moss of the shops. If none of this useful *Selaginella* is to be had; place this on the top of the frame, as nearly as possible in the position it has grown, keeping it higher and denser in the centre, or as near the shape of your intended bouquet as possible, leaving the loose ends hanging carelessly over the hoop. Take, say, a

white or red Camellia for a centre, and passing the wire down through the moss, tie it firmly to the wire sticking up in the centre, and then pull it gently down to the desired height, its outer petals resting on the green moss.

Next, proceed with the arrangement of flowers of a formal character, with due regard to colours, placing each flower or truss so as to stand out clear of its neighbours. The outside row should be placed so that one-half of the flowers extend over the hoop; but should not be so exact as if a compass had been used. The groundwork, as it were, having thus been formed, we next proceed to fill-up with flowers of a more graceful character, such as *Justicia coccinea* and *J. speciosa*, in single lateral spikes, single twigs of *Deutzia gracilis*, or *Spiraea japonica*, Rose buds, Snowdrops, Cyclamens, little twigs of Heaths and Epacris, or anything that is small and twiggy, to stand-up above the great body of colour, to give the whole a less formal appearance. These are placed in the widest spaces left between the other flowers, and all the lesser spaces are filled-up with small fronds of Ferns—*Adiantum* assimile being one of the most useful for this purpose. The bottom pinnae of Ferns used should be stripped off, for the purpose of getting them down through the moss. Having all thus filled-up, gather all the stems together, and tie them to the stem in the usual way, and then add a border of *Adiantum cuneatum* or *A. formosum*, and the bouquet is complete.

I venture to say that young ladies will find a bouquet made after this fashion will stand a good deal of "knocking about" on a ball-night without getting out of shape. The saving of time and material is something wonderful; so that the frame system has many advantages. I intended this paper to extend to table decorations as well; but I think it is unnecessary, as anyone who is scarce of flowers, with ordinary ingenuity will be able to apply these remarks to other purposes than hand-bouquet making.—R. INGLIS (in *The Gardener*).

GARDENERS' ROYAL BENEVOLENT INSTITUTION.—Dr. Hogg has been elected a Vice-President of this Institution in the place of the late Charles Lawson, Esq.

## DOINGS OF THE LAST AND PRESENT WEEKS.

### KITCHEN GARDEN.

We have recently alluded to the remarkably fine weather for forwarding out-door operations; the wind has been veering round from east to north, and frost has set in, accompanied by fog, so that working out of doors amongst bushes and trees is very unpleasant. Before the ground became too hard some rough manure was spread over it, so that should the frost continue we shall be enabled to finish the trenching.

We had commenced to plant-out the *Sea-kale*, but the frost prevented our continuing the work. Our plan with this vegetable is to sow a few rows annually, and also to plant-out the best of the roots that have been used for forcing, and all the small roots that are not strong enough to be taken to the forcing house. The ground in which the *Sea-kale* is planted is trenched and moderately rich, and at the time of planting some coal ashes are placed round the roots.

We alluded last week to the early *Potatoes*, and it may not be out of place to draw attention to the general crop, as many of our readers may be desirous of purchasing sets. The experience obtained here in regard to the American sorts would lead us to the conclusion that they are not worth growing. American *Rose* does not throw much haulm, but it gave us only the most miserable apology for a crop, and the less said about the quality the better. Boston Red yielded enormously, but the *Potatoes* were of every conceivable shape; the produce had an earthy flavour and a waxy texture. Of Springfield White we had three years ago two or three small *Potatoes* that were cut-up into about a dozen sets, which produced about one hundredweight and a half of the most ugly specimens ever seen, and quite uneatable. Indeed, after several trials conclusive evidence was afforded that our soil was not suitable for the varieties introduced from America. There are some new sorts from that continent being introduced this year to the public. Most of them we have seen growing, and tasted after being cooked; they were well-shaped, of a good and distinct flavour from our English varieties, and the produce uniform in size. They have been accurately described by Mr. Barron in the "Proceedings of the Royal Horticultural Society."

The *Potatoes* that can be recommended for a general crop, and which should, if possible, be grown in the field, are Dalmahoy, one of the earliest and best of the Regent class, and Walker's Regent, which succeeds this and is rather more productive. For the latest crop Sutton's Red-skinned Flourball is as good as any, and its freedom from disease is an important point in its favour. This variety was obtained from Messrs. Sutton, of

Reading, when it was sent out for the first time, and has since then been annually grown at Loxford Hall by the acre, so that there has been ample opportunity to test it. Its freedom from disease is remarkable. This year a diseased tuber may be found here and there, but they are not worth notice when from one-half to two-thirds of the entire crop of Regents is diseased. It is considered a profitable investment to obtain a supply of seed Potatoes from Scotland annually.

Sow early *Turnips* on a warm border. The main crop of *Onions* may also be sown; White Spanish, Brown Globe, and James's Keeping are our selection.

#### FRUIT AND FORCING HOUSES.

**Pinerics.**—We shall, if possible, renew the Pine beds this week, and will make a trial of what is to us a new plunging material. It is difficult to obtain tan, and when this is used an anxious time follows in case the bed should become overheated, and thus destroy the roots of the plants. The only way to be safe is to stand the pots on the surface until the heat subsides to 90°, and when it declines to 85° this temperature can be maintained by the aid of the heating apparatus. It is not necessary that the bottom heat should rise above 85°, nor should it fall many degrees below it. We use cocoa-nut fibre refuse for plunging pots in cool houses, and out of doors this material, when fresh, throws out a gentle heat, and will probably, with the aid of the hot-water pipes, give out enough for the Pines; it is also a much better material in which to plunge pots, and there will be no danger from overheating. During the present severe weather, rather than overheat the pipes, let the night temperature fall to 65°; in mild weather it may be maintained at 70°. Utilise all the sun heat possible by shutting-up early in the afternoon.

*Melons* that were sown in the first week of January will now be ready to plant out. The compost should be prepared as recommended in a previous number, and taken into the house a few days before putting out the plants. The glass should be perfectly clean outside and inside of the house, and all internal woodwork should be washed with water in which a little soft soap has been dissolved. Coat the brickwork with limewash, and if a pound of sulphur be added to each pailful of the wash all the better.

*Cucumbers* are improving; the young leaves that are now forming are thicker in texture, and the growths are strong. A night temperature of 70° suits them best, while 65° is a good minimum for the Melon house.

**Orange House.**—Very few establishments have a house entirely devoted to the culture of the different varieties of dessert Oranges, and it is not generally known that fruit of the most delicious flavour, far superior to any imported, can be grown in England. The few trees we have are now in flower, and are growing in a house where the night temperature is about 60°. Tangerine, St. Michael's, and Maltese Blood are the most desirable sorts to grow. The fruit generally sets freely, but the atmosphere ought to be moderately dry when the blossoms are expanding.

*Fig trees* in pots are also starting into growth. It is well not to have the plants in a house with a high night temperature, and especially where there is not much circulation of air during the day, as such treatment causes a weak growth, and the fruit will probably drop off. Our trees are potted annually in October or November, and surface-dressed as soon as they are in active growth. It is best to have a house entirely devoted to their culture, and they should not be far removed from the glass. A temperature of 60° is quite high enough at night, and better let it fall a few degrees below this than rise above it in cold weather. The pots are not plunged with us, and the fruit is generally of excellent flavour. Shut the house up early in the afternoon, and syringe the plants at the same time. Figs luxuriate in the moist atmosphere produced by such management. Fig trees also require to be watered carefully. When in full growth they take a large supply, and if manure is added to it at each alternate watering so much the better; but if they receive an excess of water signs of distress will be soon apparent, deep green leaves will assume a yellowish green colour, and when this is the case no after-treatment will cause them to produce good fruit that season. Liberal drainage is essential in this as in the case of all trees or plants requiring a large supply of water.

#### STOVE AND GREENHOUSE.

No class of plants will better keep-up a supply of flowers at this season than the Orchid family. Take two species only—*Dendrobium nobile* and *Lycaste Skinneri*. Where in the whole range of exotic plants can two others be found that are so easily cultivated, and will at the same time continue to produce such a lavish profusion of beautiful flowers? The Chinese *Dendrobium* should be kept in stove heat when making its growth, but the plants during autumn and winter can be placed in a greenhouse or cool vinery, Peach house at rest, &c., and be removed to the stove when required. *Lycaste Skinneri* is a cool-house Orchid; also in the cool house, *Odontoglossum crispum* and *Coleogyne cristata* furnish abundant supplies of the most lovely flowers. The atmosphere of the cool house should

only be moderately moist, otherwise the flowers are liable to spot. The temperature at present is 45° to 50° at night. The above Orchids are as easily grown as any other greenhouse plants; indeed, much more easily to the uninitiated than *Heaths* and many other Cape plants.

#### FLOWER GARDEN.

All the beds and borders planted with spring flowers should be free from weeds and have a neat and orderly appearance. Hyacinths, Tulips, and all other bulbous-rooted plants are through the ground; our beds were dressed over the surface with fresh soil, which improves the appearance and is beneficial to the plants. We are also busily engaged propagating and potting-off bedding plants. Owing to want of space we did not pot-off the Zonal Pelargoniums in autumn; now that the late vineries are cleared of Grapes, there will be plenty of accommodation for them. Pruning Roses, manuring and digging the beds. If herbaceous borders have not been lightly forked over this ought to be done at once, as many of the early-flowering plants are in a forward state.—J. DOUGLAS.

#### TRADE CATALOGUES RECEIVED.

B. R. Davis, Middle Street, Yeovil.—*Catalogue of Vegetable, Flower, and Agricultural Seeds, &c.*

F. & A. Dickson & Sons, 106, Eastgate Street, Chester.—*Catalogue of Vegetable and Flower Seeds, &c.*

Harrison & Sons, Royal Midland Seed Warehouse, Leicester.—*Seed Catalogue.*

#### TO CORRESPONDENTS.

\* \* \* We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

BOOKS (*C. Waghorn*).—"Kitchen Gardening for the Many" will suit you. You can have it free by post if you enclose five postage stamps with your full direction.

PLUM SHOOTS (*E. Walpole*).—The parasites are the Vine scale, *Coccis vitis*. Brush over them with a creamy mixture of soft soap and spirit of turpentine.

POTATO DISEASE (*B. S.*).—We shall readily insert a detail of results in practice, but your theoretical conclusions seem to be refuted by the fact that tubers of the Potato imported from its native country produced diseased plants the first year.

POULTRY DUNG (*T. W. T.*).—In moderation it may be used for any crop. The addition of lime is no improvement. We should store it in layers, alternating with layers of earth.

CARPET BEDS IN BATTERSEA PARK (*W. M.*).—Your recollections of the bedding are too general to answer your question definitely. A groundwork of Feverfew, with *Alternanthera* filling in the pattern, was most prevalent in the carpet beds last year. In a few instances both Gold and Silver-leaved Geraniums were used as a groundwork for *Colours Verschaffelt* and *refulgens*. The colour of the latter *Colours* resembles, and might be mistaken for *Perilla*. *Chamaejasme discantha* and *Alternanthera magnifica* as groundwork were also used, as were *Centauria candidissima* and *Iresine Lindeni*. There was no *Cineraria maritima* used last year. Feverfew, *Stachys lanata*, *Cerastium*, *Santolina*, and *Veronica incana* as hardy plants might answer your purpose. The only dark-leaved hardy plants that we know are *Ajuga reptans rubra* and the purple Trefoil, neither of which, we fear, would give satisfaction as summer carpet-bedding plants.

PELARGONIUM BOWERI.—"J. S." wishes to know where he could find the true *Pelargonium Boweri* said to have a yellow flower?

PINE APPLES (*S. W. S.*).—For summer we should advise Queen, and for winter Black Jamaica and Smooth-leaved Cayenne. In your case we should prefer to plant-out in the bed instead of shifting into fruiting pots, and after the fruit is cut a sucker may be encouraged and left to the old stool, the old plant being cut away. Thus by top-dressing you may keep the bed furnished with plants for some years without the trouble of repotting, &c. Very nice fruit have been grown in this way, but our best cultivators produce their finest fruit on plants in pots.

GRAVELLING CARRIAGE DRIVE (*G. E.*).—We should remove as much of the old gravel as is reduced to a muddy state, have the walk picked-up as you propose, and the surface made regular. We should then put on a thickness of the rough building-stone chippings, which we fear are soft, putting them on so as to give the centre of the drive a rise of 7 inches above the sides, which should be 2 inches below the edge or grass verge. We should put on 2 inches of chippings that are so small as to have a neat appearance, and admit of the drive being cleaned, without giving it when raked a rough aspect, and making it necessary to remove the larger portions of stone repeatedly. The only matter we have a doubt about is the stone. If ordinary

freestone it will do only for the foundation; the surface should be of a hard material, as gravel 2 or 3 inches thick. If the stone is soft the drive will, after a season, be very little better than it is now, and it is well to consider whether it would not be cheaper to give a coating of gravel than expend time and labour on that which will not mend matters.

**WHITE AND DARK-FOLIAGED BEDDING PLANTS (T. W. J.).**—As you want plants that are between 1 and 1½ foot in height, our selection is confined to *Centaurea ragusina* (candissima), which in its improved form, *C. ragusina compacta*, is of dwarfier, more compact habit. It is increased by cuttings of the side shoots now, placed in a gentle heat. *Cineraria maritima* would suit, but the plants must be raised from cuttings, as those obtained from seed are not of good colour, and grow too strongly in the first year. The cuttings may be put in now or early in March in sandy soil in gentle heat. The best thing for associating with these is *Iresine Lindem.*, which is readily increased by cuttings in heat. The dark-leaved Beets, as Dell's Crimson, accord well with the *Centaurea* or *Cineraria*. The seed may be sown in boxes in a cold frame or very gentle heat early in April, and the seedlings pricked-off, when the rough or second leaves appear, about an inch apart in boxes, shading for a few days, and when established admit air and light freely, and plant in May. You may instead sow in the second or third week of April where the plants are to remain.

**SELECT GLADIOLI (D. R.).**—You will find all the information you require in "The Gladioli: its History, Cultivation, and Exhibition," by our contributor "D. Deal," published by L. Reeve & Co., Henrietta Street, Covent Garden. Is. We subjoin a list of the best twenty-four:—Adolphe Brongniart, Delicatum, Beatrix, Eugene Scribe, Eurydice, Horace Vernet, Jupiter, Legouve, Madame Furtado, Madame Desportes, Marie Stuart, Meyerbeer, Michel Ange, Norma, Orpheo, Phobus, Primatic, Schiller, Sir J. Franklin, Ulysse, Virgile, Princess Mary of Cambridge, Virginibus, and Mrs. F. Whitbourn.

**CHARCOAL FOR PLANTS (Wife and Mother).**—Any kind of charcoal will do to use as drainage or mix with the soil for potted plants. About the bive next week.

**CINERARIA LEAVES CURLING (S. B.).**—If the edges curl towards the inner surface it is their natural mode of growth.

**BURNT CLAY AS A TOP-DRESSING (A. Scott).**—It will be beneficial to a grass field, of which the soil is of a retentive character. It is best to apply it now.

**HAMILTON'S SYSTEM OF PINE CULTURE (H. R.).**—His book was published thirty years since, and is probably out of print. The following is his mode of culture:—Suckers taken off in October or November, plant into pots from 5½ to 6½ inches diameter at the top, and plunge overhead in the tan; this causes them to strike root in a very short time. In this state let them remain without any water, except occasionally sprinkling them with the syringe, and this, in the winter season, only in the early part of the day. In March transplant into pots from 7 to 8 inches at the top; and at this shifting plunge up to their rims in a heat of about 85° or even 90° for a week or two after potting, to accelerate their striking root into the fresh soil. As soon as planned sprinkle them over their leaves with water 2° or 3° warmer than the atmosphere in the house; and this mode of watering ought to be repeated twice a day in the summer season, except in very cloudy weather, when steaming the house will be found to keep the atmosphere and the plants sufficiently moist; but as the season advances only water the plants over their leaves in the evening, at the time of closing the house, whilst the sun is still shining on the glass, and before its rays are much diminished. As soon as the heat rises in the tan give a good watering at their roots at this season, to settle the soil about them, but after this watering the soil ought to be kept sufficiently moist by watering the plants all over their leaves, every evening, after sunny days. About the latter end of May again shift into larger pots, but at every one of these shifting the bed must be replenished with fresh fermenting materials, as a brisk bottom heat is of the greatest importance for two or three weeks after the plants have been fresh potted. If there is much sun at the time shade the plants rather than give much air for a week or two after potting, but at all other periods they ought to have plenty of air. The size of the pots at this shifting ought to be from 9 to 10 inches diameter at the top. The plants are every way treated as before, well watered over their leaves after bright sunny days, also plenty of water thrown on the pathways, or on the flues, pipes, &c. If the plants are intended to be turned out into the tan in the autumn they may thus remain until the bed is ready for them, but if they are to be fringed in pots the following season they ought to have their last shift early in August. The size of the pots required will be from 11 to 12 inches diameter at the top, and in order to grow the Queen varieties, as well as the Enville, to a large size they ought to have their last shift ten or twelve months previously to fruiting. In the fruiting stove he recommends the maximum heat of the house in November, December, and January, by artificial means not to exceed 65°, the minimum 55°. In spring and autumn, if fruit are to be swelled, maximum by sunshine 80°, minimum 68°, medium by artificial heat 70°. In the summer the maximum, under the effect of strong sunshine, may rise to 90°, and may be allowed to drop as low as 70° in the morning. In very bright sunny weather, Mr. Hamilton says, the plants in fruit had better be shaded than have admitted to them too much air at any time of the day. From this recommendation of shading we entirely dissent, considering it to be one of the most incorrect practices in modern Pine culture. In this country, where we have so much gloomy weather and consequent deficiency of light, there is never such an excess for any plant that is a native of the tropics as to render necessary shade when it is established, or its fruit swelling. It is a recommendation not in accordance with the dictates of nature, though such a recommendation was very necessary in those bygone days when Pine plants were cultivated almost without roots. We condemn the shading system altogether for plants of any age which are established with roots. Applied to fruit or fruiting plants it must certainly occasion a considerable sacrifice of their best qualities. A far more correct principle is, instead of shading, to secure in fervid weather a genial humidity to the interior atmosphere. By this method the plants will always maintain a dark, healthy green, have stems stout and well rooted, with leaves short in proportion, wide and fleshy, and well able to show and swell-off fruit of the first quality. In order to swell this fruit to a large size no air ought to be given until the thermometer reaches 80° or 85°, which will generally reach that point in the morning by nine or half-past. To keep it down to this give it the benefit of air until half-past ten, then close the house and water them over their leaves, thus let them remain until half-past two or three in the afternoon, letting them have all the benefit of light and sun. At half-past four close the house, syringing again over the leaves of the plants, which will keep them moist during the whole of the night. Newly-potted plants will be benefited by a heat of about 90° for two or three weeks, after which time it may fall to 85° maximum and 80° minimum, but in the winter

75° will be sufficient. The bottom heat required for those plants which are to produce several fruit from the same plant ought to be as equable as possible, at a medium of about 80°, and not to fluctuate more than 3° above or below; however, a plant will swell well in summer in a bottom heat of 70°, but in winter, when the superincumbent atmosphere is kept cooler, the plants that are swelling their fruit will make little progress except the bottom heat be about 75°.

**INSECTS (A Subscriber's Sister, Co. Cork).**—As well as we can judge from the shattered and rubbed state of the specimen sent by you, it was the female of the pale Tussock Moth, *Dasychira pudibunda*, a rather common species. —I. O. W.

**NAMES OF FRUITS (W. Atkinson).**—We do not recognise either of the specimens. Are they not local seedlings?

**NAMES OF PLANTS (A. D. Ramsay).**—*Ruscus Hypoglossum*, or double-leaved Butcher's Broom.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### EXHIBITED BIRDS MUTILATED—HAMBURGS.

I AM sorry to find that the mischievous race of tail-pullers is not yet extinct. I sent a Black Hamburg cockerel to the late Bristol Show, where he won the first prize, and returned minus both sickle feathers. He is thus rendered useless for exhibition purposes for the rest of the season. Of course, I cannot say positively that the mischief was done at the Bristol Show, but I think you will agree that the following facts have a very suspicious look.

In 1870 I won the first prize with a Black Hamburg cock at this Show, and the bird returned home with one sickle feather the less. In 1871 I only won the second prize, and so, I suppose, escaped scot free. In 1872 I won both first and second prizes, and when the two cocks returned home I found that a sickle feather had been drawn from each. In 1873 I was third only, and, I suppose, the cockerel was not considered worth meddling with, for he was returned unharmed. This year I have again won the first prize, and the sequel I have already mentioned—viz., both sickle feathers are taken. It seems to me that it will be only prudent to steer clear of the Bristol Show in future, lest my friend, whoever he may be, should take a fancy next time to the whole bird.

I see "WILTSHIRE RECTOR" complains of want of support from the Hamburg breeders, but I think the reason is not far to seek. It is a long, tedious, and expensive journey from Lancashire, the Hamburg head-quarters, to Bristol, and as long as the Bristol Committee offer only a £2 prize, and charge 7s. 6d. entry, it is not to be wondered that the north-country breeders should prefer to keep their birds for the shows nearer home, where they can win a £2 prize for a 5s. entry fee. It may be said that there is a Hamburg cup offered, but I do not think that a fifth chance of a cup is much inducement. I do not, however, speak from any personal feeling in this matter. I have always supported the Bristol Show, and I shall be sorry to have to give it up.—W. SERJEANTSON, *Acton Burnell, Rectory*.

P.S.—Since writing to you I have learnt from a friend, Mr. Kilvert, Palms Hill, Wem, who also exhibited some Black Hamburgs at the late Bristol Show, that his cockerel came home in the same plight as mine—viz., with both sickle feathers missing. This makes it still more improbable, I might say impossible, that all this mischief could have been done by accident.—W. S.

### NOTES FROM THE YARD.

As I think my poultry book would compare favourably with many others, I will state a few facts from it.

Last month the produce of two yards, one containing a Dorking cock and seventeen mixed hens, and the other a Brahma Pootra cock with five hens, was 217 eggs, against 252 laid by the same number last year. Now I think this very good, especially as it is said to be a bad laying season. The Brahmas were laying from November, and although none have yet been made use of, there have been several broody hens. The largest yard have the run of a large field and a long run besides; the others are in a small yard. We feed on whole corn in the morning, and ground oats slaked with milk or water. Last year we had from twenty-four hens and two cocks 1866 eggs, and never wanted for new-laid eggs. We reared a number of chickens. In my next I will say something as to the different breeds.—CULTOR.

### CROWING HEN PRODUCTIVE.

I SEE by your answer to "SPANISH COCK'S" inquiry concerning a crowing hen that it is useless to keep her, as she will never lay. I have a White Dorking hen that crows; she always answers the cock in the morning, and is the best layer out of five. She has laid twenty-six eggs since the 21st of last December to the 1st of the present month inclusive, and she has not left off yet. She is a good sitter and mother as well. Her age is from four to five years; she has always crowed since I have had her. I

received the same advice, but would not act upon it, and she has well repaid me during the last two years.—G. MOSELEY, 8, Rose Cottages, Alpha Road, Surbiton Hill.

### HITCHIN POULTRY SHOW.

WE were very sorry to find that the liberal prize list offered at this Show did not attract a more liberal entry. It would have been better to have thrown the classes open to all ages, as at this season chickens can compete quite fairly with old birds; but even then we fear it is too late for such a liberal prize list to meet a fair return from exhibitors. The attendance of the public was also very small, as might, perhaps, be expected; the place having little population of its own, and being just too far from London and other towns to attract many visitors.

The quality of nearly all the classes was very high, and the 260 pens of poultry were, almost without exception, shown in single tier, with the Pigeons on the top, an arrangement which made the inspection and judging of the pleasantest description. The Exhibition was held in the Corn Exchange, a fine sky-lighted building, the only fault of which was that on such a day as last Thursday it was somewhat cold. The pens were all well littered with clean chaff, and it gives us pleasure to state that at no show this season have we seen the birds better or more carefully attended to, the whole management reflecting the greatest credit on all concerned, and forming a curiously strong contrast to a recent notorious *fiasco*. It is much to be hoped that so excellent and thoroughly straightforward an enterprise may be enabled, in spite of the present disappointing results, to occupy another time a better position, and become one of the recognised fixtures of the year.

Both classes of *Dorkings* were very good and very small, the Silver-Gray cup and second being each taken by excellent and well-known birds; and the cup pen of Coloured birds being of such grand size and quality that more than one good judge thought them the best pen in the Show. We have rarely seen better birds, especially in chicken classes. *Cochins* were not so good, neither Buffs nor other colours being at all up to the mark, and the two classes only numbering eighteen entries between them. Judging, also, was far from easy, there not being one thoroughly good pen in either class. The cup pen contained a very good cock, but not a good hen. *Brahmas* were excellent, particularly the Dark; but in this class we thought the judging at fault, much the best pair being the third-prize, both cockerel and pullet in which were all but perfect; while in the cup and second-prize pens the pullets were only fairly good, and both cockerels were a dirty yellow, coarse in comb, bad in figure, and with immense ill-shaped tails. The next best pen in our opinion was fourth; it contained a beautiful pullet and a very handsome though small cockerel, which won the third prize at the Palace, and had, at least, symmetry to recommend him. There were also most excellent birds in Mrs. Baillie Hamilton's and the Rev. J. Richardson's pens. In Lights the cup was won by Mr. Dean's beautiful Birmingham cockerel, tolerably well mated, and which is certainly the best bird of the season. The other prize pens were fair average birds, and Mr. Haines's pen contained, we believe, the Palace winner, but so badly mated as to throw him out, though the cockerel was certainly, next to Mr. Dean's, the best in the class. *French Fowls* were good, as will be seen from the prize list; *Houdans* being specially noticeable for bringing again well to the front the old name of Mr. O. Quibell. In *Crève-Cœurs* we confess we would have liked to make-up a pair by taking one bird from Mr. Wood's pen and one from Mr. Dring's.

Passing to the smaller birds, *Game* were fairly good classes, but many of the birds rather past their best condition. In *Spanish* there were but half a dozen pens, and we noticed that the combs of nearly all the cocks were going black with the cold. The winning pen contained a capital cockerel and one of the best pullets we have seen for two years, being very smooth and large in face with a capital deaf ear. Spangled *Hamburghs* "brought in" one of the genuine old "Lancashire" breeders with a capital pen, Mr. Beldon having to go second. The Pencil class we did not think quite so good, and are not sure we should not have preferred the second-prize to the first; but at the time of our visit the first-prize cock was evidently going rather out of order from the cold. In Any other variety the winners were a really grand pen of Golden Polish. The Selling class contained several good pens, which we observed were "sold" in nearly every case. We especially noted a highly-commended pen of Buff Cochins, the pullet in which would not be dear at £5. The Local class brought out Mr. Shrimpton's grand Partridge cock, which, in all essential points, is the best Cochin of the season, though certainly too dark in colour. *Game Bantams* were good—excellent good; and compared with others, were quite a strong class, numbering twenty-one pens. We did not think the winning pen well selected. Any other variety only contained a dozen pens, the first prize going to a good pair of *Seshrights*.

All the classes of *Ducks*, though not large, were far beyond

the average of a country show. The winners in Aylesbury and Rouens were fit for any competition. In Black East Indians Mr. Sainsbury took the honours with rather badly-matched but exquisitely-coloured birds. In Any other variety Mr. Leno won first with Mandarins, and second with his Carolinas. There was also in the class a pair of the now-seldom-seen White Call Ducks. *Pigeons* were remarkably good, and compared with the prize list in much greater comparative force. We are not sure that we should endorse the pens selected for the honours in Turbits and Jacobins, but only had time for a very hasty examination of this department of the Show.

**DORKINGS.**—Silver-Gray.—1 and Cup, O. E. Cresswell, Early Wood, Bagshot, 2, L. Wren, Lowestoft. 3, W. H. Denison, Woburn Sands. Coloured.—1 and Cup, F. Parlett, Great Baddow. 2, Rev. J. A. Baker, Biggleswade. 3, R. Cheesman, Westwell, Kent. *hc*, J. Watts, King's Heath, Birmingham.

**COCHINS.**—China.—Buff or Cinnamon.—1, Capt. T. S. Robin, Petit Menage, Jersey. 2, J. Watts. *hc*, W. A. Burnell. Any other colour.—1 and Cup, W. A. Burnell. 2, H. Beldon, Giltstock, Bingley. *hc*, Mrs. E. Fryor, Welyun; J. K. Fowler, Aylesbury; T. M. Dorry, Gedgey.

**BRAMAHS.**—Dark.—1, Cup and 2, Horace Lingwood, Creeting. 3, L. Wright, Crouch End, Harnsey. 4, W. Mansfield, Cambridge. *hc*, Hon. Mrs. A. B. Hamilton, Woburn. *hc*, Dr. J. Holmes, Chestfield; Hon. Mrs. A. B. Hamilton; Rev. J. Richardson, Sandy; Rev. J. D. Peake, Laleham Vicarage; E. Pritchard, Tettenhall. *c*, P. Unsworth, Louton, Newton-le-Willows. Light.—1 and Cup, T. A. Dean, Marden, Hereford. 2 and *c*, Capt. W. Saville, Wye. 3, J. Long, Bromley Common. 4, H. M. Maynard, Holmewood, Isle of Wight. *hc*, P. Haines, Palgrave, Diss.

**BEVÉ-CŒURS.**—1 and Cup, R. B. Wood, Uttoxeter. 2, W. Dring, Faversham. *hc*, W. Mattinger, Radhall, Ross. *hc*, R. B. Wood (2); H. Feast. *hc*, J. J. Malden, Biggleswade.

**HOUDANS.**—1 and 2, W. O. Quibell, Newark. 3, W. Coppelston, Lostwithiel. *hc*, W. Dring; R. B. Wood; Mrs. Vallance, Sittingbourne; W. O. Quibell. *c*, A. C. Bryant.

**GAME.**—Black-breasted Red.—1, R. Hall, Cambridge. 2, S. Field, Bicester. 3, J. Mason, Gloucester. Any other variety.—1 and 2, R. Hall. 3, H. E. Martin, Spetchley, Worcester.

**SPANISH.**—1, F. James, Peckham Rye. 2, S. W. Hallam, Whitwick, Leicester. 3, J. S. Dew, Gamlingay Mills.

**HAMBURGS.**—Gold or Silver-spangled.—1, N. Marlor, Denton. 2 and 3, H. Beldon. *hc*, M. M. Cashmore, Sheepshed, Loughborough. *hc*, W. K. Ticken, Ipswich; Rev. R. G. Green, Aupthill. Gold or Silver-pencilled.—1 and 3, H. Beldon. 2, J. Walker, Birstwith, Ripley. *hc*, W. Speakman, Nantwich.

**ANY OTHER VARIETY.**—1, T. Dean, Golden Poland. 2, H. Beldon. 3, Rev. N. J. Biddle, Newbury (Male). *hc*, J. Hinton, Warmistone (Silver Poland); R. Booth, Chesterfield (Male); S. P. Broad (White Silks); J. K. Fowler; J. Walker (Black Hamburgs).

**SELLING CLASS.**—1, W. Mansfield (Dark Brahma). 2, Mrs. T. Ponsonby, Goldington Bury, Bedford. 3, M. Leno, Markyate Street (Light Brahmas). *hc*, D. Young, Leamington (Buff Cochin); R. Cheesman (Coloured Dorking); J. K. Fowler (White Cochin); T. M. Dorry (Partridge Cochin); H. Beldon. *c*, Rev. N. J. Biddle (Male).

**LOCAL CLASS.**—Any variety—Open to amateurs resident in Hertfordshire and Bedfordshire.—1 and 4, B. H. Shrimpton, Leighton Buzzard (Cochin). 2, G. Crick, Stopeley, Luton (Cochin). 3, S. Lucas, Hitchin (Light Brahma). *hc*, G. Oakley, Luton (Partridge Cochin). *hc*, H. Ford, Ridgmont, Woburn (Dark Brahma); G. Spencer, Stotford (Cove-Cœur); G. E. Porter, Sandy (Partridge Cochin); Rev. C. C. Ewbank, Biggleswade. *c*, Rev. J. G. A. Baker (Coloured Dorking); Mrs. E. Fryor (Partridge Cochin).

**BANTAMS.**—*Game*.—1 and Cup, M. Leno. 2, Capt. Wetherall, Loddington. 3, W. F. Entwistle, Westfield, Bradford. *hc*, E. Payne, Cardiff; T. Randall, jun., Guildford; R. Kemp, Holloway Road, London; G. Lucas, Hitchin; J. Eaton. Any other variety.—1, M. Leno. 2, C. Reed. 3, J. Mayo. *hc*, W. H. Shackleton, Bradford. *hc*, T. E. Thistle, Lowestoft; G. Oakley.

**DUCKS.**—Aylesbury.—1 and 2, J. K. Fowler. *Rouen*.—1 and Cup, F. Parlett. 2, T. J. Upsher. 3, J. K. Fowler. *hc*, T. J. Upsher. 3, K. Fowler. Black East Indian.—1, Cup and 3, G. S. Sainsbury, Devizes. 2, J. W. Kellaway, Merston, Isle of Wight. *hc*, G. Oakley. Any other variety.—1 and 2, M. Leno (Fancy). *hc*, E. K. Fordham, Ashwell; J. Watts; W. Butcher, Notting Hill (Mandarins).

### PIGEONS.

**PUTTERS.**—Cocks.—1, N. Hill, Edling. 2 and 3, R. Fulton, New Cross. Hens.—1, R. Fulton. 2, N. Hill. 3, W. Nottage, Northampton.

**CARRIERS.**—Cocks.—1, Cup and *hc*, R. Fulton, Hereford. 2, E. Walker. 3, P. R. Spencer, Hereford. *c*, W. E. Nalder, St. John's Street Road, London. Hens.—1, R. Fulton. 2 and 3, E. Walker. *hc*, W. E. Nalder; P. R. Spencer; R. Fulton. *c*, W. E. Nalder.

**INDIAN.**—1 and 2, E. Fulton. 3, H. M. Maynard. *hc*, H. Yardley, Birmingham. *c*, J. W. P. James, Hereford; P. R. Spencer.

**TUMBLEDS.**—1 and Cup, H. Yardley. 2, J. Ford, Monkwell Street, London. 3, R. Fulton. *hc*, J. Ford; K. Fulton.

**OWLS.**—1 and 2, R. Fulton. 3, W. Whitaker, Henlow. *c*, H. W. Webb.

**TURBITS.**—1, S. Salter, Egrove. 2 and *hc*, R. Fulton. 3, O. E. Cresswell.

**ANTWERPS.**—*Homing*.—1 and 2, Capt. G. Edwards, Hyde Lodge, Hammer-smith Mill. 3, J. Sparrow & Cotton, Grosvenor Mews, London. *hc*, J. W. P. James; P. Lobbeck; J. Buzzard, Bedford. *c*, J. Mantel, Newport Pagnell; J. Sparrow & Cotton, Grosvenor Mews, London (2).

**JACOBIENS.**—1, J. Thompson, Bingley. 2, O. E. Cresswell. 3, G. Hardy, Goldhawk Road, Shepherd's Bush. *c*, G. Hardy; J. Thompson (2).

**FANTAILS.**—1 and Cup, H. M. Maynard. 2, J. S. Loversidge, Newark. 3, H. Yardley. *hc*, J. S. Loversidge; P. R. Spencer.

**ANY OTHER VARIETY.**—1, R. Fulton. 2, H. Yardley. 3, J. S. Price, Potter's Bar. *hc*, P. R. Spencer. *c*, G. Hardy; A. J. Barnes, Gloucester (Black Magpies); J. S. Price (2).

**DRAGONS.**—Red or Yellow.—1 and 2, S. C. Betty, Park Street, Regent's Park, London. *hc*, W. H. Mitchell. *hc*, W. Hill, Handforth (4). Blue and Silver.—1, 2, and *hc*, W. Hill. *c*, W. H. Mitchell; J. G. Dunn, Newcastle-on-Tyne; W. Hill. White.—1 and 2, W. Bishop, Dorchester. *hc*, W. H. Mitchell, Moseley, Birmingham; W. Hill.

**JUDGES.**—Poultry: Mr. R. Teebay. Pigeons: Mr. F. Gresham; Mr. P. H. Jones.

### FAKENHAM POULTRY SHOW.

(From our Usual Reporter.)

THIS year the entries, the quality of the birds, and more especially the improvement in the quality of the county birds, proved that the exertions of the energetic Committee were not expended in vain; for while the entries were large as compared with the past, and the arrangements and management better, yet the great point observable was the superiority of the stock shown by the local exhibitors, which in some instances exceeded anything shown in the same classes by exhibitors from a distance, very few pens passing unnoticed in any section.

Of *Dorking* cocks of the coloured variety, a grand broad and deep cockerel was awarded the first prize and county cup for the section of the large varieties. The second and third prizes went to large adult birds. In hens, which as a class were superior to the cocks, a grand hen stood first, the rest also being very good. In other colours of cocks the birds were only of ordinary merit, but the hens were such as are rarely seen, the cup for the *Dorking* section falling to the first-prize Silver. *Cochin* cocks made a capital class, the winners being Buffs, a veteran bird carrying-off the cup, closely pressed, however, by a most exquisite White hen belonging to the same exhibitor; in the latter class a capital Buff somewhat out of condition was second. Class 6, for other coloured *Cochin* cocks, contained good White and Partridge birds. *Brahma* cocks (Dark), were a large but not good class, although some of the birds were good in shape and sound in colour. Hens were also numerous, and the winners very fine, the cup being awarded to Mr. Lingwood's fine hen. Light *Brahma* cocks exhibited a great improvement in colour and marking; the hens also being a fair lot. *Game* were one of the finest sections, and the local celebrities had a number of well-shown birds; one Brown Red cockerel won both the open and county cup. The rest in this class were of fair quality. Black Red cocks were good in style and colour, but the first-prize cockerel was minus one toe nail, and the second was a cock without a spur. This variety is sadly neglected, although among the most beautiful of *Game*. Red hens were very good; the winners were all Brown Reds, not one good Black Red being shown. Cocks, any other variety, comprised some good coloured Duckwings, notably that which was first, the second being of high quality and colour, but they were not in the best feather. In hens an almost perfect Pile pullet was first, and a Duckwing hen second. *Hamburgs* were not numerous; in fact, there was not one entry of Silver-pencilled. The Gold-spangled were very good, especially the cup pen. Gold-pencilled were poor, while the Silver-spangled and Blacks were good. Of *Malays* there was a grand display, old and young being shown in one class. They were all Reds, except one pair of Whites to which the first prize and cup were awarded. Second came a stylish pair of Dark Red chickens. Most of the lighter colour were white in tail and red on the margin of the breasts. The *Spanish* winners were good, but the rest poor, and *French Fowls* were only of moderate quality. There were two Selling classes containing eighty-four birds, many of which were of the highest quality considering the restricted prices.

Red *Game Bantams* were poor, except about half a dozen birds, comprising the winners and one Brown Red cockerel shown by Mr. Pearson, of Wymondham. Other kinds of *Game Bantams* were Piles first and Bantam cup, and the second-prize Duckwings. In the Variety class of Bantams were many good pens, and the prizes were awarded in duplicate.

*Ducks*, *Aylesbury* or *Rouen*, were only of moderate quality, but the other varieties were good.

*Turkeys* and *Geese* were large and well shown, and mostly county birds.

*Rabbits* were next on the list, the Lop-ears showing high quality. The cup went to a grand Tortoiseshell doe; second came a Blue-and-white, and an excellent Sooty Fawn was very highly commended. Rabbits of any other variety were—first Silver-Grey, second Dutch, and third Himalayan.

The list for *Pigeons* was somewhat limited, but there were some good birds. Carriers were only moderately good, but there were some very good Pouters, both winners being White, and the cup for the first three classes was awarded to the former. Barbs were only young, and not well developed. In Tumblers, Bald, the first were very pretty Blue Short-faces, and the second a very clean-cut high-coloured pair of Black Long-faces. Some capital pens received high commendations. In Beards the winners were small and neat, and the first-prize birds took the cup for this section. Tumblers, any other kind, were Almonds of high quality in both head and feather points. Fantails were good, but mostly quite crushed in feather, a fault not easily surmounted with birds often in the basket and show pen. Dragons were a good class; a Blue cock was first, and a Red second. Antwipers were not numerous; the first was a Silver Dun Short-face, second a Long-faced Blue Chequer. The Any other variety class contained nothing striking, but in the Selling class were some good birds.

*Canaries* were not numerous, but there were birds fit for any competition, the prizes going generally to the new Derby tone of colour.

The only drawback to the progress of the shows in the counties of Norfolk and Suffolk is the excessive railway charges, but with a proper representation made by the combined societies this difficulty would no doubt be easily got over. The awards were published last week.

### PEKIN DUCKS.

THESE Ducks elicited so many inquiries at the late exhibition of the Connecticut State Poultry Society, that all poultry fanciers and farmers who have good facilities for raising waterfowl will

be interested to know something more about their good qualities and history. They were brought to this country from Peking by Mr. James E. Palmer, of Storington, and landed in New York on the 11th day of March, 1873. Quite a large number were put on board the ship, but most of them died during the passage. Mr. Palmer succeeded in getting one drake and three Ducks to his farm alive, but, of course, dwarfed by the long voyage. His attention was first called to them in China by their large size. He at first supposed they were a small breed of *Geese*. They recovered their flesh sooner than he expected, and before he had suspected them of laying he found a lot of their eggs in a small brook running through the pasture where they were confined. The Ducks laid constantly until the last of July, something over one hundred eggs each. Some of the eggs were sold, given away to friends, and set under hens. About fifty birds were raised. The eggs hatch in twenty-five days, and the young birds are about one-third larger than the *Rouens* when they first come out of the shell, and they grow more rapidly through the season. Mr. Palmer's largest pair at the Exhibition, only five months old weighed 15 lbs. without any fattening or special preparation.

They are clear white, with a yellowish tinge to the under part of the feathers, which are very thick and downy. The wing primaries, and all of the flight feathers are remarkably short, showing that they have long been domesticated, and are not disposed to fly much. They are very hardy, not minding snow or rain, are easily kept in small enclosures, and only require a little clean water and regular feeding to raise them successfully. Where they have a good run they are excellent foragers, and will take care of themselves as readily as any other breed of Ducks. They have large yellow bills and reddish legs. Their long graceful necks, their white plumage and remarkable size, make them pleasing objects upon the water or about the farm-yard and lawn.

They have excited a great deal of interest among all poultry fanciers who have seen them at Mr. Palmer's farm, and were the leading feature of the State Exhibition.

The *Hartford Courant*, in its notice of the Show, says: "The most interesting event of the Show, and of the year in poultry matters, is the importation, by Mr. J. E. Palmer, of a new variety of Ducks, previously unknown in England or America. They are as much larger than the common kind of Ducks as the *Cochins* or *Brahmas* are larger than ordinary fowls."

A pair of the old birds, and four pairs of their offspring, were on exhibition. The importance of this new acquisition to our list of waterfowl will be felt by all farmers as well as fanciers. If they do for our Ducks what the *Asiaties* have done for our hens, it will indeed be a great acquisition for the whole country. —W. CLIFT, *Mystic Bridge, Connecticut*.—(Canada Farmer.)

### POLYGAMY IN PIGEONS.

I REMEMBER reading in your pages some few months since a correspondence on the above subject between "R. W." and "WILTSHIRE RECTOR," and as additional information, beg to send the following.

I have at the present time one Blue Fantail cock paired to two hens—viz., a Blue Fan and a Turbit hen; both hens have eggs, two each, laid in the same nest, or perhaps it would be more exact to say in one nest compartment, the nest-pans having been removed. This is the second time the same three birds have been in the same circumstances. The previous time they did not hatch, though, I believe, entirely owing to one of the birds being away several times at exhibitions, otherwise, I have not the slightest doubt, they would, as I have never seen the nest without two birds sitting, though I have also noticed that the cock bird will sit at different times on each or either pair of eggs, whichever may be vacated.

The Blue Fan cock was first paired to the Blue Fan hen, but requiring her to show, her faithless mate during her absence "took a fly with another," and the poor Blue hen came back to find her nest occupied by another. As you may imagine matters were lively for a short time, but now the hens sit side by side quite peacefully. Should the reverend gentleman doubt the accuracy of my observations, I can only add—*ONUS PROBANDI*.

### RABBIT FEEDING.

FIRST, as to times of feeding. Some English fanciers advocate feeding three times a day; but I find twice sufficient. The first feed is given about six o'clock a.m. in summer, and about half-past seven in winter. This usually consists of wheat, buckwheat, or barley, with the addition of a small piece of turnip or carrot about the size of a small hen's egg. In summer, when clover or other green food is obtainable, a small handful of that is given instead of the roots. In feeding with the above grains, I alternate them; this gives the Rabbits a better relish for their food.

The night feed, which is given about six o'clock, is always

oats, with a handful of cut hay (clover if to be had), and when green food is scarce a small piece of carrot or turnip. If I can get fresh clover I dispense with both hay and roots. In using green food never give it while wet. My custom is to cut it and let it wilt before using; cut it when dry, and keep one day's supply ahead. Occasionally I give for the morning feed whole Indian corn; in the winter or in cold weather coarse Indian meal stirred into scalding hot milk, and covered closely for half an hour until it is steamed through; this mess must not be soft or masby, but crumbly. Peas soaked a few hours, and then drained, make another good change for the morning food; once a-month, or oftener, a little linseed oil cake may be given with the Indian meal, but it should be quite sparingly used. Vegetables I use very little of, and only after being somewhat wilted. Lettuce is too cold and wet. Cabbage is somewhat better. In their season beet and carrot tops and pea haulms help along the bill of fare; but all these greens are only given as relishes, and that with a sparing hand. The too free use of very green or wet vegetable food will be certain to produce the most disastrous results: Pot-belly, dropsy, and other diseases are sure to follow. Dandelion tops are greedily devoured, and are a most excellent feed. This is an almost certain cure of the disease known as red water, and is an excellent corrective of other ills. Plantain leaves are also a safe and good feed if not used to excess. Potatoes roasted dry are also esteemed a most wholesome feed. All kinds of meal—oatmeal, barleymeal, and middlings are used by English fanciers, and recommended.

An English writer, quoted by Bement in his work published twenty years ago, says that the words "dry food" "should be printed in large letters, and placed in a prominent position in every rabbitry." In the observance of the teaching of these two words lies the key to success in this fancy. No matter what the provender consists of, always give a preponderance of dry food.

Some writers have recommended keeping a cup of water where the Rabbits can have free access to it; but this I cannot endorse. In extremely hot summer days I have given each animal a few spoonfuls of water morning and night; and my breeding does are given perhaps half a gill of water or milk for two or three days before and after kindling. I prefer to give milk when it can be had, as it is nourishing as well as thirst-quenching. At other times I never allow them to have water. A very little salt once a-week mixed with their feed is beneficial.

For condiments to tempt the appetite I use fennel, sweet marjoram, parsley, aniseed, chicory, and tea leaves dried; but these also should be used in small quantities, and more as a tonic than as a regular diet.

I thing I had nearly omitted the importance of removing all grain or food from the feed cups before putting in a fresh supply. After having breathed on the feed and nosed it over, the Rabbit, who is a dainty animal, will not eat it unless compelled to by hunger. A very little attention will soon learn the amateur how much each of his pets will consume, and he can regulate the feed so that none or scarcely any will be left. The feed cups should be often washed, for cleanliness is one of the indispensable adjuncts to success. The same cup or vessel should not be used for both wet and dry feed, unless thoroughly cleaned and dried after being used for the former.

Does with young should be more liberally fed, and with more nourishing diet than others. A slice of bread dipped in milk is a dainty treat for them, as well as being very nutritious. The amateur will find, however, that Rabbits, as well as himself, have their likes and dislikes, and while one will greedily devour some kind of provender, another will refuse to touch it. In such cases better humour the tastes of the animal rather than risk loss of flesh and sickness in trying to force upon it a distasteful dish.

To sum-up, my rules for feeding are: 1st, Dry food mainly; 2nd, Frequent change of diet; 3rd, Regularity in feeding; 4th, Cleanliness.—A. M. HALSTED.—(*Pet-Stock Bulletin*.)

### HONEY AND BEES AT SHOWS.

I ADMIRE the straightforward and thoroughly honest way in which your valuable contributor "B. & W." has put his views about shows; but I think if these views prevail, the day of shows will fast pass away.

I trust my last letter did not convey the idea that trickery "was perfectly understood" to be resorted to. What I intended was that the extraordinary things exhibited had been obtained by extraordinary means, and that it was "perfectly understood" that it was so; and I trust that neither my voice nor pen will ever be used to say one word in favour of "cheating or dishonesty," much less to defend it.

The point is, Is a show of necessity demoralising? I think it is not. Cannot an article be what it is represented to be, and be represented as what it really is? Where, then, is the harm?—no one is cheated or deceived. I would advise a rule to be made for all shows, and in the most stringent manner possible, that any article placed for exhibition being misrepresented, whatever that article might be, it should be forfeited to the committee;

that the exhibitor should for ever be debarred from exhibiting again, and that the case should be published in the report.

I never have exhibited anything myself, but had intended to do so at the Manchester Show, and should have so done, but for a mishap a few days before the time; and here is a case in point. A schedule of prizes was sent me, and I resolved to try in class A. I purchased a 20-inch straw hive. I placed a piece of guide-comb in it about 3 inches square, and six cross sticks, and on the 29th of May I put a good swarm of bees in it; and I venture to say that no one would have been better pleased than myself if my singing workers had accomplished the task I had set out for them without any further trouble or artificial aid. But the weather was against them, there being scarcely two fine days together; so I fed with syrup to promote comb-building, still hoping the good time was coming when the cells, so beautifully constructed, would be filled with honey. I united a small swarm to it on the 16th of June, and another on the 19th, when I placed an eke underneath 5 inches deep, for the hive (20 inches by 12) was nearly full of combs. (As the weather continued unfavourable, I commenced giving honey instead of syrup.) The bees increased in numbers amazingly, and commenced clustering outside, although my hive was 20 by 17. On the 3rd of July I gave them another 5-inch eke, and discontinued regular feeding, only giving them food now and then when there were several consecutive wet days, depending upon the weather in August; but in that I was disappointed by the same cause—bad weather. August 6th I artificially swarmed the hive, so that it might be free from brood when taken to the Show. August 12th it weighed 148 lbs. gross, and I took it about three miles from here to the moors. On the 16th I weighed it again, and it had lost 8 lbs. On the 20th I weighed it again, and it had regained 6 lbs; but as it only wanted a fortnight to the Show, I brought it home, and resolved to give it what honey it would take for a week, and from the Friday night until the Thursday following it took nearly 80 lbs. On the Thursday at noon I was going to take off the bottom eke, as it was not quite full of comb, when I had the misfortune to break some of the combs, and afraid I could not make it look nice, concluded not to exhibit it.

Now, all this was not done in a corner, for everything was open and aboveboard. I explained to everyone who came to my garden what I was doing, how I was doing, and what I was doing it for; and had the hive gone to Manchester it would have been as truthfully represented there. Am I to any extent demoralised by this performance? I think not. But if it had been done with an intention to deceive either the Committee or the public, I would denounce it as vigorously and as unhesitatingly as "B. & W." So I come to this conclusion: That if we are to have shows, there must be something really grand to look at, otherwise visitors will not come; but it need not be at the expense of "reality and truth." Let there be a properly-defined schedule of prizes, require truthful representation, and then we need not fear the result.—T. BAGSHAW, *Longnor, near Buxton*.

### EDUCATING PARROTS.

OF all the feathered pets, Parrots best repay the time and trouble bestowed on them. They can be taught to imitate the human voice perfectly, and when properly educated can repeat phrases, and even long sentences.

The Mexican, or yellow-headed Parrot, is the best talker, while the grey or African is most celebrated as a whistler, though nearly all varieties are susceptible of some instruction. In selecting a bird for education, it is important that it should be young and healthy. Treat it gently until it becomes accustomed to your voice and handling. When the bird receives lessons let it be in a dark room, where no other sounds can be heard but the voice repeating very distinctly over and over again the words to be learned.

As soon as the bird makes any attempt at imitation it should be rewarded with a nut, some fruit, or a piece of sugar, of all of which it is very fond. The teacher must not be discouraged if several weeks elapse before his efforts are rewarded. Parrots learn slowly at first, and should be taught to pronounce two words distinctly before receiving a second lesson. After being taught several phrases in this way they catch words and even sentences themselves. It is said they never forget anything once learned.

Strict attention should be paid to the cleanliness of the cage, and a plentiful supply of fresh sand provided every day. Their food should consist principally of stale bread dipped in water, squeezed dry, and a little milk poured over it. They are fond of nuts, raisins, and all kinds of sweet fruits. A few hempseed may be given occasionally with advantage. They eat vegetables of all kinds, and drink coffee. Animal food should be avoided, as it injures the plumage.—(*Pet-Stock Bulletin*.)

### OUR LETTER BOX.

BOOKS (Mrs. Walsh).—The price of Wright's "The Brahma Fowl" is 5s Any bookseller can obtain it for you.

**CUPS FOR GAME FOWLS (Cheshire).**—As there is a cup for the best Game cockerel your cockerel must be shown in that class, and not in the class where there is a cup for the best Game cock. The words "any age" make no difference.

**TIME OF FERTILISING (J. C. C.).**—You may set the eggs certainly at the end of a week. We should expect them to be fertile at the end of four days.

**HEENS EGG-DROPPERS (An Amateur).**—There is nothing the matter with your house or treatment except giving the buckwheat. Discontinue it, it is too fattening. Give two feeds of meal and one of whole corn. Give barley instead of wheat. If, as we gather, your perch is within 18 inches of the ground you have not the least need of a hen-ladder. The birds will hop up and down. The only way to cure the pullet of her bad habits is to remove the perches for a time. The fowls will not suffer from it.

**HATCH FROM A SITTING OF EGGS (Picatus).**—At any season of the year it is a fair average, and one with which we should be content, to hatch half a sitting of eggs. This year from our first sitting of nine we have five chickens; our two next were eleven each, and we have eight and nine from them. We hold to the opinion that in the early season a cock should have few (say five) hens with him. At present we are running ten hens to a cock. The buyer in your case has no claim whatever to another sitting. He has already hatched five, and has no right to expect as many now as he would in April.

**BENOS-AYREAN DUCKS (Julius).**—They would be quite as successful if you bred them good. There is far more difference in Benos-Ayrean than in Carolina or Mandarin. The former breed well, and belong to the class of useful birds—the latter are purely "fancy birds." There are few shows where Benos-Ayrean can show in the variety class—they mostly have a class of their own.

**FOWLS FOR TABLE (Subscriber).**—We do not like crosses as a rule, but if there is one that is bearable it is that between the Brahma pullet and Dorking cock. It makes a good table fowl. We hardly understand that eternal craving for a non-sitter of a sitting breed, or for increasing the number of eggs Nature has allotted to a hen. No rule of Nature can be evaded or interfered with with impunity. You may mix sitters and non-sitters, you may make the Brahma lay rather more eggs, but she will be a restless and bad sitter. If you want table fowls you should have Dorkings, or Dorking and Brahma mixed, and they should have your best run. You will not, however, breed prize birds from parents closely confined, however good they may be. You must so arrange your walks or pens and runs as to allow both sets the use of the three acres. Our division would be to give the Dorkings two-thirds of the day, and the Brahmas one-third. It is seldom a stable is a good place, unless the flooring be covered some inches deep with sand, gravel, or earth. Stone, wood, brick, or clinkers are all bad for fowls to roost on, or to be shunt up on.

**MANAGEMENT OF PIGEONS (Young Beginner).**—We cannot think of any safe plan for you to let your pair of Pigeons walk in your garden and yet not fly. If you cut their wings (a bad plan always) they would, in their loft, get falls and break a leg or bruise their breastbones. You might perhaps tie the long feathers of one wing, but we do not recommend it. If you make a little place of cheap galvanised iron wire for them out of doors, and carried there to it now and then, that might do, but if the hen were about laying you might lose an egg. As you really are a young beginner we advise you to send to our office for a copy of Brent's "Pigeon Book," free for nineteen stamps, and study its pages earnestly.

**CANARIES' EYES AFFECTED (E. L. P.).**—I have never met with such a case before. Do you think it can arise from cold, or does the affection appear chronic? As you have two birds suffering from the same complaint I should be inclined to think it is some form of infectious ophthalmia; and yet it does not seem to affect the general health of the birds. You can do no harm by bathing the eye with warm water. Hold the bird firmly but lightly, and bathe the eye with a sponge, or pour the water on from a spoon. You need not be afraid of drowning the patient, and must not be surprised at the former appearance it will present when well soaked, for it will be next to impossible to confine the bathing to the spot affected. The bird will soon dry itself if placed near the fire, and will look all the better for the operation.—W. A. BLAKSTON.

**CANARY DYING SUDDENLY—GOLDFINCH FOR BREEDING (J. G. Webber).**—The bird must have died from epilepsy or apoplexy, or—something else. In the absence of other evidence to lay before the jury I must suggest a verdict of "Died from natural causes." A fresh-caught Goldfinch ought to be ready for pairing about the end of May, or a little earlier.—W. A. BLAKSTON.

**FEEDING FOR HIGH COLOUR IN CANARIES (Ally Sloper and others).**—I have been inundated with inquiries respecting this matter, and it is interesting to trace the under-current of feeling which pervades many of the communications. Many seem to doubt the potency of the simple recipe, and others, thinking something else lies hid, want to discover the little secret in a most disinterested sort of fashion. However, to all whom it may concern, to one hard-boiled egg and an equal bulk of bread crumbs or crushed biscuit, and to this add the Cayenne pepper. How much? A teaspoonful! You may begin with less, but the quantity they will eat must be seen to be believed. This I say advisedly, for those who will not believe Mr. Bemrose's *ipse dixit* will believe nothing till they see it—and many not even then. This mixture must be given daily, in addition to the ordinary seed, and must be begun while the blood is in circulation in the young feather—i.e., immediately before and during the moult.—W. A. BLAKSTON.

**POINTS OF A CRESTED CANARY (Highfield and Beginner).**—I will endeavour to illustrate the points of a Crested Canary by a sketch in a future issue.—W. A. BLAKSTON.

**BEE MANAGEMENT (Live and Learn—Goldstone).**—You are in a locality which is excellent for bees, and there by a little attention and perseverance you will soon manage them with advantage both to yourself and the cottagers around you. You have not acted wisely in keeping the bees in their hive during the late mild weather. The sooner you open the door the better it will be for the bees. When snow is on the ground bees should be kept within their hives. You will do well to feed your bees in March three times a week. About half a pound of sugar mixed with half a pint of pure water will make three feeds for them. In April the quantity may be either increased or the food may be given more frequently. If your hive is a strong and healthy one it will require supering at the beginning of May. By turning up your hive you may cut guide comb enough out of it, without much injury, for your supers or swarm hives during this year. Doubtless guide comb and supers may be readily obtained from dealers, but we cannot recommend one in preference to another. Consult our advertising columns from time to time.

**BEES IN SUPERS (Scybor).**—Your case is not singular as respects the bees taking possession of the supers. We are in the same predicament with three

of our hives, and are somewhat puzzled how to treat them. The stock hives below were no doubt utterly destitute of food when late autumn came, and the sensible creatures preferred to ascend to the attics, where they had stored their early summer supplies, rather than give themselves the unnecessary labour of carrying it below. If your supers are tolerably large, you might remove the stock hives now and reserve them for the time when the bees wanted room. They would then immediately take to them, and thither the queens would speedily descend and the supers become *bona fide* supers again. This is what we are inclined to do, if we do not let well alone and leave the bees to their own devices. The only gain to the bees that we can see in adopting the former course would be the saving to them of labour in passing in and out from the open air. Of course the beauty of the honeycomb in the supers will be spoilt, but better this than risking the loss of young brood already in course of rearing, and the sacrifice of many valuable bees in any process of translation at this season of the year.

**AGED STOCK HIVES (Idem).**—We think it better after eight or ten years to transfer bees to a new hive and destroy the old and blackened comb. No doubt there are instances where bees have thriven in much older hives, but in how many instances has there been failure? The proper time for doing this is after the issue of the first swarm, before the young queen's eggs have been largely hatched, say about a fortnight after the issue of the swarm. Put this in the old hive's place, which will tend to increase the young population in the latter and prevent its swarming a second time.

**HIVES (J. A. G.).**—Several makers advertise in our columns, and supply bees also. Write to them, and ascertain which can best meet your wishes.

**SUGAR (W. J. C.).**—Any wholesale grocer would supply you.

#### REMARKS.

- 4th.—Rather frosty, but a fine pleasant day.  
5th.—Foggy and dark in the morning, and so continued all day.  
6th.—Fog in the morning; much brighter about noon, but still foggy, at times very dense.  
7th.—Fog with white frost in morning; very fine day; the frost gone by noon and much warmer.  
8th.—Fine early, and occasionally so all day; small snowballs or "grape" falling between 3 and 4 p.m.  
9th.—A very fine, bright, cold winter's day.  
10th.—Slight snow between 5.30 and 7 A.M., from which time it was a fine frosty day.  
The mean temperature at 9 A.M. 10° below that of the previous week; dense fog at times, but some nice bright winter weather.—G. J. SYMONS.

#### COVENT GARDEN MARKET.—FEBRUARY 11.

We have but little alteration to report here, the markets generally being very quiet. The supply, however, is quite sufficient for all requirements, the prices being rather below the average of former years. A large quantity of Potatoes is offered at the depots and watside premises, the bulk being in very fair condition.

From observations taken near London during forty-three years, the average day temperature of the week is 46.6°; and its night temperature 31.8°. The greatest heat was 62°, on the 25th, 1865; and the lowest cold 10° on the 21st, 1855. The greatest fall of rain was 0.92 inch.

## MY SEED ORDERS—A RETROSPECT.—No. 2.

MY term of responsibility arrived. I am sure it toned down my criticism on the practice of a veteran who, I had thought, was so far behind modern times and requirements. I thought of the never-failing supply of vegetables in season, and the satisfaction they must have given, a complaint being never thought about. His advice, which had become a proverb, and which, I fear, was once deemed obsolete, or made up of an old man's prejudice, came sounding in my ears, and like the lingering refrain of a tune that haunts the memory, it would not be shaken off. "A few things and good to depend on, and of these a strong lot," I began to think might be sound doctrine; it might be the outcome of half a century of practice, and not the mere dictate of octogenarian prejudice. It shook my youthful infallibility, and I sought advice; but where? In the very place where most young men mistakingly fly to—viz., a "clever young fellow." The world is full of them; we meet them everywhere; their confidence is alluring, and their assurance and address fascinating. They are fully abreast of the times, if not a march in advance. They must know better than the "old school." If you ask them a question you get an answer. They cannot afford to admit their ignorance, it would be derogatory to their reputation and standing. They wear spectacles of enthusiasm, and are ever making "discoveries." These are the men to give advice. This is their great forte. Asked or unasked it is all the same; they are full of notions and opinions—inspirations of genius—and being philosophers too, the world must have the benefit of their knowledge. Ask them, Do they ever contribute to garden literature? and you soon find they "don't care for papers;" have been "wanted to, but have declined." When they were at so-and-so they took all the best prizes for this and that, and the gardener got all the credit and reward—they, of course, growing the things; he, poor old man, knowing very little about it. It was such a one as this who upset my convictions inherited as the legacy of my old friend; and now I will upset his theoretical fancies, and his mythical skill shall fade away when tried against quiet, unobtrusive, and long-won experience.

We took the catalogues, and stopped first at Beet. The one sort that had given such satisfaction for years past was almost, but not quite, left out, and four other varieties distributed over the allotted Beet ground. One of the new ones was fortunately the same as the old one, or a Beet famine was inevitable, the others by shape, taste, or colour not being liked. What advantage then, suggests common sense, in growing half a dozen sorts when that which pleases the best is known? Why not occupy the ground with it alone, and have an abundance? From that day to this it has been done, and year by year not a complaint is whispered. The old man was right, the young one wrong. Beets and palates vary, and better than quoting an individual sort by name

it is more sensible advice to say, Prove the kind most liked in your individual case, and whatever others are grown keep to the best in the main, and have sufficient of it alone for all demands; then you are safe, and may still enjoy variety, if ground is plentiful, by limited trials of other kinds.

We next come to Cabbage—one of the most important crops if early. Earliness is a supreme condition, affecting its value, as all know who have had to wait for Cabbages "turning-in" after the Winter Greens would no longer fill the vegetable basket. In my order eight sorts were marked and grown; but never again shall my trust be put in catalogue descriptions of this standard vegetable. There are far too many in the market to bewilder and disappoint. But for a sowing, amongst the rest, of a little seed of my old chief's saving the place would have been cabbageless in Cabbage time, and I do not like to think what would have been the result. I have tried, I may say, scores of varieties, or rather scores of names, in my time, and have come to the conclusion that strains are now more numerous, but less distinct and pure, than they were thirty years ago. And the worst of it is, if you order a given kind at three different places it is more than possible you will get at least two varieties, perhaps three, but it is almost impossible to obtain the same one sort ordered from all. The Cabbage seed trade is out of gear. The array of names and aliases is too great to keep in order. The individual is lost in the multitude. There are, no doubt, good early sorts, but the difficulty is to know where to send and what to send for with security. I will say no more than that with three sorts I am never scarce; I used to do it with two, but I have added Cocoa-nut to the true Atkins' Matchless and Early York. The old man's practice and his one sort again put to confusion the young man's eloquence on the eight "splendid new varieties."

Cauliflowers are like Spanish grandees—a good many names attaching to one individual. In youthful ardour I tried all, and no harm came by it, but in the course of years have come down to my old friend's number. I can nearly do everything required with one—Walcheren, and quite when I add to it a first-rate type of Early Erfurt. With these two and Broccoli I can cut heads of first-table quality every day in the year, the first Broccoli, Snow's, promptly following the last Cauliflower, Walcheren, in January; and the first Cauliflower, Erfurt or Dwarf Mammoth, following as promptly the last Broccoli, Cattell's Eclipse, in June. That does all that is needed. But before leaving Cauliflowers I must say that for giving away or exhibiting, and small ones for home use, Veitch's fine introduction, Autumn Giant, has won a permanent place. But what is to be said on the other mighty host of Broccoli? Of numbers under different names I will venture to say that they are so much alike that you cannot tell "either from which." Most, however, are good; Adams' Early, Dilcock's Bride, and Wilcoxe, with the two above named, give me an un-failing succession, and are of more real use than I found double the number of sorts in my earlier days.

Onions, which were once a source of anxiety to me as to ordering the best, were only got over by my clever young adviser voting this and that indispensable, until we embraced all in "large type," and now, like my old tutor, they have gradually come down to two. With James's Keeping and White Tripoli I never know what it is to be short of Onions for above five minutes at a time.

Just a word on Lettuce. Year by year odd sorts dropped out of the order, and only two remain—viz., Hardy Green and the old Black-seeded Bath Cos. Don't, young friends, cry "ridiculous," because the last requires tying. It does, but then there is no Lettuce like it for true, full flavour, solidity, and crispness; and if you have a Lettuce-connoisseur to supply, you will find that nothing will satisfy so well as this old kind if only put on the table in first-rate trim. It is not at all uncommon, indeed it is frequent, for visitors at the table to come into the garden the next morning, see the Lettuce growing that they found so good to eat, and take down its name. No more need be said, except that whatever others are grown this is the Lettuce to depend on for the main supply summer and winter. If it ever fall to my lot to describe it in a catalogue I shall say, "Still the hardiest and the best."

Need I say anything on Beans? Perhaps only to observe that Carter's Champion is an improvement on the old Scarlet Runner; and as to dwarfs, Negro for strong land, and the old Mohawk for light soils, may always be depended on to do their duty well. Common Broad Beans hardly demand a word, but in point of quality Beck's Dwarf Gem heads the list and should never be omitted. As to the larger ones, the best or the worst will neither make nor mar any man's reputation, and as there is not much danger of a wrong choice I can, with a good conscience, "leave them to chance."

I pass on to Peas. Here anxiety and perplexity once culminated. It is not so now. I have no misgivings as to what to order to "follow one another," and have no lurking fear of having to change "a word or two of a sort" with the heads of the kitchen and parlour. Mind, I am not going to say a word against the new varieties, as I know how good some of them are, but I will say this fearlessly, that by growing too few or too many sorts you spoil all. I have neither stolen nor begged experience on the point, but bought it. Had I been content to follow my safe old guide instead of putting my trust in the young one, I should never have been driven to make explanations and frame apologies in the all-important matter of Peas. Once on a time, when I thought I knew most things—and the few I had overlooked my precocious friend had duly appropriated—my seed order, of course, embraced about twenty varieties. The "row of a sort to follow another" was to gain its just triumph. Ancient prejudice was to be swept out of the garden by modern practice. The past was to be lost in the success of the present. The old system must die and the new style reign supreme. How futile! They were duly sown, the nicest possible calculations being made as to the time of each coming in to "follow one another." But they did not keep correct time—and then, what? Why, of course, we blamed the seedsman for not sending them true to name. How often it is that ignorance begets injustice! The sorts were good enough in themselves, but by having too many kinds and too few of each, we spoiled all, and in this way we were often driven to make-up a dish of two or more varieties. Young men, that we'n't do. Mix Laxton's Quality and Hundredfold, for instance—two excellent Peas in themselves—but the mixing spoils both; or two older ones, Champion of England and Prizetaker, and then—be ashamed. If I were driven to put a mixture like that on my employer's table now I should feel as if I had committed a crime; but I know better. I always have an abundance of the best, and these are just my old friend's number. Years have proved him right and my youthful genius wrong again. And what are the three—the chosen as the result of many years' actual practice? First I must say that my employers prefer to wait a week and dispense with all the early rounds, and begin with Laxton's Alpha as the first of the wrinkled Marrows. This, then, is my standard early, sown over and over again, followed by Champion of England, ditto, ditto, as still the best for the general crop; and this again succeeded, in like manner, by the fine well-proved genuine late Pea, Ne Plus Ultra. With these three I can do all that is required. They give three certainties, each indispensable—viz., certain as to quality, quantity, and time.

I need not further enumerate. I have proved the soundness of the advice of an old practical man, and can endorse it by a no inconsiderable amount of experience as, if not absolutely

the best, yet thoroughly reliable to meet everyday wants, and as satisfying alike master and servant. Just as my seed-orders have grown less in variety, just in the same proportion has success become greater, until a complaint was never heard. That is the great goal to aim at. Until it is reached gardening is a hard and wearying race; but when obtained, hard work becomes easy and servitude pleasurable. I have pointed out the rock on which I split and the way I righted. It is the one and common track of danger—a fascinating track, on which hundreds of young gardeners are allured. If they will read, consider, and trust hard-bought experience they may save themselves much trouble which undue enthusiasm may more than possibly produce. If the young think the older brethren of the craft require pushing on, certainly the old consider a word of caution salutary in holding somewhat in check the professional impetuosity of youthful friends, whom they desire to see prosper and grow into better men than themselves.

"But surely all this is very old-fashioned," some may say; "these old things must be out of date." No, they are not: they are the very sheet-anchors of the vegetable garden, and will serve it well in the future as they have done in the past. But what about the new ones? Buy them and try them. They will give a vast amount of interest and pleasure. The skill, perseverance, and enterprise which produce them demand acknowledgment. Of their comparative merits I cannot write at present, feeling my letter already too long.—OLD FRIEND.

### LONICERA FRAGRANTISSIMA AND L. STANDISHII.

We have received from Mr. George Lee, of Clevedon, specimens of *Lonicera fragrantissima*, with the following communication:—"I had it some years ago from Mr. Rivers, under the name of *Lonicera odoratissima*. I had another some years previous under the name of *Lonicera fragrantissima*, which I have since had from Mr. Cranston, of Hereford, under the name of *L. Standishii*. They are each hardy, as far as mature growth goes, but the young growth of *odoratissima* is killed by the frost. *L. fragrantissima* commences flowering in October, and continues, except in very severe frost, till April. *Odoratissima* does not begin till February or early in March as a rule; but the reason I have sent it is because I think it deserves to be much better known as a wall plant, on account of its beautiful evergreen foliage, as you will see from the two branches I have sent, as well as on account of its delicious perfume. It will grow as a shrub, but then it loses its leaves in winter if in exposed situations, but against a wall it continues green. The specimens sent are from a north wall."

According to M. Carrière, in "*Flore des Serres*," *L. fragrantissima* and *L. Standishii* are distinct; the former he describes as spreading almost horizontally with a whitish aspect, and never completely without leaves, the new ones appearing at the same time as the flowers before the fall of the old ones. *L. Standishii*, he says, is a close erect bush with numerous short branches, and with a reddish-brown or russet aspect. Its flowers are much more numerous, more conspicuous, slightly coloured, and at the time of their appearing the plant is entirely without leaves.

But M. Carrière says both bloom from January till March. Both specimens sent us are clearly *L. fragrantissima*, and that one must be a most desirable variety of this species, which, as Mr. Lee says, begins to flower in October, and continues till April.

### TSUGA TSUGA.

A CORRESPONDENT, "CONIFER," inquiring for a description of this Japanese Hemlock Spruce, justly complains of "its barbarous naming." He might also have complained of its numerous renamings. Siebold, its discoverer, called it *Pinus Araragi*, and other botanists have written of it as *Abies Tsuga*, *Pinus Tsuga*, and *Tsuga Sieboldii*. It is thus noticed by Mr. Gordon:—"The Japanese names for this Fir are *Tsuga* (Yew-leaved) and *Araragi* (Yew-like). It is much used for planting round their sacred temples on account of its graceful appearance, and a variety of it, called *Hime*, or *Fime-Tsuga* (dwarf Yew-leaved), is much cultivated in pots by the Japanese in their town gardens, the plants never growing more than a yard high under such circumstances, and with much smaller foliage."

"It is said to be a large tree, attaining 100 feet in height, at an elevation of 6,000 feet, on the sacred mountain Fusi-

Yama, near Yeddo. The Fusi-Yama is the highest mountain in Japan (14,000 feet), with dense Pine forests, chiefly composed of this kind, covering its sides to 8,000 or 9,000 feet of elevation."

The best description of this Conifer is by Mr. A. Murray in the "Proceedings of the Royal Horticultural Society," from which we extract the following. The woodcut is one of our own.

"A tree of from 20 to 25 feet high, of the habit of *Abies canadensis*, to which it is closely allied. Trunk erect, with yellowish brown timber. Branchlets with a dirty cinereous brown bark; the youngest slender, glabrous, pale brownish; pulvini angularly decurrent, thickened, and turned upwards, wholly adpressed to the branchlet; phyllulae semi-orbicular. Buds surrounded with scales, which are very numerous and imbricated; the lower scales ovate, obtuse, keeled, glabrous, coriaceous, abbreviated, persistent, but not placed remote from

*Tsuga Tsuja.*

each other; the upper (and inner) scales much longer, spatulate, obtuse, membranaceous, and deciduous. Leaves from 6 to 10 lines long, perennial, approximated, and alternate, but subdistichous from the lower leaves being more or less twisted at the base, distinctly stalked, with the stalk rather long and slender and slightly curved, linear, generally obtuse and emarginate, rarely somewhat sharp-pointed, entire, glabrous, coriaceous, above deep clear green without stomata, below keeled, with a midrib, on each side of which is a white line of from seven to ten stomata. Male catkins growing in the axillae of the branchlets of the preceding year, scattered, solitary, encircled with scales; the scales more numerous than in the leaf-bearing buds, closely imbricated, in other respects conformable to them; the catkins themselves cylindrical, stipitate, with a straight stiff slender cylindrical stalk, longer than the scales. Stamens numerous, at first closely imbricate, afterwards somewhat looser, spreading out horizontally, rather long; the filaments filiform, dilated at the apex into a scale, or a small spatulate obtuse entire coriaceous connective appendix, from the base of which descend two divergent elliptical longitudinally bivalve loculi. Female catkins solitary, terminal on the branchlets of the preceding year, at first enclosed in scales as much as the male catkins, afterwards emerging on a short footstalk, to whose base the scales are persistent. Cones ripen the first autumn, small, not an inch in length, sub-elliptical, narrowest at the apex, remaining on the tree after the fall of the seeds. Scales (a in cut), inside, with seeds, about thirty in number, imbricated, coriaceous, glabrous on the outside where exposed, tomentose inside and where covered on the outside by the neighbouring scales, and

somewhat shining pale brown, nearly orbicular, deeply emarginate and stipitate at the base, slightly emarginate at the apex; margins entire, substriated where exposed. Bracts short, rather broad, closely adpressed, bifid or bilobed from the midrib, not extending so far as its wings on each side. Seeds small, ovato-rhomboidal, inequilateral, somewhat compressed, with depressed spots of various size on the test, and with globules of resin shining through the skin; the wing pale, ferruginous, membranaceous, straight behind, abruptly expanded from the seed in front, thence obliquely directed to the apex, which is sub-truncate, nearly a third shorter than the scale."

## POTATOES.

THE value of this crop and the interest excited about it must be my apology for having a few more words on the subject. I have given my own experience, and have nothing further to add on that score; but I am anxious to ask my former neighbour and friend Mr. Luckhurst whether he considers it desirable to lift the crop when the skins rub. I have always understood that there was danger as to their keeping if they were in this state. My Victorias last year were green in the haulm and the crop large; and I intended to lift them early in August, but found that the coats rubbed so easily that I was afraid to do it, and left them a while longer, and the result was a terribly diseased crop. I am now (February 14th), planting my entire stock, and hope to have all finished by next week, thus expecting to have an early ripened crop; but on this point, as to the rubbing of the skin, I should be glad to be informed.

I am afraid your correspondent "J. P." will challenge my sanity if I venture to express a doubt as to the decisions at Chiswick with regard to Potatoes, but for practical purposes I hold that those trials are not sufficient. What ought to be done is to have the Potatoes sent in, and from those grown there a trial to be made the second year. I have long felt that the place whence our seed came made a good deal of difference in the crop; and hence there ought to be, to ensure a fair comparison, a trial from Potatoes all grown on the same kind of soil and in the same locality. I feel this the more because I cannot understand the praise given to the American varieties. Either they are entirely different to what I have ever found them, or else the ideas at Chiswick as to what constitutes a good Potato are very different from mine. There is not one of them that I have seen that I would give garden room to. They are, it is true, large croppers, and some of them fine-looking both in haulm and tuber; but they are very subject to disease, and like Paddy's horse, which was "a mortal bother to catch, and when he was caught wasn't worth the bother."—D., Deal.

## A GOOD FIG.

THE other day I heard a Spanish proverb, that a good Fig should have "the eye of a widow, and the cloak of a beggar." The tattered covering through which the flesh is seen is a good proof of excellence, and the weeping eye is desirable; but there are first-rate sorts, as the Coldi Signora Nera, whose eye is not moist, while White Marseilles, an inferior sort, drips in the most approved manner.—G. S.

## DESTROYING GREEN FLY.

ON going into my Cucumber house one morning last week I found some Strawberry plants covered with green fly and red spider. I called to mind what I had seen in "our Journal" about the ammonia in guano being fatal to insect life, and determined to try the effects of some liquor made up of chamber wash, soapsuds, and dish-washings, knowing that the said liquor was highly charged with ammonia. About two gallons were put into an old iron bucket, and made so hot that I could barely handle the syringe, through which the hot fluid was given a good soaking, thereby filling the house entirely with steam. The morning after there was not a live insect in the whole house, and all the plants, Cucumbers as well, are looking much better for their bath.—WILLIAM OSBALDISTON, Fulwood.

SALE OF ORCHIDS AND TREE FERNS.—Mr. J. C. Stevens had a sale of Orchids and tree Ferns on the 6th inst. Of the Orchids, *Oncidium zebrinum* sold for £1 8s.; *Odontoglossum Hallii* for £3 10s.; *Oncidium acuminatum* and *superbium*, each £3 10s.;

*Odontoglossum coronarium*, £2. Of the tree Ferns, the highest price was £3 15s. for a *Cyathea dealbata*, having a trunk 2 feet 9 inches high. Mr. Stevens also sold on the 12th inst. five hundred lots of Orchids, realising about £700. *Dendrobium Jamesianum* sold at from 20s. to 50s. per lot; *Calogyne* (Pleione) *Reichenbachiana*, from 30s. to 57s. 6d.; *Saccolabium Blumei majus*, a strong plant, 52s. 6d.; two of *Odontoglossum Roezlii*, five guineas; and *Saccolabium premorsum* for 65s.

## ROYAL HORTICULTURAL SOCIETY.

FEBRUARY 18TH.

At the January meeting scarcely anything was exhibited; at this, on the contrary, there was an excellent display. Novelties were fairly represented, of older plants several beautiful specimens, and of mixed groups no lack, and among these Orchids reigned paramount, while the brilliant colours of the Cyclamens and Camellias lent a glow to the whole.

**FRUIT COMMITTEE.**—Alfred Smea, Esq., F.R.S., in the chair. A collection of Variegated Greens was exhibited by Messrs. Stuart & Mein, of Kelso. They are the same as have been before the Committee for several years past. Mr. Clayton, gardener, Grimston Park, sent a box of the "Grimston Park variety of Lion House" Cucumber, which does not differ from the original variety. Mr. Bennett, gardener to the Marquis of Salisbury, at Hatfield, sent tubers of a handsome seedling Potato raised from the American Early Rose, and it was recommended to be grown in the garden of the Society.

Mr. Horley, Toddington, Beds, sent a seedling Apple, and one was also received from Mr. J. Wermington, Neeton Lane, Guilsborough, both of which were considered inferior varieties. Mr. Bennett, The Gardens, Hatfield, sent a dish of Lowndes's Pippin—a good-sized cooking Apple, and also a dish of Winter Bon Chretien and Uvedale's St. Germain Pears.

Mr. Jones, The Royal Gardens, Frogmore, sent three very handsome fruits of Smooth-leaved Cayenne l'ineas, which were awarded a cultural commendation.

Messrs. James Carter & Co., Holborn, sent ten dishes of Potatoes, among which were New Snowflake—a newly-imported variety not yet in commerce, and Peach Blow, Carter's Main Crop, Early Rose, Late Rose, Extra Early Vermont, Vermont Beauty, Gleeson's Late, Compton's Surprise, and Red-skinned Flourball, for which the Committee awarded a letter of thanks to Messrs. Carter.

**FLORAL COMMITTEE.**—W. B. Kellock, Esq., in the chair. A very good collection of Orchids, Cyclamens, Amaryllids, and other plants was sent by Messrs. Veitch, Royal Exotic Nursery, King's Road, Chelsea. In it were *Odontoglossum pulchellum majus*, a perfect gem, nothing could be better for wedding or other choice bouquets; *Angreum citratum*, which had a first-class certificate, forming a compact exquisite wreath of creamy-white flowers; a pure white form of *Cattleya Trianae*; *Laela filcheri*, a garden hybrid, the sepals and petals delicate blush; *Amaryllis Leopoldii*, maroon crimson centre, margined with creamy blush; and *A. Ackermannii pulcherrima*. There were also a number of seedlings of considerable promise, crosses with *Hippeastrum pardinum*. *Toxicophleas spectabilis*, a stove shrub with heads of white flowers delicately scented, received a first-class certificate. A cultural commendation was awarded Messrs. Veitch for their fine group of Cyclamens.

Mr. B. S. Williams, of Upper Holloway, also sent a collection of plants, prominent among which were the valuable winter-flowering Orchids, *Calogyne cristata*, *Odontoglossum nebulosum*; *Calanthe Turneri*, perhaps the best of the vestita section; and *Renanthera coccinea*, a very healthy specimen with a branched spike of its quaint flowers. This was awarded a cultural commendation.

Mr. C. Turner, of Slough, sent an excellent group of plants, comprising standard Aucubas, green and variegated, profusely covered with berries; and Zonal Pelargoniums very well flowered for the season. Messrs. Standish & Co., Royal Nurseries, Ascot, likewise sent a group of Azaleas, Bouvardias, Chinese Primulas, the white-flowered *Abutilon Boule de Nieve*, Lily of the Valley, &c.

Mr. W. Bull, of Chelsea, had first-class certificates for *Pleocnemia Leuzeana* with graceful glossy fronds; *Alsophila elegantissima*, another handsome Fern with wide-spreading, shining fronds; *Rajartera pandanoides*, and *Hippeastrum picturatum*, very distinct in colour, white striped with crimson. Along with these were *Alpinia vittata* with cream-variegated leaves, and *Copernicia* or *Corypha cerifera*, a very ornamental Palm.

A grand collection of cut blooms of Camellias was exhibited by Mr. W. Paul, of Waltham Cross. The most noteworthy were *Marchionessa of Exeter*, *Alba plena*, *Fimbriata*, *Elegans*, *Imbricata*, *Ulane*, *Principessa Aldorandina*, salmon flesh, peculiarly beautiful and delicate in colour; *Bealii*, very rich in colour;

*Sarah Frost*; *Jeuny Lind*, a beautiful and fine-constituted variety; and *Madame Lebois*. Mr. W. Paul also exhibited his Waltham White Chinese Primula, which had before received a well-deserved first-class certificate.

Mr. F. Perkins, of Leamington, sent Chinese Primula Prince Arthur, semi-double, rose crimson, very showy; a first-class certificate was awarded. Mr. Smith, Ealing Dean Nursery, also sent a variety of the same character, but much paler in colour, called Carmine. From Mr. R. Dean, Ealing and Bedford, came a collection of Primroses; *Viola* had a first-class certificate.

A noble specimen of the beautiful golden-and-white *Calogyne cristata*, exhibited by Mr. Child, gardener to Mrs. Torr, Garbrand Hall, Ewell, was awarded a cultural commendation; and a first-class certificate went to Mr. Mitchell, gardener to R. F. Ainsworth, Esq., Manchester, for *Dendrobium Ainsworthii*, a hybrid between *D. heterocarpum* and *D. nobile*, with flowers larger, more creamy, and with not so deep-coloured a blotch as the latter.

Mr. George Lee, of Clevedon, Somerset, offered four special prizes for two plants of his fine new Violet *Victoria Regina* (of which an engraving and description were given in vol. xxiv., pp. 265 and 266), flowering in 6-inch pots; and similar prizes for The Czar. There was hardly any competition, and none of the specimens shown were remarkable. Mr. R. Dean was first for both varieties; J. Maguire, Esq., The Hollies, Northampton, being second for *Victoria Regina*.

## CROCUS IMPERATI.

A MEET companion for the choicer species of Christmas Rose (*Helleborus*), the brave little, cold-defying, ever-flowering Violet Cress (*Ionopsisidium*), that hardiest, earliest, and most floriferous of flowering shrubs, *Rhododendron precox*, &c., is that magnificent Calabrian Crocus named by Tenore after the old Italian botanist Imperato, C. Imperati. Here is a plant, the showiest and most stately of the genus, which puts forth its beautiful and fragrant blossoms weeks and weeks before the earliest of the yellow or other spring Crocuses dare to venture theirs, beginning to flower in midwinter, and persistently continuing to bloom well into the first month of spring. In habit too, and bold appearance, it is superior to any of them, and further, is remarkable for the delicious primrose fragrance of its flowers. One of its distinguishing features, too, is that, unlike other species, the pretty dark green foliage appears long before the flowers, sets off their beauty to advantage, and enhances not a little the value of the plant for the purpose which we have immediately in view. The three outer divisions of the flower are yellowish-white, with three well-marked feathered longitudinal stripes of purple; the three inner nearly or altogether purple; the anthers are yellow, the stigmas orange and fringed. There is also a white variety of it which is very fine, but somewhat rarer than the species; it also is somewhat later in flowering. For bordering, say a tastefully-arranged circular bed of Hellebores for border lines or patches, or any other situation in the shrubbery or spring flower garden which taste or fancy may suggest, we confidently think our readers will find in the precocious, winter-defying, and beautiful Crocus Imperati, one of the choicest subjects they could take in hand, and we hope ere long to find it better known, and see it far more extensively grown than it is.—(*Irish Farmers' Gazette*.)

## NOTES AND GLEANINGS.

A curious form of CHINESE PRIMROSE has been raised in the garden of the Royal Horticultural Society at Chiswick. It is like that which we lately figured of the common Primrose, and which was called by the old florists Jack-an-apes on Horseback. The stalks produce flowers in whorls, and the bracts are so enlarged as to become foliaceous; in some cases the calyx is also foliaceous as in the Galligaskins. It is a very grotesque-looking thing.

—According to the Californian papers, ORANGE CULTURE is there taking a large development, and is becoming extremely profitable. It is estimated that as much as three thousand dollars an acre can be realised.

## ECONOMIC CONSUMPTION OF COAL.

THE Exhibition of appliances for the economic consumption of coal, which has been formed in the Peel Park, Salford, by the Society for Promoting Scientific Industry, was formally opened on the 6th inst. Mr. J. Lowthian Bell, who had been

announced to open the Exhibition, was prevented from being present, but forwarded the copy of an address which he had intended to deliver. This was read by the Secretary, Mr. Larikins. The Exhibition will remain open for some weeks, and will doubtless receive its share of public notice when the elections are occupying less attention than they are at present. The domestic stoves and ranges, and the patent and other artificial fixtures, of which there is a good selection, naturally attracted the most attention from the general public. The fire grates, kitchen ranges, and stoves of new and improved designs are particularly numerous, and especially interesting as indicating the progressive steps which are being made in effecting a reformation in the extravagant waste of fuel in domestic consumption, which Mr. Lowthian Bell very forcibly pointed out in his address. In the artificial fuels the manufacture of peat holds the prominent place, and here very important strides have of late years been made. Blocks of peat as hard and as dense as coal are exhibited, and in some cases the manufacture of this material has been carried to such perfection that the blocks admit of moderately delicate carving. Amongst the other artificial fuels, probably the most remarkable is the patent "Phoenix fuel," which is composed from the refuse of coal fires by the admixture of a patent compound fluid. The formal opening proceedings in connection with the Exhibition were followed by a conversazione in the evening, held in the Peel Park Museum. We may publish more notes on the Exhibition shortly.

### TOWN GARDENING.

I QUITE comprehend the difficulties of your lady correspondent (page 146) respecting flower gardening, &c., near a large town.

It has been my lot to have three summers' experience here, in the vicinity of Liverpool, only two miles from the Exchange, and I have reason to believe if there is one locality more than another in the United Kingdom where the culture of flowers, fruit, or vegetables is carried on under difficulties it is this. In addition to the atmosphere being charged with sulphur, and clouds of smoke constantly descending and leaving its imprint of soot upon every green leaf under glass as well as outside, we often feel the effect of a cutting west wind coming up from the Mersey with great violence; and in the early part of the summer I have seen the ground literally strewn with young green leaves cut from the trees by its influence; yet under these circumstances it would not do to leave the beauty of our flower gardens entirely to the mercy of a few annuals. Far from this. Bedding-out is carried on to a great extent almost to the heart of this great commercial town, and in many instances exceedingly well, especially at the Prince's Park and the Botanical Gardens. Of course only such of the hardiest varieties as can be relied upon are used, and these consist of a great number of the most varied and beautiful of our bedding plants.

I will enumerate a few of these for the help of those who may require it. In Scarlet Geraniums I think *Vesuvius* the best in its class; *Nosegay*, *Waltham Seedling*, and *Lady Constance Grosvenor*. In its colour, old *Christine* holds its ground; *Amy Hogg* also suits admirably. In Golden Tricolors *Sophia Dumaresque* seems more vigorous than *Mrs. Pollock*, although the latter did well with me last season; in *Silver*, *Bijou* and *Flower of Spring*. In Bronze, *Beauty of Calderdale* is preferred for our requirements. *Calceolarias*, *Aurea floribunda*, *Prince of Orange*, and *Sparkler*. To insure success with this class of plants they ought to be planted-out early, say about the end of March, weather permitting. *Verbenas*, scarlet, *Lord Raglan*, *Firefly*, and *Defiance*; white, *Mont Blanc* and *Boule de Nègre*; *Purple King* and *Celestial Blue* also do well. The main point with these is to have strong, clean, healthy plants when put out. *Ageratums*, *Imperial Dwarf* and *mexicanum*, spring-struck if possible. *Lobelias* any variety. Some of the *Nasturtiums* make a nice show, such as *King of Tom Thumbs*. The *Violas* are also very useful. With these come the following useful ornamental plants, such as the invaluable *Pyrethrum Golden Feather*, *Dactylis glomerata variegata*, *Centaurea candidissima* and *Clementi*, *Cineraria maritima*, *Stachys lanata*, *Cerastium tomentosum*, *Perilla nankinensis*, ornamental Beet, &c.; and *Iresine Lindenii* may do well in some places. All kinds of *Dahlias* do well here; they must be securely staked and constantly watched. I might greatly extend this list, but if these are treated and used properly they will worthily repay whatever trouble and expense may be incurred.

Perhaps a few words on management may be acceptable. Firstly, then, the plants must be well hardened-off before being planted. If you have them to buy, procure good strong stuff at least a fortnight beforehand; put them in a sunny sheltered place, and cover with *Shaw's tiffany* every night, also in the daytime when very cold, and be careful they do not suffer from want of water. I mention this because I have seen plants brought from the nurseries and put out the same day into the beds. How healthy and beautiful they looked, but not for long. It was evident they had been under glass till their latest moments in the nursery, and at the first blast of a wind such as I have referred to the foliage is so injured that half the season is gone before they properly recover. Next, prepare your beds, if not previously done, putting in plenty of well-decayed stable manure or leaf soil, adding a liberal quantity of sand if the soil in the beds is of a stiff nature. After planting, which should take place not before the last week in May, give a good soaking of water; and as your garden is bleak and exposed, protect with *tiffany*, not by putting it on the plants, but in such a manner as to break the wind. I would not advise you to water often, unless absolutely necessary, but just sprinkle the foliage with a fine-rosed watering pot every evening succeeding a fine day, to wash off the soot.

Respecting *Roses*, we have tried them here, and if they have lived after the most kind attention it has only been to our disgust.

Of fruit trees we have some large specimens trained to walls and otherwise, but we never expect much produce from them, and therefore are never disappointed. They appear more as monuments, reminding us upon what kind of trees their respective fruits do grow. They consist of *Pears*, *Plums*, *Apples*, &c. The only advice I can offer is, Root-prune them next November, if this has hitherto been neglected; also have the wood well thinned-out, and keep them free from American blight, &c., which I find a little troublesome. *Pears*, as a rule, do pretty well here, considering.—R. SURTEES, *Gardener, The Quinta, Prince's Park, Liverpool.*

### THE CATHERINE PEAR.

I SEND you the enclosed extract from "Notes and Queries." Can you supply an answer to a question in which I am as much interested as the querist?—NOTUS.

"CATHERINE PEAR.—Suckling, in his 'Ballad upon a Wedding,' compares the streaks of red on the lady's cheeks to those on

— "A Catherine Pear,  
The side that's next the sun;"

and in the 'Schoolmistress,' *Shenstone* speaks of the lovely dye of the Catherine Pear. Is this Pear extinct, or has it only changed its name?

"*Lavater* tells us, we instinctively expect a handsome Apple to prove toothsome; but as the least comely *Pears*, so far as my experience goes, are generally the sweetest, one might suppose the Catherine Pear's charms to have been but skin deep, and hence to have lost their hold on popular favour, were it not that *Shenstone* declares its juice to have been equal to its dye. Will some *Melibœus* afford this immortalised fruit a note?—HENRY ATTWELL, *Barnes.*"

[When *Suckling* and *Shenstone* wrote, the varieties of *Pears* were very few when the list is compared with that containing now many hundreds. The Catherine Pear is not now to be found in any nurseryman's catalogue, nor anywhere except in old orchards, and there we met with it many years ago. It was ruddy on the side exposed to the sun, and when ripe the other parts were yellow. When ripe it was mealy and insipid, and at the best the juice was sweet and flavourless. It was probably introduced during the reign of Henry VIII., and named in honour of one of his queens. *Parkinson*, in his "Paradisus," published in 1629, describes it truthfully:—"The Catherine Peare is knowne to all I thinke to be a yellow red-sided Peare of a full waterish sweete taste, and ripe with the foremost."]

### THE WEATHER.

A good observer writing from *Galashiels* says, "We have wonderful weather. I saw at the Bridge of Allan, on the 6th inst., a Thorn hedge with fully expanded leaves, *Clematis Jackmanni* coming into bloom on the wall of a dwelling house, and the Chinese *Pæony* with the flower buds showing. Pear trees are nearly in full blossom. If frost come now it will play havoc. This leads me to assure you I never was more struck with a small invention than the alarm thermometer. My

eldest son acts as my foreman. He has a common thermometer outside his bedroom window, and with our great house frost is very ticklish, and he has to be constantly watching that it does not freeze while we have no fires on. When I get one of Mr. Bryson's instruments outside his window, and say it is set to begin ringing at 36° or 38°, so as to give time to get up steam before the temperature falls to 32°, he can rest at ease, for the bell never leaves off ringing till the temperature rises above what the instrument is set for, or until it is thrown out of gear.—W. T.

### INFLUENCE OF THE DWELLING.

IN reply to a correspondent, "A DORSET INCUMBENT," we can say, from long experience, we never knew a happy cottage home that was an untidy one, and that we fully agree with the Rev. Brooke Lambert who recently wrote:—"Your first endeavour should be to make the people take a pride in their surroundings, in clean floors, tidy walls, and bright windows. Don't forget those great educators of men—flowers. And in encouraging them to grow flowers, discourage them from the delicate hothouse plants, and the Roses which will not bear smoke; and press on them Musks, Creeping Jenny, ornamental Grass, Fuchsias, and that beautiful window green the Nettle Geranium. And then try and make them see that life is not so hopeless if only they will try and save. Tell them that so long as they spend all their earnings in drink, and lay by nothing for the future, you cannot help them. But if they will only try they will always find a friend ready to help. As you go on at your work you will begin to feel a respect for them, which will make you shrink from offering them money, as you would shrink from offering it to one in your own class of life, and your relations are yet such that in the case of great need you can go to them as to a friend and say, 'Don't be ashamed to borrow of me.' And as you see them struggle you learn the difficulties of their case, learn how harshly you judged them when you set them down as all belonging to one degraded class. You will find instances of kindness which make your eyeballs sore, of heroism which make you wish that you could in your own sphere go and do likewise."

Then for "the straggling, neglected Vine" our Dorset correspondent specifies, we agree with him that making staples of

Osier twigs and thrusting them under the tiles or slates is liable to loosen them, but there is a mode of training the Vine shoots over the roof without using such staples, and it was thus described many years since in one of Mr. London's works:—"By following the undermentioned simple method the Vine may be trained easily on slating and tiling. In the winter pruning take pieces of tin 6 or 7 inches in length, the refuse of the tin-workers' shops will do, and at convenient distances turn them over the shoot intended to remain, and thrust part of the two ends (a a) between the tiles or slates. The weight of the incumbent tile or slate will be sufficient to keep the shoot in its place so as not to be disturbed by winds."

If "A DORSET INCUMBENT" induces his cottage parishioners to cultivate potted plants in their windows, and Grape Vines on their roofs, he will have gone far towards effecting his good purpose—"making his parishioners more home-loving."

THE SEASON IN THE SOUTH OF IRELAND.—I am sure that you will be surprised to hear the sort of a season we are having here in the south of Ireland. I have Pear trees (standards) in the open air in full flower, and my Apricot trees against a south wall are covered with a mass of bloom. Peas sown on the 16th of December are 3 inches high; Beans sown the same date

4 inches high. The Cherry wall is easterly, and the trees are showing their flowers.—WILLIAM RYAN, *Gardener to Mr. Early, of Donoughmore, Knocklofty, Clonmel.*

### WINTER BROCCOLI.

BROCCOLI, during the winter, is a rather precarious crop in some situations—so much so that if we were to plant a quarter of it we should probably be disappointed of a supply. There are gardens where Broccoli is almost a certainty, and, on the other hand, not a few in which after November it is the exception. Perhaps no vegetable degenerates more unless great care is taken in selection, and with early kinds there is a positive difficulty in saving the seed true. This must be apparent to all on considering what we get for early varieties such as the White Cape, Grange's Autumn, Penzance, Adams's and too often Snow's Winter White. After the great care in sowing, planting, protecting, &c., not unfrequently we have heads the size of a button Mushroom, or a big bunch of white or purplish green sprouts.

Broccoli culture in cold, wet situations, unless there be a few of the late hardy varieties, is frequently a failure. Where there is plenty of spare ground space can be allowed such precarious crops without much loss, but it is not so where every inch is absolutely required to supply the wants of the establishment. It is not new sorts that we want, but a more careful selection and saving of those we already have, and I fear that the worthless mixtures often sold are caused, in a great measure, by saving the seed of more than one variety in the same garden or field. Indeed, if within a few fields of each other, different varieties of Broccoli are sure to be cross-impregnated by bees or other insects. We need not, however, search long to find that Broccoli can be kept true and without degeneration. See what is done at Penzance and in its neighbourhood. Who has not seen the Cornish Broccoli and not wondered at its size and snowy whiteness? Yet it has been grown in that county for years without change of seed or soil.

If, again, we wanted proof that every Broccoli can be kept pure, we have it in the best strains of Snow's Winter White. I had almost given up the idea of growing Broccoli, so unfavourable is this locality—cold, wet, heavy soil, with a superabundance of atmospheric moisture, a night or two in which the thermometer falls 10° or more below freezing, and then comes a drizzling rain. But here is the point: It is not altogether the locality, but the worthless seed we have sent us. I have this year been gratified with row after row of Snow's Winter Broccoli, and every plant formed a head the size of a breakfast-cup or thereabouts, and that at a season when, of all others, a really good vegetable is highly appreciated—viz., on and after Christmas, and Broccoli above all vegetables is welcomed then. I have not been one week without Cauliflowers or Broccolis since the beginning of June, and now we are just commencing with another valuable Broccoli—viz., Veitch's Spring White. This, with one or two others, will carry us on to within a week or two of early Cauliflowers. This is a very late garden, or probably we should have Cauliflower before the last Broccoli was cut, as we have before now.—JOHN TAYLOR, *Maesgwynne.*

### PEACH FORCING.

I NOTICE in page 116 a letter on the above topic from my worthy friend Mr. Taylor, and beg for a short space in reply.

I understand Mr. Taylor to say that Peach houses, shut up at the beginning of December and kept at 45° to 50°, will now (first week of February), be in full flower. My first Peaches were shut up on the 10th of December, and I enclose you a shoot with the fruit attached, so that you may judge for yourself. I may remark, when I begin to force Peaches or anything else, I like to force in the proper sense of the word. I maintain that Peaches will set better at 55° to 60° than at 45° or 50°.

The general treatment our Peaches have received is of the simplest kind—merely to keep the house at 50 until the flower can be seen to show the colour, raise the temperature to 55 until the flower is fully developed, then keep steady at between 55 and 60. The paths and borders have been duly syringed daily whilst setting, and the trees syringed every day before they came into flower. Now, respecting fertilising the blossoms, I may say that I have practised it for years, and with

fair results. However, I have three more Peach houses, and will certainly give Mr. Taylor's plan an impartial trial.

With the latter part of Mr. Taylor's letter respecting thinning I altogether disagree. Whether good gardening or not, I always, if possible, play a surer game, and one that has for thirty years served me well—allow plenty of fruit to remain until you see the second swelling commences, and then, but not until then, thin to the proper distance apart.—R. GILBERT, *Burghley, Stamford.*

[The Peach branch sent by Mr. Gilbert (Feb. 11th), was a foot in length, and had on it twenty Peaches, each the size of a medium pea.—EDS.]

## A CENTURY OF ORCHIDS FOR AMATEUR GROWERS.—No. 20.

### PLEIONE.

Thus, popularly known as Indian Crocus, is a small genus often included in *Ceologyne*, but abundantly distinct. Naturally the species grow upon the branches of the forest trees, and as they bloom without their leaves, they are said to set the trees all ablaze with their bright-coloured flowers. The fact of their blooming without foliage has caused many to lodge complaints against them, and to assert this completely spoils the effect. Where there's a will there's a way, however; and as I am of opinion *Pleiones* never are fully at rest, there is nothing to prevent a few plants of such subjects as *Nephrodium molle* and some other erect-growing Ferns being planted in the pots just when the leaves begin to fade, and by the time the flowers expanded the Ferns would compensate for the loss.

*Pleiones* should be grown in pots in a mixture of rough peat, sphagnum moss, and old dried cow manure. The pots should be well drained. During the growing season they enjoy an abundant supply of water, and when the leaves begin to change colour water should be withheld to some extent; but when the flower buds at the base of the pseudobulbs begin to show signs of moving, a little extra water may be given.

*P. humilis.*

*P. WALLICHIANA.*—This species is also known by the name of *præcox*; it usually flowers from October to December. The blooms are large and very handsome; sepals and petals deep rosy purple, the lip of the same colour, with the centre white. Native of the Himalayas.

*P. MACULATA.*—In habit this plant is similar to the preceding; all of them, however, have some slight differences in the shape of their pseudobulbs. Sepals and petals soft mauve; lip veined and blotched with rose and brilliant crimson. Native of Assam and Khasia.

*P. LAGENARIA.*—Undoubtedly this is the most beautiful of the kinds yet introduced, the habit of growth is like the preceding; all of them, however, have some slight differences in the shape of their pseudobulbs. Sepals and petals soft mauve; lip veined and blotched with rose and brilliant crimson. Native of Nepal and Khasia.

*P. HUMILIS.*—In the shape of the pseudobulbs this is the most distinct of the species here enumerated. Flowers large; sepals and petals bright warm rose; lip white, streaked and spotted with crimson. Native of Khasia.

### ODONTOGLOSSUM.

In the first half of my task I detailed the treatment

necessary for these plants; the two species here mentioned, however, have been found to enjoy a little more warmth than most of their relatives.

*O. CITROSIMUM.*—The pseudobulbs and leaves of this species are bright shining green in colour; the spikes are pendulous, bearing numerous pure white flowers; in some varieties the lip is tinged with soft rose. This species is, perhaps, more correctly named *O. pendulum*. It enjoys good exposure to the sunlight. Native of Mexico.

*O. citrosimum.*

*O. PHALENOPSIS.*—A very dwarf-growing and handsome species, producing small pale-coloured pseudobulbs and light green leaves. The spikes has two or three large, flat, and very handsome flowers, which last a long time in perfection; sepals and petals pure waxy white; lip white, with a large blotch of purplish crimson extending over the greater portion, but leaving a pure white border. Native of New Grenada.

### TRICHOPILOIA.

With one species of this genus I shall bid adieu to my readers on this subject for the present; but if the Editors of our Journal will sanction it, I have no doubt there will be something for me to say upon those species and varieties omitted in this enumeration.

*T. CRISTA.*—Is at once a dwarf, compact, and handsome plant; the pseudobulbs are somewhat stout, and bear a single dark green leaf; the spike has from two to three large flowers of a light reddish crimson, saving the sepals and petals, which are edged with white. It blooms twice in the year, and lasts a long time in beauty. The treatment recommended for *Cattleyas* suits it admirably. Native of Central America.—EXPERTO CREDE.

## THE VALUE OF FUEL.—No. 3.

WHATEVER the medium through which the heat of the fuel is conveyed into the house, it is of the first importance that the extent of surface provided for its diffusion should be ample. In the case of flues it is well to have the part nearest the furnace of double thickness, by which means there is less heat given off at first, and more preserved for the remoter end of the house. It is also very advisable to make the flue area smaller near the furnace, both because the gases must then pass more quickly where they are hottest, and consequently have less time to cool, and because there is thus a great security against their escape through the joints or cracks of the brickwork, it being, of course, understood that the chimney through which their final exit is made is of not less internal area than any part of the flue. When this is the case

there is a suction going on through the whole length, which will draw in the air through any fissure; whereas, if the exit is contracted and the throat of the furnace large, there is a forcing of air into the flue, which seeks its way out wherever it can find an opening. Attention to this principle would cure a large proportion of smoky chimneys.

But although water neither allows gas to escape nor can become heated above  $212^{\circ}$ , there is also in its use necessity for ample extent of pipe. The temperature even of  $212^{\circ}$  is too hot, and causes a certain deterioration of the air. Probably  $150^{\circ}$  is the utmost consistent with salubrity. Further, if the pipes become heated nearly to their full extent, there is trouble with escape of steam, diminution of water, incrustation of the boiler, and finally a considerable chance that fuel may be wasted, because more is burned than the water can cool. But, subject to attention to this rule, water presents great advantage for the transmission of heat on account of its high specific heat—*i.e.*, the large amount which it absorbs for each degree of rise of sensible heat, and gives off again in cooling for each degree of loss of sensible heat. Weight for weight, it thus absorbs and gives off fully four times as much heat as air, and bulk for bulk nearly three thousand times. Hence a pipe containing hot water will give off three thousand times as much heat as the same pipe containing hot air, or, in other words, will convey the heat three thousand times as far with the same loss. Brickwork being a much worse conductor of heat than iron (in about the proportion of 1 to 3), and a brick-on-bed being thirty or forty times the thickness of an iron pipe, while a flue is generally four to eight times the area of a pipe, the difference is partly compensated; but it may still be reckoned that a flue will only convey its heat to one-fourth or one-sixth the distance that a hot-water pipe will.

Before dealing with the actual amount of fuel which is required for heating various structures, it is necessary to determine what proportion of the total heat evolved may be fairly considered to be available in practice. The tables on p. 115 show the amount produced by each fuel, and, as already observed, the waste is but trifling when the fuel is burned within the structure to be heated, or when the heat produced is abstracted through a sufficient prolongation of flue. When the fire is in a stovehole, it would not be difficult in general to make the ventilation of the stovehole pass through close stone pipes led within the house to be heated, and in this way a large amount of waste might be economised. If, then, care is taken to save as much of the heat as is possible, we may reckon that a deduction of ten per cent. ought to be ample to cover the total waste. The amount requisite to produce a draught in the chimney is too trifling to require notice. I have found by experiment that a temperature of  $40^{\circ}$  above the air in a chimney 15 feet high occasions a sufficiently strong draught, and a temperature of  $70^{\circ}$  above the air a fierce draught. Now, for the combustion of each pound of coal about 20 lbs. of air, equal to 270 cubic feet, are requisite, allowing, as is found to be the case, that only half the oxygen in the air combines with the fuel. The heat of these 270 feet on passing through the fire would be about  $2500^{\circ}$  Fahr., and therefore, if the temperature of the chimney is  $60^{\circ}$  above the external air, the allowance of heat necessary to ensure a very powerful draught is under one-fortieth part of the total heat generated by the fuel. I propose, therefore, in the following calculations to assume that coal ought to give 12,000 units of available heat to the structure which is to be warmed. And it is, of course, understood that 12,000 lbs. of water raised 1 is exactly the same thing as 6000 lbs. raised  $2^{\circ}$ , or 1000 lbs. raised  $12^{\circ}$ , and so on. Now, 12,000 lbs. of water are equal to nearly 192 cubic feet; but the heat absorbed in raising water 1 is sufficient to raise 3000 times (very nearly) the like bulk of air 1, consequently the heat yielded by 1 lb. of coal will raise  $192 \times 3000$ , or 576,000 cubic feet of air  $1^{\circ}$ . So much for the quantity of air that can be heated by 1 lb. of coal.

Now for the cooling. Let it be kept in mind that air would remain stationary in temperature unless the heat is allowed to pass off, and it will be seen that its absolute loss of heat does not depend on its bulk, but upon the nature of the media by which it is surrounded; hence the common method of estimating heating power by so many feet of pipe required for so many cubic feet of contents of the house is only a rough-and-ready way of approximating to the extent of cooling surface by which the air is surrounded; but it is more accurate to take the cooling surfaces directly. The experiments of Hood have shown that each square foot of glass cools about  $1\frac{1}{2}$  cubic foot of air as many degrees per minute as the external tempe-

ture exceeds the internal. If this excess is  $1^{\circ}$ , then 1 square foot of glass cools  $1\frac{1}{2}$  cubic foot of air  $1^{\circ}$  per minute; or 460,800 square feet of glass will cool 576,000 cubic feet of air per minute, which, as we have seen, is the quantity of air that 1 lb. of coal will heat  $1^{\circ}$ . Therefore 1 lb. of coal burned per minute will supply the heat lost through 460,800 square feet of glass; or dividing by 60, 1 lb. of coal burned per hour will supply the loss of heat occasioned by 7513 (say, for convenience, 7500) square feet of glass in the same time, when the external temperature is  $1^{\circ}$  below the internal. For any other difference of temperatures we must divide 7500 by the number of degrees of difference to obtain the surface of glass which 1 lb. of coal per hour will heat. For any different superficies of glass we must divide 7500 by it to obtain the degrees of heat above the external air which 1 lb. of coal will maintain; and for any additional consumption of coal per hour we have to multiply either the degrees of difference of temperature, or the superficies of glass, found as above, by the number of pounds of coal to be burned per hour to get either the temperature that will be maintained in a given structure, or the extent of structure that will be maintained at a given temperature.

We may express these rules algebraically in the following equations. Let  $C$  be the number of pounds of coal to be burned per hour;  $D$ , the difference of external and internal temperature in degrees; and  $S$ , the superficies of glass in square feet. Then

$$(1.) C = \frac{DS}{7500}, \quad S = \frac{7500C}{D}, \quad D = \frac{7500C}{S}.$$

From which, when any two of the quantities  $C$ ,  $D$ , and  $S$  are fixed, the third can be found. Or, in words: To find the coal required to keep a given structure at a given difference of temperature, multiply the superficies of glass in feet by the proposed difference, and divide by 7500.

To find the superficies of glass which will be maintained at a given difference of temperature by a given quantity of coal, multiply the pounds of coal per hour by 7500, and divide by the intended difference of temperature.

To find the difference of temperature that will be maintained in a given structure by a given quantity of coal, multiply the pounds of coal per hour by 7500, and divide by the superficies of glass in feet.

These rules are quite independent of the manner in which the heat is conveyed or applied in the structure, whether by Arnott stove, flue, or hot-water pipes, provided only the arrangement be such as to yield twelve parts of the heat of coal, which, when burned, gives thirteen to sixteen parts. If the coal be of very inferior heating power it may be proper to use 7000 instead of 7500 for a constant. The same rules also apply to other species of fuel, substituting a different constant in place of 7500. This constant may be obtained by multiplying 7500 by the units of heat belonging to the fuel in question (less ten per cent. for waste), and dividing the product by 12,000.

In computing the superficies of glass the woodwork may be included as a sort of set-off against the extra loss of heat through the laps of the glass. The loss through the back and front walls of lean-to houses must also be considered, but it is reckoned by Dr. Arnott at only one-twentieth of that of glass; but, on the other hand, it is important to remember that the effect produced by coal in the foregoing calculation is that for extreme low temperatures in sunless weather, and in comparison with the temperature of an unheated greenhouse. The night temperatures will always be by fire heat in excess of what has been shown, because as, even in cloudy weather, the day temperature of the air is almost always  $10^{\circ}$  to  $20^{\circ}$  higher than the night, there is bottled-up in any glass structure, in the soil, and walls, an amount of heat in the day which is slowly given off at night, and which to that extent diminishes the amount of coal required at night to maintain a given temperature. Gardeners are familiar with the saving of coal effected by early closing in sunny days, and a like saving accrues in a less marked degree even on sunless days. The formulae given above must therefore be taken as the extremes that can be required by firing alone, in protracted periods of sunless weather, of uniform temperature. In such conditions I have found them hold good in practice.

The next point is to ascertain how many feet of (say 4-inch) pipe are required in order to convey and transmit, through the water to the surrounding air, the amount of heat produced by 1 lb. of coal per hour. Now, it may be deduced from Hood's researches on the rate of cooling of iron pipes that 1 foot in length of 4-inch pipe, which contains 150 cubic inches of water, weighing 5.125 lbs., loses  $681^{\circ}$  per minute, or  $4086^{\circ}$  per hour,

when the water is  $100^{\circ}$  above the temperature of the surrounding air. But as 1 lb. of coal raises 12,000 lbs. of water  $1^{\circ}$ , it will raise 5,125 lbs. (that is to say, the water in 1 lineal foot of pipe),  $2201^{\circ}$ , or the water in 55 lineal feet  $40.86^{\circ}$ . Hence 1 lb. of coal per hour will keep 55 feet of 4-inch pipe at a steady temperature of  $100^{\circ}$  above the surrounding air, or 5500 feet  $1^{\circ}$  above the surrounding air. Then, if we take  $p$  to represent any different length of pipe, and  $d$  to stand for any other difference between the temperature of the pipe and of the air in the house, we shall get the following equations, corresponding to those given for the heating of air,

$$(2.) p = \frac{5500C}{d}, \quad d = \frac{5500C}{p}, \quad C = \frac{pd}{5500}.$$

The first of which may be expressed in words thus:—

To find the length of pipe which a given number of pounds of coal per hour will maintain at a given temperature, multiply the pounds of coal by 5500, and divide by the difference between the heat the water is intended to be kept at and the intended heat of the house.

The other formulæ may be reduced into words in like manner.

Finally, if we wish to express any one of the quantities  $p$ ,  $d$ ,  $D$ , and  $S$  in terms of the others, by taking from the formulæ (1) and (2) the common value of  $C$ , and equating, we obtain

$$(3.) p = \frac{5500DS}{7500d} \text{ nearly; } d = \frac{11DS}{15p}, \quad D = \frac{15dp}{11S}, \text{ and } S = \frac{15dp}{11D} \text{ nearly.}$$

The first of which formulæ may, for an example of the rest, be expressed thus:—

To find the length of pipe which, at a given temperature of the water, will heat a structure having a given superficies of glass to a given temperature, multiply the superficies by eleven times the intended difference between the outside and inside temperatures, and divide the product by fifteen times the intended difference between the heat of the water and the air of the house. And having thus found the value of  $p$ , if we substitute it in the equation  $C = \frac{pd}{5500}$  we shall get the quantity of coal necessary to give the desired result in the given conditions.

The data on which these expressions and rules are founded are well known; but the method of deriving them and the formulæ for calculation are, so far as I know, new, and may therefore have admitted error. I shall therefore be glad if any of your correspondents will kindly point out any mistake they may discover. Subject to such correction, the formulæ will be found very useful in adapting heating apparatus to any new structure or in testing the performance of any existing arrangements.—J. BOYD KINNEAR.

### TO YOUNG GARDENERS ON RENOVATING OLD FRUIT TREES, AND OTHER SUBJECTS.—No. 3.

It is from youthful vigorous trees that we must remove large branches and roots. I am well aware that large trees when in sound health and favourably situated will bear the removal of large limbs without apparent injury, and the wounds will heal rapidly; but such amputations often lay the foundation of decay. This also arises in many cases from the roots being in a cool wet subsoil, where the central ones become decayed, and the evil gradually extends to the body of the tree. To head-down a tree in such a condition for grafting, or to form a new head, or even to cut off any part with the object of improving the tree, will only end in disappointment. In all such cases it is well to consider whether it is not advisable, if the tree can be spared, to at once replace it. If this is not to be done, let the large branches alone, but thin-out the small ones, and remember that the roots play an important part in restoring vigour.

If much younger trees are not thriving or have been neglected, and it is thought necessary to head-down or cut back for grafting, yet if the roots are in difficulties, the foliage of the young wood from the grafts will in a year or two assume the appearance of having been plated with silver, be turned to a glossy milky colour, or in other cases to a sickly yellow. I have seldom seen such trees recover if not taken in hand immediately. If left for a year or two they may be at once removed, as they will never do any good. We should secure a stock of young trees to take their place—not mere maiden trees, but those of four or five years' growth, which may be

expected to bear some fruit at once. It is somewhat strange that it is quite possible a tree may present no sign whatever of unnatural-coloured leaves before the branches are cut off, although in cool subsoils combined with almost sunless aspects, such as north borders, we find single branches assuming this character: cut them off, and the like will appear again. It is an unmistakeable sign that all is not right at the roots, and the sooner these are brought near the surface in new soil the better. To head-down such a tree with its organisation so disordered would be folly. Until its foliage appears in its natural character it is best to ease-off any outlying branches, and carefully lift the roots and remake the border.

Cutting off large branches is a frequent means of bringing this disease about with certain varieties, the sudden shock to the whole system being more than the tree can endure. I will give an instance. From a young Morello Cherry tree in a north border it was deemed necessary to take the centre branch; before doing this the tree was, to all appearance, in the very best of health, yet the following summer it produced this unnatural-coloured foliage and refused to grow an inch. In another case some, to all appearance healthy, bush Apple trees were headed-down and grafted; they made rapid growth and formed nice bushy heads, yet in the third year they, too, had this sickly hue and ceased to grow. In this instance the position was the reverse of that in which the Cherry was planted, but the subsoil was bad, and the surface soil unfavourable to fruit trees. These are not solitary cases; I have witnessed hundreds similar, and I contend, like Mr. Müller, that more trees are destroyed by the amputation of limbs than all other causes put together. I have always found that trees on a dry open subsoil bear severe pruning better than those on cool soils, but would advise that on no occasion whatever, if a tree is to continue to be prosperous for any considerable time, should large branches be sawn off—for instance, branches of 6 or 8 inches in diameter. Any large wound which may be made should be immediately covered with a waterproof composition to preserve it from the action of the atmosphere and from insects.

There is a right and a wrong way of cutting-off limbs. Almost invariably we see trees headed-down with the branches severed horizontally, forming a receptacle for all noxious substances to penetrate into the wound. Avoid this at all times, and always cut in a vertical direction. I am of opinion that there are certain ages beyond which trees cannot have their heads or limbs taken off with any chance of the wound healing over. In every garden and orchard may be seen clumsy wounds left from 3 to 6 inches from the main stock or branch, and the decay can be traced passing downwards without the least effort on the part of the surrounding bark to cover the wound; the tree gradually sinks, and at last refuses to produce even a leaf.

I remember that about twenty years ago some orchards were to be converted into market gardens. Many of the trees were large, sound, and vigorous, but bore small useless fruit; they were headed-in, but not closely, and grafted well out on the tops of the branches, placing in many instances on one tree from 150 to 200 grafts of the best-bearing varieties, which were generally of slow growth. Immense crops were produced for a few years, then the foliage assumed a sickly colour, and died. The trees paid well even at this time, and, of course, young trees were growing up to take their place in filling the baskets for market. This is just what ought to be done in private establishments. It was evident, however, that the union between the stock and the scion was never a happy one from the first. The grafted trees made vigorous efforts to replace the limbs which had been cut off by pushing every hidden eye into growth, and if these had been allowed to appropriate the abundant supply of sap sent up by the roots, I have little doubt the trees would now be in a healthy state. In support of this view I may state that the trees which were grafted with stronger-growing varieties are to this day as vigorous as need be, and this I ascribe to the heads being capable of elaborating the abundant supply of nourishment provided by the roots, and returning to these all that was wanted to support the underground working power. In the case of the slow-growing varieties placed on strong-growing stocks there was no such balance, as for the large supply of crude food sent up by the roots there was no machinery to elaborate it properly: hence decay set in. In heading-down a large tree, then, would it not be advisable to shorten the roots at the same time, in order to preserve the balance, or make it incline to whichever side we wish? Thus, if we want to render the head more vigorous we encourage the

roots, reduce the crop, and displace old wood with young; but if the object is to diminish vigour and produce more fruit, go at once to the roots and shorten them.

In the article on this subject, page 51, second column, the words, "The whole economy of the tree is disordered," should be omitted.—J. TAYLOR, *Maesgwynne*.

### BALSAM CULTURE.

THERE are few plants grown for the decoration of the conservatory or show-house that are more beautiful than the Balsam. Very pleasing is their combination with other choice plants, being graceful in outline, with a profusion of soft-tinted flowers relieved by an abundance of delicate foliage. They are easy of culture; their flowers have a delicate perfume, and where a constant display is required, they are of great value to the gardener. They should be grown about 2 feet 6 inches to 3 feet in height, and about 20 to 24 inches through, and as vase plants or for the dinner-table they have few equals. I usually sow in the first week of the new year, and about every two months up to June or July to keep up a succession. A suitable compost is good fibry loam, leaf mould, and old decayed cow dung and silver sand. It ought to be borne in mind that few plants suffer more from any sudden change of temperature than the Balsam, therefore the compost should be warmed. It is best finely sifted; give good drainage; cover the seeds about an eighth of an inch deep, and plunge the pots in a gentle bottom heat; then water sparingly till the plants appear, when they must be well exposed to light. As soon as they have made their second leaves transplant them into large 60-pots, the pots being first placed in the house to get warmed (if not new, they must be well washed), for the Balsam is very susceptible of injury from damp or cold, although not requiring a high temperature to grow it successfully. In potting, great care is required to separate the plants carefully so as not to injure the roots, and not to press the soil too firmly so as to bruise the soft stems of the plants; cover the stem up to the seed leaf. They require to be shaded for a few days till their roots get hold, after that shading may be discontinued, and the plants exposed to the air and light. The water applied should be tepid, and liquid manure frequently given them. The more liberal the treatment the stronger the growth. Never allow the plants to want for water, but give it them according to growth. A suitable temperature is 72° to 75°, and on sunny days they will take no harm at 80°.

The bottom branches should be kept pegged down to the surface of the pots. As soon as they have lifted the pots with roots they must be repotted. Never allow them to become pot-bound. I pick the flowers off till they are of the size required. The pots must be shifted into a cooler house before being placed in the conservatory, so that they may not suffer from a sudden change. In the summer plunge them up to the rim in ashes in a pit. Last year I had them in bloom in February in the conservatory, and kept up a succession to the end of the season.—F. P. LUCKHURST, *Mill Bank Hall*.

### GREEN'S BOILERS.

IN the interest of those who are about to erect or change hot-water apparatus for plant structures, and wish to have the evidence of recent practical tests, we can add our own favourable testimony to that given by the Royal Horticultural Society, in its report, on the efficiency of Green's new wrought-iron boiler (saddle-fashion). It should be previously remarked that the boiler sent out by Messrs. Green & Son in 1869 and the present boiler are as dissimilar as possible; the improvements carried out in the latter constitute it one of the most effective apparatus ever offered for horticultural purposes.

The large one now at work in our establishment is 4 feet 6 inches in length, 4 feet 6 inches in height, and 2 feet 4 inches in width; heating most efficiently 3393 feet of 3 and 5-inch piping, part of which is 240 feet from the boiler, and a considerable extent of it is 200 feet distant, whilst its present power is such as to warrant in milder weather an average circulation of 5 to 800 feet further in extent. This boiler admits of 80 square feet of heating-surface fully exposed to the action of the fire, which acts on four flat water plates across the boiler, each plate being 2 feet in width by 4 feet in length, the collective heat being utilised within the boiler without waste in the flue or chimney, thus heating a greater extent

of surface than any other boiler yet known to us. Amongst its advantages are the following:—When placed in the usual recess under cover it requires no brickwork in setting. In the event of any injury or accident the boiler can be removed by an efficient workman, without interfering with the bottom tubular bars, and be replaced with another in nine hours.

These very important features have served to displace the upright tubular boiler in favour of the present one, the former being found impracticable to repair within a period of safety, and otherwise involving a very considerable risk and expense. Having had to remove two of the upright tubular boilers in consequence of fracture, and each involves a whole week to replace, it will on comparison be readily inferred that our present boiler is really a boon to horticultural establishments. With the upright tubular boiler connected with the same extent of piping we never average more than an intermediate temperature, falling far short of the heat required when most needed; whereas in our present boiler we find no difficulty in maintaining an average hothouse heat.

As a proof that Green's boiler utilises the whole heat without waste, the flues leading to the chimney are nearly cool in comparison with other boilers in full work. The flues formerly required special precaution to be taken to avert danger by the waste heat rushing along the flues and passing through tofts where hay and mats were stored for convenience; this risk is now entirely removed by the waste heat being duly turned to its proper account. We calculate that this boiler does its work cleverly and uniformly with two-thirds of the fuel required for the No. 5 upright tubular, which this replaces, and a still further important saving is effected by its fuel not being restricted to coke; such is the equable power of its combustion that the fire burns equally briskly with a general mixture of clay mixed with cinders or other combustible garden refuse. Having a large bed of extracted clay contiguous we feed our fires with it throughout the day, and bank-up with coke at night. Being formed with water bars, the fire chamber is not encumbered with large clinkers, neither is the fuel subject to hanging up as in some other boilers: hence it is far more readily cleaned, and by its equable combustion can be safely left for a length of time without risk of check in circulation.

This boiler is found superior to any other yet used by us; its special merits being quick circulation, economy in fuel, sustained power, and adaptation for immediate repair or replacement under any possible exigency. We have four of these boilers alike efficient in their working, and we shall have pleasure in showing the apparatus at work to any gentleman amateur, or gardener.—E. G. HENDERSON & SON, *Wellington Nursery, St. John's Wood*.

### NOTES BY THE WAY.—No. 2.

IT was a bright frosty morning when I left Lyons on the 9th of this month (January) and turned my face southward by the railway to Marseilles. It was not long before the train entered the grand valley of the Rhone, not now smiling with rich verdure and luscious fruits, as I have often seen it before, but shrouded in a garment of white, indicating that for a time nature was dead, only to spring into the renewed life which is sure to follow. The Vine-dressers were busy with their *serpettes*, cutting-out the last year's wood and binding it into little bundles for fire-kindlers. Those of the Mulberries which required pollarding were undergoing that operation. I do not mean the black-fruited Mulberry, but the white, which is grown for its leaves to serve as food for the silkworm; for, be it remembered, we are now in the region of silk, and here in this fertile valley is it produced in large quantities all the way down to Marseilles and Montpellier. The trees are just like pollard Willows, the object being to obtain as strong shoots and vigorous leaves as possible, and this can only be done by cutting-down the large branches and inducing a strong young growth. How the old grey rocky steeps reflected back the bright light of a glorious sun, which accompanied us all the way till we passed Montelimart! and then he went down under the hills of Ardèche, leaving us in darkness all the way to Marseilles. It is a grand sight, the valley of the Rhone, either in summer or in winter, but in winter especially it looks stern and severe, fenced-up as it is on either side by the rugged and almost precipitous mountains of grey rock; but these in summer, where terraces have been formed, are smiling with fruitful Vines. The Alps, sensibly near by the cold air they diffused as we approached them, were covered with snow, which the declining sun lit with a varied beauty. After passing Orange and Avignon

there was a perceptible change in the temperature, which improved as we got nearer Marseilles.

On the following morning, when I turned-out of the Grand Hotel Noailles to see the changes that had taken place in the old city since last I saw it many years ago, I was struck by the extreme mildness of the temperature; and thinking a change had taken place in the night, I remarked to the porter that it had become very mild, at which he shrugged his shoulders and rather differed in opinion from me. I asked how long this had lasted, and he said all the winter, but that they considered it rather disagreeable than otherwise, for they usually had it much warmer than this. I was convinced now I was nearing the subtropical region I had so longed for. In the entrance hall of the hotel the sides were lined with large tubs planted with *Euonymus japonicus* in full fruit, handsome plants 6 feet

high. In the market were an abundance of Artichokes, and I observed plants ornamented with paper flowers of various colours, much in the way that the small Spruce Firs were at Lyons with the dyed flowers of *Xeranthemum annuum*. I did not make any stay in Marseilles through a desire to terminate my journey, which had now become very tedious, and I shall endeavour to see something or anything in the way of gardening that I may consider worth notice on my return homeward.

From Marseilles the railway into Italy is a single line, and its course is all the way close to the shore of the Mediterranean, sometimes through narrow passes of bold rocky alpine scenery, from which it emerges at intervals again to afford a full view of the sea. All the way to Nice there is little to be seen in cultivated grounds but Vines and Olive trees, with occasionally the White Mulberry, indicating that silk is produced, and the

VIEW FROM THE GROUNDS OF THE CASINO AT MONTE CARLO.

hills are covered with *Pinus maritima*, *P. halepensis*, and Evergreen Oaks. Between Toulon and Cannes I observed considerable plantations of the *Gnaphalium*, the flowers of which are dyed for "everlastings," and of which the "immortelles," now become so common among us, are made. I had no opportunity of examining it closely enough, but I believe it to be the *Gnaphalium margaritaceum*. It is grown in the fields in the same way as Lavender is grown by our herb-growers at Mitcham and Hitchin. When we got to Cannes the aspect of vegetation began to change. Oranges appear; and here and there between Cannes and Nice we see specimens of the Date Palm. These become more numerous as we proceed on the journey, until, reaching Monte Carlo, they become quite the leading feature in all effects produced by the landscape gardening of the district. Monte Carlo, which is a suburb of Monaco, and where the only remaining gaming tables in Europe are to be found, is one of the most charming spots that can be conceived of. The grounds attached to the Casino have been very artistically laid out; and here it is that the Palms are to be seen in their best condition, as ornamental trees. Our figure will give some idea of the style of gardening which has been followed. But it is at Bordighera, a few miles beyond Mentone, on the Italian frontier, where these Palms are grown to a large extent, and whence the supplies of Palm branches are derived with which Rome is supplied for the services on Palm Sundays.

When I looked from my bedroom window of the Hotel de la Mediterranée, at Mentone, on the morning after my arrival, what a new and marvellous sight presented itself! Close upon the town there is a range of steep little hills, richly clothed with vegetation, which have been girdled with numerous terraces one above the other, and studded with smiling villas in every variety of fancy forms, each standing in a garden of Orange and Lemon trees. The trees are groaning under the load of the golden fruit, the crop of which is now ripening, and in some cases this is so great as to require props to support the branches. Such a sight is like a transformation scene. Away beyond these little hills there rise, by a gradual succession of waves of rugged rock, still higher grounds also terraced, wherever a modicum of soil can be obtained wherewith to make Orange and Olive groves. The soil is rich where there is any, and nothing so exemplifies the patient industry of these hard-working Ligurian people than the fertility with which they have clothed these apparently barren hills, and this process goes on higher and higher still till it reaches, as at S. Agnese, a height of nearly 2500 feet. S. Agnese is one of a group of these high peaks which form a range of mountains enclosing Mentone from the north, and protecting it from the cold winds coming from the Alps in that direction, and the spurs of these mountains form a barrier on the east and west, so that by this shelter from all the worst winter winds that blow has, with its fine pure air, warm climate, and

sea influence, rendered this little town the health-giving blessing it has been to many.—*R., Mentone.*

### PRIZES FOR DISEASE-PROOF POTATOES.

The following are the prizes and conditions upon which the Committee of the Royal Agricultural Society recommend the £100 offered by Lord Cathcart last year for essays on the Potato disease, and which was not awarded by the Committee, to be applied. We give them in full in order that our readers may be supplied with the information requisite for an intending competitor:—

I. The Committee recommend the offer of the following prizes—(1) For an early Potato, which shall be disease-proof during three years' trial, and possess the best cropping, keeping, and cooking qualities, £100. (2) For a late Potato, which shall be disease-proof during three years' trial, and possess the best cropping, keeping, and cooking qualities, £100.

II. They also recommend that an additional sum, not exceeding £100, be placed at the disposal of the judges to divide at their discretion in prizes to disease-proof Potatoes in the above classes not obtaining either of the foregoing prizes.

III. They further recommend that prizes of the same amount as the preceding be offered for disease-proof Potatoes raised from seed to be sent in for competition during the month of February, 1879.

The Committee had drawn up the following conditions, which they recommended should be attached to the offer of the foregoing series of prizes:—

Each competitor must send 1 ton of each sort of Potato with which he intends to compete, in twenty bags containing 1 cwt. each, so as to be delivered at a warehouse provided by the Society not later than February 21.

Each bag must have a parchment label attached, giving both the name and address of the competitor and the name of the Potato. These labels will be removed by the Secretary of the Society, who will see that each bag is legibly stencilled with the number which will be assigned by him to the competitor.

One hundredweight of each kind of Potato sent to compete will be forwarded to a Potato-grower in each of the several districts of the United Kingdom as follows:—North Yorkshire, South Yorkshire, Cumberland, Fylde district of Lancashire, Marsh district of Lincolnshire, Essex, Higham district of Kent, Devonshire, Staffordshire, Bedfordshire, South Wales, North Wales, Merayshire, Perthshire, the Lothians, Renfrewshire, Ulster, Connaught, Leinster, and Munster.

Each Potato-grower will be instructed to plant the competing kinds of Potatoes in the same field with his own Potato crop in adjacent plots, carefully keeping each sort distinct, and submitting each to precisely the same treatment as his ordinary crop. He will also be instructed to keep a careful and precise record of every event connected with the growth of the experimental Potato crops, including the dates of all agricultural operations, the quantities of manure applied, with the time of application, the appearance of the several plots from time to time, notes of the weather, and other information connected with the growth of the crop. Books prepared for this purpose will be furnished to each grower by the Secretary of the Society.

The crops will be carefully harvested, and weighed in the presence of a representative of the Society; each kind will be carefully kept separate, and thoroughly examined for diseased tubers. The proportion of diseased tubers, should any be found, will be carefully noted. The crops yielded by the competing kinds of Potatoes will be the property, and at the disposal, of the Society; and the growers will be paid for the use of their land, cost of manure, tillage operations, and all other accommodation at a price to be previously agreed upon.

The trials will be repeated next year with the produce of the competing kinds that may be found to resist disease on all the experimental plots this year; and similarly they will be repeated in 1876, with the produce of those that have resisted disease in the two previous years. The awards, if any, will be made early in 1877.

The judges will be instructed not to award any of the prizes except to the owners of competing kinds of Potatoes that are found to resist disease during the whole of the experimental period of three years.

Every competitor, whose Potatoes shall be attacked by the disease during the experiments, may be required to pay such sum as the Council may determine, not exceeding £20, towards the expenses of the cultivation of each kind of Potato sent by him to compete for the prizes offered.

Inspection of the growing crops by a representative of the Society will be made, once at least, during their growth.

In addition to the foregoing scheme of prizes and experiments, the Committee also recommend that each member of the Council be requested to furnish to the Secretary of the Society the names and addresses of any growers of Potatoes on a large scale within his district.

That some of the principal local agricultural societies be requested to furnish similar information.

That a series of questions be prepared to be sent as soon as possible to such of those growers as the Committee may select, in order to obtain the results of their experience, and that a report based on such replies be prepared for early publication in the Journal of the Society.

The Committee further recommended that Messrs. Jabez Turner, W. H. Wakefield, W. Carruthers, G. Hope, and J. Baldwin (Glasnevin), be invited to act as judges of Potatoes; and that a sum of £50 be placed in the hands of the Secretary to defray current expenses.

This report was adopted on the motion of Mr. Whitehead, seconded by Mr. Jabez Turner; and it was announced that the Directors of the Agricultural Hall Company would place a suitable warehouse for the reception of the competing kinds of Potatoes, rent free, at the disposal of the Society.—(*Land and Water.*)

### ENTOMOLOGICAL GLEANINGS.

Mr. Worsfor has recently communicated to the Brighton Natural History Society the result of some of his investigations regarding the uses of the antennæ of insects. He is as yet unable, however, to place before us such definite information as will leave the matter open to no question. In his paper he carefully considers the three leading hypotheses—namely, that these organs are either the seat of the sense of touch, of hearing, or of smelling. A variety of observations have been given by the advocates of these different views, each mainly in support of his own. As Mr. Worsfor points out, there is no doubt at all that the antennæ are employed by many insects as organs of touch; but that still leaves it doubtful whether these are not intended primarily for another purpose in addition. Insects have been repeatedly seen to direct the antennæ towards the quarter whence a loud or sudden noise proceeded; and in the case of the larger Crustacea, it may be considered as proved that the organs of hearing are situated at the base of the long external antennæ. The microscopical researches of Newport and Hicks also point to the conclusion that among the insects the antennæ subserve the same purpose. As far back as 1817, however, Erichson's investigations had brought to light the fact that the walls of antennæ are full of small pores, and these pores contain fine hairs, in which he thinks the sense of smell is situate. Coupling this with the circumstance that the moths belonging to the Bombyx family, and which are attracted by the females from long distances, have large and deeply-pectinated antennæ, Mr. Worsfor holds to the belief that the antennæ are organs of smell.

An illustration of those occasional singular assemblages of insects in large swarms is given by Mr. Cole in the "Entomologist." He observed last August, near Woodford, in Essex, that a patch of Fern and Broom, about four 4 square, was almost black with hosts of a little fly (*Sepsis cynipsea*), all slowly moving and vibrating their wings in a peculiar manner, while some object not apparent was engaging their attention. A few sweeps of a net brought together a mass of flies that weighed more than half a pound, and in bulk the flies exhaled a strong odour of Lemon Thyme.

A singular instance of the tenacity of life has recently been noted. An entomologist in capturing a specimen of the Grayling Butterfly (*Satyrus Semele*), struck off its head. The insect lived in a pill-box for four days afterwards; and during this time, if occasionally liberated, it would fly a short distance.

A correspondent of the "Entomologist" suggests that the agency of hydraulic pressure is the means by which many insects escape from the pupa-case. He observed in several hundred individual moths belonging to two species that enter the pupa state in wood or the stem of a succulent plant, that when the insects burst open the case they emitted a fluid which filled the anal segments of the case, and no doubt assisted in their extrusion.

Writing on the subject of parasitic flies, Mr. Spicer observes that though the least likely place to discover the larvæ of an *Anthomyia* (or "flower-loving fly"), would be the human stomach, such larvæ do sometimes exist there. He explains their occurrence in man's interior by the supposition that they are introduced with vegetables which have been standing some time, and on which the mother fly has, "in the innocence of her heart," laid a batch of eggs. These larvæ cling, so it is said, to the inner surface of the intestine by means of minute spines with which the back and sides are armed. Troublesome, perhaps, as occasioning some pain and irritation, these undesired visitants can hardly be dangerous. That such

a thing does over happen is one argument among others against the use of vegetables that are not perfectly fresh; and perhaps our cooks ought to scrutinise leaves, &c., a little more carefully than at present.

## NOTES ON VILLA AND SUBURBAN GARDENING.

**PLANTING RANUNCULUS.**—Observe whether the roots are sound or not; if they are damp or mildewed they are of little or no use. Any piece of ground which has been rough-dug in autumn, and left through the winter to receive the benefit of the frost, is just what the *Ranunculus* delights in. With regard to situation, some spot should be chosen, as remote as circumstances will allow, from hedges, old Box edgings, walks, or anything which might harbour slugs: a level space is to be preferred. Having fixed on a plan to plant, on the morning of a fine day level the bed rather roughly, but evenly, with a three-pronged fork, without putting a foot upon it, then let it remain till two or three o'clock, when it will be dry, and rake it perfectly level; this done, draw a line up the middle, and, with a small trowel, draw a straight furrow, beginning at the centre and advancing to the edge with successive furrows. The amateur should regulate the size of the bed by the number of roots, and dispose of them equally all over it. Place the roots so that the crowns shall be 1½ inch beneath the surface when the bed is completed, and having thus filled the furrow with tubers 1 inch apart, drop a little sand on each, sufficient to cover it, and draw the mould over the whole. The manipulations which have been described are rather laborious from the long continuance of the stooping posture, and they will probably discourage those who are not thoroughly imbued with a love of flowers; but the resolute amateur will remember that no good results are ever secured without toil, and he will be cheered in his labours by the prospect of a splendid bloom.

**SEED-SOWING.**—As the busy season of seed-sowing is at hand, proceed with the general work, both in the flower and the kitchen garden, as fast as possible. Borders containing herbaceous plants that were not dug over in the autumn should, now that the bulbous plants are above ground, be attended to immediately. Instead of being dug they should be neatly forked over, previously dressing the ground, if poor, with rich compost or manure, and taking care to disturb the bulbs as little as possible. Coarse-growing plants, as *Asters*, *Achilleas*, *Phloxes*, &c., must be reduced in size. In doing this retain a portion of the outside, only removing the outer part and the centre; or, if necessary, take up the plant altogether, and, after adding some fresh compost to the soil, replant the best part of the old stool. In this way neat compact plants may be obtained, and, what is an advantage in small gardens, some of the coarse-growing ones will be checked in their growth.

**CUTTINGS.**—Many of the more hardy of the autumn-struck plants for grouping, such as *Pelargoniums*, *Calceolarias*, common *Verbenas*, &c., may now be potted-off into small pots, and placed under the shade of the greenhouse plants until well rooted, so as to be ready to plant out in sand in temporary pits towards the end of March, and set the pots at liberty for other things. Very small pots must be used, the object being to get the compact ball of roots, which, when plunged in sand, will produce a dense mass of fibres, ready to push into the soil directly after the plants are placed in their permanent quarters.

For this reason I would advocate the autumn as the best season for striking cuttings, because every day in spring brings its work, while autumn is comparatively an idle time in the garden. Therefore, as three dozen plants can, on an average, be kept under every superficial foot of glass, let us get over these kinds in autumn, have them potted early in spring and plunged in temporary pits, so as to set the other pits and frames at liberty for more useful purposes. Any new or scarce plants of which your stock may be limited had better be placed in heat to produce cuttings for propagation. Among the plants not so extensively grown as their merits entitle them to be I may mention *Nierembergia intermedia*, *gracilis*, *Lantana Sellowii*, the old *Ruellia formosa*, *Bouvardia triphylla* and *splendens*. Both the latter plants are readily increased by pieces of the roots cut into portions about 1 inch long, placed over some light sandy soil, covered about half an inch deep, and plunged in a gentle bottom heat. The young plants must be potted-off when about 1 inch high. The old plants should be parted and potted in March, and placed in heat until they have produced shoots 2 inches long, after which they must be hardened-off previously to being planted-out. *B. splendens* strikes freely from cuttings, and the other species is best increased by roots.

A few seeds of *Brachycome iberidifolia*, *Schizanthus Hookeri*, *Priestii*, and *humilis*; *Mesembryanthemum tricolor*, *Rhodanthe Manglesii*, *Clintonia pulchella*, *Phlox Drummondii*, and *Portulaca Thellusoni* may be sown in gentle heat to bloom in pots. Some of the autumn-sown annuals will require re-potting.

In the kitchen garden plant a few early *Potatoes* at the foot of a south wall or on a warm border; but if they can be placed on a slight hotbed, so as to start them into growth a little, they will

be as well planted three weeks hence. Make a small sowing of *Lettuce*, and also get in another crop of early *Peas* and the first crop of *Windsor Beans*.

Lay in a stock of different kinds of soil under cover while it is dry, ready for potting next month. In planting flowering shrubs be very particular to plant them at such distances that each plant may have plenty of room to grow and strike out its roots and branches freely. If shrubs are crowded together they become stunted in growth and lanky in form.

If you are forming a clump, or even a plantation, let each shrub be planted 6 feet apart from its neighbour; but if you wish to plant *Roses*, *Syringas*, *Honeysuckles*, and *Lilacs* in your flower borders, they should be from 12 to 15 feet distant from each other, so as not to interfere with the flowers growing below them. October is the autumn month for transplanting shrubs, and February and March are the spring months. March is the last month for transplanting evergreens. When you wish to transplant or plant a shrub, dig a circular hole sufficiently large to receive the roots of the plant, which must be laid neatly down while some person holds the shrub in its proper position straight and upright, cut away any dead or damaged roots, then break the earth well with your spade and throw it into the hole, shaking the plant gently just to let the earth fall closely among the roots. When it is well filled-up tread the earth gently round the shrub to fix it, but do not stamp it. Water each shrub after planting, give a good soaking, and let the plant have a stake to support it.—W. KEANE.

## DOINGS OF THE LAST AND PRESENT WEEKS.

### FRUIT AND KITCHEN GARDEN.

KEEN frost accompanied by cutting east winds brought everything to a standstill except *trenching*. The rough manure placed over the surface of the ground prevented the frost from penetrating deeply. In a previous article allusion was made to the undesirability of trenching the ground when the surface was frozen deeply. Another undesirable practice is to trench in a hard surface where the ground has been trodden or wheeled upon. This is sometimes done, the top spit being thrown to the bottom in lumps if the soil is at all heavy. In such a case it is best to fork the surface over, and if possible allow it to lie for a month or more until pulverised by the action of the atmosphere; and if practicable, it is best to trench when the surface is dry.

**Nailing.**—Where this is not finished it ought to be completed as soon as possible. The Peach wall is generally left to the last; and as the trees of this are more infested by insect pests than any others, it is best to unnaill the trees altogether and renail with new shreds. The old shreds can sometimes be used a second time if they have been dipped in boiling water. In most modern gardens, neat wire trellises are substituted for the old system of nailing. The only danger arising from this method is, that the wood is liable to canker if it is tied too firmly to the wires. Galvanised wire is the worst, ordinary wire painted is the best to use. The wire should be strained tightly, and fixed pretty close to the wall. All pruning should be finished as soon as possible.

We made a sowing of *Celery* in the open air; the first sowing was made in a hotbed for the earliest crop. In our light gravelly soil the first sowing, which is generally made under a glass light, runs to seed to a large extent during the summer months. We have also been planting out *Onions* that were sown in autumn. In many gardens the spring-sown *Onions* are annually attacked by the grub, and the crop much damaged, or even totally destroyed. When this is the case, the best mode is to sow in autumn, and plant-out in rows or beds in February. In this way there is no danger of the crop being destroyed or even much injured by the worm.

**Parsnips and Carrots.**—We sowed the former. This vegetable is grown and appreciated in the neighbourhood of London, but in Scotland it is little known amongst the poorer class. The cottagers have their beds of *Onions*, *Carrots*, *Leeks*, and *Cabbages*, but wholesome salads and a nutritious vegetable like the Parsnip should find a place in all gardens. The best Parsnips are obtained from ground that has been trenched in the autumn, and the manure placed a foot below the surface. It may also be as well to state that where Carrots have been annually destroyed by the worm when the ground was dug in the usual manner, a sound crop has been obtained by following the above practice. Those who cannot obtain Carrots free from the worm would do well to try this system. Proceed in this way: At one end of the quarter to be trenched take out an opening 1 foot 6 inches deep and 2 feet 6 inches wide, this is to be wheeled to the extreme end to fill up the last trench; mark-off a space close to the opening 2 feet wide; take the top spit of this and throw into the opening; the loose earth must also be shovelled in, this will take 6 inches from the surface. A good dressing of manure must now be put in, and the bottom soil thrown out on the top.

Where Radishes are through the ground a light covering of

straw should be thrown over them when there are any signs of frost. Earth-up early Cabbages.

#### FRUIT AND FORCING HOUSES.

**Vineries.**—In our early houses we have been tying and training the growing shoots. The growth of the Vine is very rapid, and a few days of inattention now might lead to results that could not be remedied during the whole of the season. All leading growths are trained where they will not be too much shaded by the leaves of the laterals; these are stopped two eyes beyond the bunch as soon as possible. The young growths must also be carefully handled; if they are bent down too much at one time, they will either snap off during the operation or the following night. With care the growths may be trained into any position, and all of them should be brought underneath the wires. Some sorts of Vines are more difficult to train than others; those with gross wood are easily damaged. Of this description Golden Champion may be taken as one. A person who did not know its character, and who would train it as he did a Black Hamburgh, would find a number of the best varieties broken-off in the morning. A good supply of atmospheric moisture must be kept up, but saturation must be avoided. Damp the paths, walls, and borders twice a-day, and oftener if the sun is powerful; shut-up as early as possible in the afternoon, and keep the night temperature about 65°. If the weather is mild the Muscat house may rise to 70°, but do not try to get up to this if the days are cloudy and the nights cold. When there is little sun at this season, forcing houses require as much firing by day as at night. It is a common mistake with young gardeners to act contrary to this. They start their fires in the afternoon to get-up the heat; and in the morning, if the heat in the house is all right, it is a common practice to bank-up the fires for the day. This answers very well if there is a chance of sunshine. In dull weather the fires must be maintained.

**Peach House.**—In the earliest house, if the fruit is set, it will not be necessary to be so very cautious in regard to atmospheric moisture. The trees should be thoroughly syringed every day: at present this is best done in the morning. A portion of the fruit should be thinned out, but too much should not be taken off the trees at one time. It is as well to make three thinnings, and the same in regard to disbudding. If too large a portion of the growing wood or leaves is removed from a Peach tree or Vine that is being forced, it tends considerably to paralyse the functions of the tree. Many Peach-growers leave a large portion of the fruit to be thinned-out during stoning, but if the trees are in good health and not overburdened with fruit there is no danger of its dropping off at that time.

**Orchard Houses** that are not furnished with a heating apparatus should be freely aired, so that the trees may be kept in a backward condition. The later they are in flowering the less danger will there be of the blossoms being damaged by frosts. If the trees are in pots they will not require water once a-week, but it is well to look over them as often as this, and water those that require it. If the trees were infested with aphids last season, even though none can be seen now, it will be as well to give the house a good fumigation with tobacco smoke. This pest begins to increase when the trees are in flower, and it is better to kill it before the trees are so far advanced.

#### STOVE AND GREENHOUSE.

It has been necessary to make a re-arrangement in the stove: some Orchids which are wintered in a drier and cooler house have now been removed hither. Orchids, Ferns, and some other plants have been repotted. Lycopods are also found useful in the stove for placing near the edge of the staging to hide other plants; to be kept in the best health they require frequent potting. One of the commonest but most useful is *Selaginella denticulata*, and the variety having the growths tipped with white is very pretty. *S. apoda* is a neat species, and one of the prettiest trailing species is *S. cæsia*. Many of the species are very elegant grown in large pots, and they make very handsome specimens indeed. Of these the best are *Selaginella africana*, *formosa*, *Lobbi*, *Lyalli*, *Walliehi*, *Warszewiczii*, and *Wildenovi*. The last-named is a very neat-growing pretty species, which does well in a greenhouse.

Any hardwooded plants requiring training should be attended to at once. The same remark applies to greenhouse plants of a similar character. The temperature of the greenhouse and conservatory should be warmer, presuming that the houses contain forced flowers. During the recent cutting east winds much attention has been required to keep up a proper temperature to suit the different occupants. Hardwooded plants are apt to suffer if air is not admitted freely; and stage *Pelargoniums* become a prey to green fly in a close atmosphere. It has been necessary to fumigate for this. Where a continuous display of flowers is required, it is necessary to remove fresh batches of all the different sorts of spring-flowering plants and bulbs to the forcing house once in two or three weeks. Such subjects as *Hyacinths* and *Roses* should be placed near the glass, though all plants should have as much light as possible at this season. Stage *Pelargoniums* have been potted into their flowering pots.

Turfy loam, leaf mould, rotted manure, and some bone dust were the potting material used; the plants not being intended for specimens, but to produce good trusses of flowers, the shoots have not been stopped nor tied down.

#### FLOWER GARDEN.

We had pruned a large portion of the *Roses* before the frost, the remainder have been finished since. The ground has been well manured, and is to be forked over as soon as convenient. *Phloxes* may now be planted. Plants from cuttings struck early last season, and which flowered in pots in the autumn, are the best, the spikes being much stronger than when division of the roots is resorted to in order to increase the stock. The *Phlox* is a gross feeder, and luxuriates in deeply trenched soil that has been highly manured. We have a good stock of all bedding plants except *Alternanthera amœna*; this is the prettiest of all, and at the same time the most difficult to grow. If there is a scarcity of it the plants should be in heat, and cuttings should be taken off as fast as they can be procured.—J. DOUGLAS.

#### TRADE CATALOGUE RECEIVED.

E. G. Henderson & Son, Wellington Road, St. John's Wood, London, N.W.—*Catalogue of Flower, Vegetable, and Agricultural Seeds.*

#### TO CORRESPONDENTS.

\* \* We request that no one will write privately to any of the correspondents of the "Journal of Horticulture, Cottage Gardener, and Country Gentleman." By so doing they are subjected to unjustifiable trouble and expense. All communications should therefore be addressed solely to *The Editors of the Journal of Horticulture, &c.*, 171, Fleet Street, London, E.C.

We also request that correspondents will not mix up on the same sheet questions relating to Gardening and those on Poultry and Bee subjects, if they expect to get them answered promptly and conveniently, but write them on separate communications. Also never to send more than two or three questions at once.

N.B.—Many questions must remain unanswered until next week.

**PERSONALITIES.**—It is only from courtesy to our correspondent "AN OLD SUBSCRIBER," who has sent us an extract from our Irish gardening contemporary containing one of the strictures alluded to by "A WELL-WISHER" a week or two ago, that we again make any reference to the subject. It is really too contemptible to take any notice of. The only allowance we can make for "the strictures" is, that they must have been written by some half-educated person who cannot appreciate the writings of gentlemen, and we can but pity him. He, like many of that class, like to have everything reduced to their own standard, which is a very low one; but that would not suit the readers of this Journal. We cannot allude to this subject any more.

**BOOKS (D. R. C.).**—"The Orchid Manual." You can have it free by post from our office if you enclose thirty-two postage stamps with your address.

**CHRISTMAS ROSE (W. L.).**—You had better advertise if you require a quantity.

**STOVE (A Constant Reader).**—We do not know it, and not one is admissible among plants that has not a smoke-flue.

**PRUNING PEACH TREES (C. S.).**—Shoots that have only a small portion of young wood at the point of a long shoot or branch ought to be cut out, and their place taken by younger and more vigorous shoots. The main branches of the tree should be about a foot apart, and from these a young bearing shoot should be trained in at every foot, and if more than a foot long they should be shortened to that length, but if strong they may be left at their full length. We always, however, shorten ours to as near a foot as we find a wood bud. Full instructions for pruning Peach trees are given in the "Modern Peach Pruner," which you may have by post from our office for 3s. 8d.

**EPHARIS AMAZONICA IN GLASS CASE (R. R.).**—It would grow well in a heated case, but we fear would not flower unless you were to remove it for a few weeks in summer, or even place it in a window so as to induce rest; after about six weeks it might be returned to the case, and would probably flower. The time to remove it would be when it had made a good growth, and the leaves were full-sized, the plant appearing stationary as regards growth. Plants may be obtained of any of the principal nurserymen.

**GERANIUMS GROWING (Biceps).**—The Geraniums are starting into growth from the warmth, and would be better removed to a cooler place, the cooler the better, if safe from frost. Place them where they will have light. Cut away all the long straggling horn-like shoots to within an inch of their base. There is no doubt the plants will be much injured by the warmth and premature growth, but by giving them a lighter and cooler position it is likely they will recover.

**SALT FOR GARDEN (Idem).**—You may beneficially apply the salt to your kitchen garden ground in March, scattering it evenly over the surface, but not upon growing plants, though it may be distributed between the rows and about the plants, at the rate of twenty bushels per acre.

**PEAR TREE GRUB-EATEN (Idem).**—From your description we think the "worm" in the trunk of your Pear tree is the larva of the goat moth. The caterpillar should be destroyed by thrusting a wire up the hole, even if it be necessary to enlarge the hole to get at it. It has been found that chloroform closed in the hole destroys the caterpillar, and no doubt linseed oil injected would do the same. Tobacco smoke blown in has also been found useful.

**HYACINTHS IN GLASSES ROOTLESS (Idem).**—Probably the want of roots is a result of the glasses being in too strong light. Cover them with paper just level with the roots downwards, and we think you will find the roots will

descend. Keep the water sweet, and continue the bits of charcoal, taking care that the water is of the same temperature as the room.

**VERONICA SALICIFOLIA CULTURE** (*Birdie*).—This is the name of the plant of which you sent us a specimen. It is a half-hardy evergreen shrub, and requires to be grown in a greenhouse, though it will succeed very well outdoors in summer. It is increased by cuttings of the growing shoots taken off with two joints, and the growing points inserted in sandy soil up to the second joint, the leaves being removed below the lowest joint. Place the cuttings in a gentle bottom heat. To keep it dwarf and bushy, cut it down in spring, and keep it stopped, so as to induce side shoots. The best plants are those from cuttings stopped until a good-habited bushy plant is formed; then allow it to grow for flowering. It will not bloom well if kept very closely stopped.

**CONTINUOUS SUCCESSION OF FLOWERS** (*Idem*).—*Chrysanthemum* from October to January inclusive, *Fuchsias* from May to October, and *Primulas* from October to May. These are the times when they are usually in flower; and though they may be bloomed at other seasons, it is not desirable, as the flowering is not satisfactory.

**VINE FOR CUCUMBER HOUSE—ORCHIDS** (*Idem*).—We do not consider a Cucumber house suitable for Vines, but the kind that would do best in winter along with the Cucumbers is the Black Hamburg. Orchids succeed well in a Cucumber house, as *Arcides falcatus*, *Odontium maximum*, *Lobelia*, *Augraea sesquipedale*, *Cattleya superba*, *Cypripedium barbatum*, *superbum*, *C. hirsutissimum*, *C. villorum*, *Dendrobium chrysotoxum*, *P. densiflorum album*, *D. Farneri*, *D. macrophyllum*, *Dayanum*, *D. Pirardii*, *Phalenopsis amabilis*, *P. grandiflora*, *P. grandiflora superba*, *P. Schilleriana*, *Saccolabium guttatum giganteum*, *S. retusum*, *S. Blumei*, *Dayanum*, *Vanda gigantea*, *V. insignis*, *V. suavis*, and *V. violacea*.

**CAMELLIA LEAVES UNHEALTHY** (*Gardener*).—The leaves are probably in this condition from having been exposed to powerful sun when the plants were making fresh growth. Slight shade from bright sun is necessary during summer. With this the foliage will, we think, be all right another season; but we should advise you to see to the roots, making the drainage good, and potting if required; or remove the surface soil down to the roots, and topdress with fresh soil. In doing so be careful not to injure the roots.

**POTATO PLANTING** (*F. E. T.*).—Plant early in next month during dry weather. We prefer medium-sized tubers for planting, cutting off the crown or cluster of eyes at the end only. If the tubers are large we prefer cutting them in halves, and leaving two or three eyes in each half. Using small sets is a great mistake. In storing seed Potatoes, it is of no consequence whether the eyes are upwards or downwards. Store in a cold place to prevent the eyes emitting long shoots before planting time.

**HAND-DRILL** (*J. H. L.*).—Drilling, as you say, is a difficult operation for an unskilled amateur. A very simple, and at the same time a very expeditious and effective mode of planting small seeds, is to put them in a wine bottle, with a quill inserted in the cork, as shown in the cut. If the seeds are extremely small, and it is necessary to sow them thinly, mix the seed with dry sand before it is put in the bottle.

**TREES OVERSHADOWING** (*R. H. D.*).—The usual course is to give notice to the owner of the trees of the injury they occasion, and ask him to remove the branches overhanging your garden. If he neglects doing so, then usually you might cut them off; but there are many facts of which we know nothing, and which may control your right, so you had better consult your solicitor.

**EPACRIS AND AZALEAS DYING** (*R. S.*).—Probably the plants have gone off from having been in small pots and pot-bound, and then shifted into larger pots, or the soil may have been unsuitable. "Black soil" does not sound well. It may have been bog soil, which does not suit these plants. Sandy fibrous brown peat is necessary, and in shifting from small pots the shift should not be large; the sides of the ball should be loosened with a pointed piece of wood, and the neck or collar of the plants kept high in the centre of the pots, or level with the rim, and the soil should fall gradually, so as to be about half an inch below the rim of the pot.

**FORCING ONE-YEAR-OLD SEA-KALE** (*Rus*).—The seed should be sown in March, or, if the ground is then wet and cold, early in April, in drills a foot apart and an inch deep, placing the seeds about an inch from each other in the drills, and covering with fine soil. The plants should be thinned so that they may stand 6 inches apart, and be kept clear of weeds. They will by autumn be nice plants, and should be taken up when the leaves have fallen, and be placed in pots or boxes to be removed to a dark place where there is gentle heat. If you wish to force on the ground it will be necessary to sow in holes about an inch deep, and in a circle about 4 inches across, putting in the seeds about an inch apart. Four of the best plants may be left to form a stool. The stools should be 18 inches apart and 2 feet from each other in the row, allowing twice the latter distance between every two rows, so as to force two rows at a time.

**ROSE PRUNING** (*Idem*).—Your Roses will have their young growths cut by the recent frosts. Cut them back now to within three or four eyes of their base, or to eyes that have not started into growth. Any strong shoots may be left a little longer, and weak shoots should be cut-in to one or two eyes.

**ANNUALS FOR CROQUET GROUND** (*Potter*).—You could not improve on the pink and white varieties of *Saponaria calabrica*, the seed being sown in March or early in April amongst the bulbs, which will not be injured by the *Saponaria*, but the latter may suffer if the bulbs cover the ground densely. The leaves and stems of the bulbs should be removed as they die off. For the boxes annuals will answer, and they are less expensive than plants. Sweet Alyssum, white; *Abrouia umbellata*, rosy blue; *Gypsophila muralis*, pink; *Sauvitalia procumbens flore-pleno*, yellow; *Lobelia speciosa*, blue; and *Mignonette*. For covering the sides, *Maurandia Barclayana*, purple, and its white variety, are good, and may be raised from seed; but all the annuals named will hang over, and so cover the sides of the boxes. A few hardy plants for the garden are *Achillea umbellata*, *Alyssum saxatile*, *Anubria Campbelli*, *Campanula floribunda*, *Delphinium Barlowii*, *Draba aizoon*, *Helianthus niger*, *Heimericallis Kwano flore-pleno*, *Hepatica angulosa*, *Heris semperflorens*, *Lythrum grandiflorum*, *Myosotis dissitiflora*, *Oenothera macrocarpa*, *Papaver nudicaule*, *Phlox verna*, *Potentilla Menziesii*, *Saxifraga longifolia*, *Spiraea japonica*, *S. palmata*, *Statice latifolia*, and *Veronica taurica*.

**BEDDING PLANTS FOR TRICOLOR FLAG** (*Alpha*).—The best representation we have seen was *Scarlet Geranium*, *Payne's Perpetual*; white, *Centauria racemosa compacta*; and blue, *Lobelia speciosa*.

**FERNS FOR GREENHOUSE—DOUBLE RED AND WHITE GERANIUMS** (*L. A.*).—A few Ferns are *Acrophorus hispidus*, *Anemidictyon phyllitidis*, *Adiantum Capillus-Veneris*, *A. athiopisum*, *A. cuneatum*, *A. scutulosum*, *Asplenium bulbiferum*, *A. dimorphum*, *Blechnum occidentale*, *Cheilanthes elegans*, *Davallia canariensis*, *D. dissecta*, *Lactuca acuminata*, *L. glabella*, *Lomaria gibba*, *L. L'Herminieri*, *Nephrodium molle* and var. *eorymbiferum*, *Nephrolepis exaltata*, *Onychium japonicum*, *Platycerium alcockianum*, *P. rotundifolium*, *Pteris cretica albo-lineata*, *P. serrulata* and var. *crispata*, *P. tremula*, and *P. nimbrosa*. Of Lycopods: *Selaginella denticulata*, *formosa*, and *Wildei*. Full particulars of treatment are given in "The Greenhouse," which you may have free by post from our office for 10d. Double red Geraniums are *Lucinde* de Fontenay, *Victor Lemoine*, *Goliath*, *Wilhelm Pfitzer*, *Gambetta*, and *Princess Teck*. White doubles are *Album plenum*, *Alice Cronise* (this has a salmon centre), and *Aline Sisley*. The double-flowered are more durable for cut flowers than single.

**BLUE TITMOUSE EATING PEAS** (*J. W. L.*).—There is no means of preventing these birds from taking Peas but to destroy them, which is a great pity, as for the greater part of the year they live on insects, and it is only a short time they do harm, generally when they have young. Peas for a succession are *Sangster's No. 1* for present sowing, and at the same time *Alpha*, then at fortnightly or three-weeks intervals *Maclean's Dwarf Proflie*, *Wonderful*, *Veitch's Perfection*, and *Premier* up to *Jane*, and in that month two sowings of *Ne Plus Ultra* and *Premier*. *Snow's Winter Broccoli*, to come in during November, should have the seed sown early in March.

**ERICA CAVENDISHII PRUNING** (*Idem*).—It requires no pruning beyond shortening irregular growth, so as to form an evenly-balanced specimen. This should be immediately after flowering, and the old flowers ought to be removed directly the flowering is over.

**DESTROYING ANTS** (*Alpha*).—The best means of destroying them is to place small pieces of beetle poison, about the size of a pea, on a piece of slate in their runs, taking care that no domestic animal partakes of it. Another good plan is to get two pieces of sponge, dry and clean, and on two sides smear them with honey; place those two sides together, and put the pieces in the haunts of the ants, which will pass into the sponge, and may be immersed in boiling water. It answers nearly as well to dredge the sponge with powdered loaf sugar. The sponges having been washed clean and dried, may be used again and again. Ants are also fond of olive oil; this, placed about 1½ inch deep, in jam pots put in their runs, will take them in great numbers, and may be left until rancid; then the pots should be thoroughly cleaned and renewed with oil. The best salad oil should be used.

**CORN SALAD** (*D. L.*).—The Broad-leaved Italian is the best variety, and to have it in winter a sowing should be made about the second week in August, and again at the beginning of September. Sow in light rich soil and in a sheltered position, watering if the weather be dry. It is best sown in drills about 6 inches apart. Stir the ground frequently between the rows, and if the plants are too close together thin them out to an inch apart, further thinning as required for use to 4 inches, and these will give a succession of leaves. These should be taken off as for Spinach. In severe weather a protection of mats or other covering should be put on.

**STOVE PLANTS FOR JULY AND AUGUST** (*A Three-years Subscriber*).—We presume the *Allamanda* has been kept dry. We should now repot it, removing most of the old soil, and return it to the same pot or one of a size that will hold the roots properly, placing the plant in bottom heat if you have it. The shoots should be tied down, so as to induce them to break regularly, and as the pot becomes full of roots shift the plant into one at least 2 inches larger. The shoots should be tied to a trellis, about which you must exercise your own judgment. Water moderately at first, but increase the amount as the plant grows more freely, maintaining a moist atmosphere. The *Bougainvillea* should have similar treatment to the *Allamanda*. The *Ixora* you will need to keep back—rather dry and cool until May, and then you may encourage growth by a brisk heat and moist atmosphere. *Stephanotis floribunda* you will also need to keep cool and dry until the beginning of June, then place in heat and moisture. The *Ixoras*, if not specimens, may be placed in bottom heat now and growth encouraged, then repot, and after they have made a good growth gradually reduce the moisture; about the middle of June return to moisture and a brisk heat, and you may have them in flower at the time wished for.

**GARDENER EMIGRATING** (*A Journeyman Gardener*).—We never recommend any place for emigration, so much depends on the character, &c., of the emigrant. We know that gardeners who have gone to Victoria are very thriving.

**NAMES OF FRUITS** (*T. V.*).—The Apple, *Shepherd's Fame*, is described in Hogg's "British Pomology" as a large, obtuse, ovate fruit of a pale straw colour, with broken patches of crimson on the shaded side, streaked with yellow and crimson on the side next the sun. The flesh is yellowish, soft, and tender, sweet and briskly flavoured. In use from October to March.

**NAMES OF PLANTS** (*C. S. W.*).—1, An *Echeveria*; 2, Indeterminate; 5, *Alyssum maritimum variegatum*; 6, *Peiza coccinea*. Very bad specimens. (*M. S. H.*).—*Nicotiana undulata*. (*J. Huish*).—*Sparmannia africana*. (*Constant Reader*).—An *Echeveria*, but we cannot determine the species. (*T. Turner*).—Your Orchid was too shrivelled for determination; it is probably a *Phreatophyllis* or *Stelis*. (—*Name mislaid*).—*Ischrochra grandiflora* (?) Bot. Mag. t. 5361. (*Frile*).—*Aspidium triangulum*. (*F. W. H.*).—1, *Gymnogramma ochracea*; 2, *G. L'Herminieri*; 3, Indeterminate. (*W. A. E.*).—We cannot name plants from leaves only.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### OBJECTING TO JUDGES.

I WRITE to bring before the fancy matter which concerns their interests most vitally, and especially now, when the cry arises on all sides for more judges; the proceedings I wish to expose being directly calculated to render the supply of those we already have deficient, and that in a manner, I think, most despicable. It appears to be the practice of a few individuals "who I have been led to understand act in a certain degree in

concert," to send their entries subject to a condition that if a judge officiates whom they will pick out, their entries are to be returned. Now, at first sight it may appear nothing unreasonable that anyone should exercise an undoubted right either to keep his birds at home or only show them under certain conditions; but let us see how this system of protest, as at present carried on, may—nay, even does, work. By way of illustration we will suppose half-a-dozen fanciers make up their minds to exclude a certain judge, A, B, or C, the entries (probably increased to some extent) are sent in by each subject to the condition named, that, say, Mr. A does not judge. We know the anxiety of all active promoters of shows to secure a good entry, and need not wonder the result is in nearly every case, that as they have other choice the judge named is passed over; a reflection is cast upon his character and an injury done, he knowing neither his transducers nor being able to meet any charge. It will thus appear that a combination of but a few fanciers could influence, or rather almost destroy, the prospects of any judge as a judge. This I know has been done, and done without justice or valid reason, in more cases than one, and I think this sufficient excuse for my writing, because if rings or cliques of this description increase true fanciers will fear—*RESPICERE AD FINEM*.

### BRIDGNORTH POULTRY SHOW.

FOR the sake of other exhibitors of poultry I think it only right to make known, through the pages of THE JOURNAL OF HORTICULTURE, the treatment my poultry have received from the Committee of the Bridgnorth Show. The Show took place on the 21st and 22nd of January. On the 20th I sent sixteen pens of different kinds over in my own cart, the same conveniences being sent to bring them back on the 23rd. Only eleven pens were returned, and the man was told that "the Turkeys were sold." Hearing nothing more I concluded the other pens were also sold; and it was only on Wednesday last, February 11th, three weeks afterwards, that I heard from the Secretary "that some of the fowls had been sent by rail by mistake; they are still here being well taken care of." I was requested by him to send for them; this I did on Thursday, the 12th of February, and the fowls (valuable Dorkings of different kinds, three hens and a cockerel) were seen by the man who went for them running in a yard with Brahmas, Cochins, &c. The explanation given me by the Secretary of this delay is as follows:—"We have been so much engaged the last fortnight in this hurried election, we have not been able to attend to anything." Surely the writing on a post card the request that the cart might be sent from this place to Bridgnorth (eight miles distant) would not have taken very much time, even in the midst of a hurried election, and I should not have been deprived of my fowls for three weeks.—*AUGUSTA DARTMOUTH, Patshull, Albrighton, Wolverhampton.*

### PRODUCTION OF EGGS.

I WRITE to let you know the success that has attended my management learned from your Journal. I there first saw that ground oats are a nourishing food for fowls in cold weather and to bring them on to lay. During the month of November I fed them on the oats (scalded), with maize and barley, twice a-day. I have fifty-four stock poultry, including cocks; they are Houdans and Brahmas. The Brahma pullets commenced laying early in December, in which month I had 286 eggs; others coming on increased the number in January to 363; to-day (the 14th of February) I have 239, the produce of fourteen days. So you see there is still a great increase. I have had several hens that wanted to sit, which I have shut-up in the dark for two days; they then come on to lay again in less than a fortnight. They have an unlimited grass run every other day, the Houdans out one day the Brahmas another, as I keep them apart.—*G. L.*

### SUPPLY OF POULTRY-SHOW LABELS.

MAY I call your attention and that of poultry-show secretaries to a matter of no slight importance to exhibitors—that is, the posting of labels? I have the fortune, or misfortune, to live in a rugged mountainous land called "Wild Wales," where postal deliveries and trains are few and far between; and in addition to this, I am six miles from either post office or station. Now, six times in seven weeks have labels not been sent in time, and in three cases not at all. When they are sent they arrive often not more than from seven to eight hours before the birds should be delivered at the show; and when amongst the aggressors one finds the names of Newport, Wolverhampton, and Hanley, it is all time that this should be remedied.—*MADOC.*

SCHEDULE OF THE NORTHAMPTON SHOW.—I wish to call attention to the liberality of the Committee in providing so many cups and other prizes for so large a number of classes. In the Pouter classes more particularly there are no less than eighteen

prizes, two of which are silver cups [one to be awarded to the best cock, the other to the best hen]. This, I think, ought to secure strong competition and induce numerous entries of these majestic birds, especially as they are to be judged by Mr. F. Gresham.—*A POULTRY AND PIGEON FANCIER.*

### BARROW POULTRY SHOW.

THIS was held on the 13th and 14th instant. There were upwards of six hundred entries, among which the following awards were distributed:—

**GAME.**—Cock.—1, Miss M. J. Nelson, Cockshaw, Hexham. 2, T. Mason, Lancaster. 3, J. & A. McKay, Borehead.  
**GAME.**—Chickens.—Cup, T. Mason. 2 and *vice*, W. Boulton, Dalton. *he*, J. Brough, Carlisle; Miss Lister, Stokeley.  
**GAME.**—Chickens.—1, C. H. Wolf, Hale, Altrincham. 2 and 3, W. Boulton. *he*, D. Gibson, Borehead.  
**GAME BANTAM.**—Cock.—1 and 3, Mrs. G. Hall, Kendal. 2, T. Barker, Hill End, Burnley. *he*, Miss M. J. Nelson; Mrs. W. Laycock, Sedgwick; M. Leno, Markyate Street.  
**SELLING CLASS.**—1, G. C. Wilson, Dallam Tower. 2, W. Whitworth, jun., Longsight. 3, E. Smith, Passmans, Rochdale. 4, J. Leeming, Broughton. *he*, W. H. Crabtree, Levenshulme; T. W. Finch, Fulwood; T. Davidson, Egremont; J. & G. Weeks, Bootle; L. Casson, Weiston.  
**SPANGLED.**—Black.—1, J. Leeming. 2 and 3, C. R. Ray. *he*, H. Wilkinson, Earby.  
**DORKINGS.**—1, J. Walker, Rochdale. 2, D. Gibson. 3, J. White, Warlaby. *he*, W. Jackson, Bolton le Sands.  
**GAME.**—Black-breasted and other Reds.—Cup, T. Mason. 2, G. C. Wilson. 3, H. Sharp, Shelf, Halifax. *he*, J. H. Wilson, St. Bees. 4, J. H. Mackereith, Holborn Hill, Cumberland. 5, J. W. Thornton, Bradford. 6, J. W. Brockbank, Kirkstall. *he*, C. H. Bourne, Heston.  
**COCHIN-CHINA.**—Cinnamon and Buff.—Cup, W. H. Crabtree. 2, J. O. Riggs, Ulverston. 3, G. Cartmel, Kendal. *he*, C. J. Myers, Broughton-in-Furness; T. Stretch, Ormskirk. Brown and Partridge.—1 and 3, T. Stretch. 2, T. Aspin, Church. *he*, J. J. Waller, Kendal; W. H. Crabtree. White.—1, J. & T. Weeks. 2 and 3, W. Whitworth.  
**RAHMA POOTRA.**—1 and 2, W. H. Crabtree. 3, A. Bamford, Middleton.  
**HAMBURG.**—Golden-pencilled.—1, R. Dickson, Solkirk. 2, G. & J. Duckworth. 3, J. Anderton, Gilstead. Silver-pencilled.—1, T. Boulton, Handforth. 2, J. Rhodes, Hyndburn, Accrington. 3, W. H. Goddard, Barrow.  
**HAMBURG.**—Golden-spangled.—1, N. Marlow, Denton. 2 and 3, G. & J. Duckworth. *he*, J. Hall, Stacksteads, Manchester; A. Harburn, Bishop Auckland. Silver-spangled.—1, Ashton & Booth, Mottram. 2, H. Stanworth, Burnley. 3, T. Bellman, Ulverston.  
**ANY OTHER VARIETY.**—1, J. Walker. 2, H. Sharp. 3, A. Silvester, Sheffield. *he*, C. J. Myers; R. Hawkins, Seaham; W. Whitworth; W. H. Goddard; T. Marples, Blackburn.  
**BANTAMS.**—Game.—1, J. Heaton, Grantham. 2, Mrs. G. Hall. 3, W. Gray. *he*, Mrs. G. Hall; Miss M. J. Nelson. Game, any other variety.—1, J. Heaton. 2, T. Barker, Baroley. 3, Miss M. J. Nelson. *vice*, Mrs. G. Hall; W. Murray, Hexham. *he*, Miss M. J. Nelson; W. Gray, Tow Law, Darlington. Any other variety except Game.—1, W. Moore. 2, M. Leno. 3, R. H. Ashton. *he*, W. H. Robinson, M. Leno.  
**DOCKS.**—1, J. Walker. 2, W. C. Hunter, Old Barrow. 3, J. W. Brockbank. *he*, J. Walker. 2, E. Gladstone, Broad Green, Liverpool. 3, Miss M. J. Nelson. *he*, R. Gladstone. Any other variety.—1, A. T. Umpleby, Boroughbridge. 2, M. Leno. 3, J. Walker. *he*, R. Gladstone; M. Leno.  
**PIGEONS.**  
**CARRIERS.**—1, J. Thompson, Bingley. 2, D. Garside, Manchester. *he*, W. Jackson.  
**ROUTERS.**—1 and *he*, J. & W. Towerson, Egremont. 2, H. Yardley, Birmingham.  
**TRUMPETERS.**—1, W. Braydon, Dunse. 2, J. Fielding, jun., Rochdale. *he*, H. Yardley; J. Gardner, Preston (2).  
**JACOBIANS.**—1, J. Thompson. 2, W. Braydon. *he*, H. Yardley; J. & W. Towerson; J. Thompson.  
**ANTWERPS.**—1, C. F. Copeman, Rolehull. 2, J. Gardner. *he*, C. E. Peddar, Preston; H. Yardley; J. Gardner.  
**BURNS.**—1, H. Yardley. 2, J. W. Towerson.  
**RENTS.**—1, A. Silvester. 2, J. Wilson, Kignadon, Kirkby Lonsdale. *he*, W. Braydon. 3, Wilson; T. W. Towerson.  
**OWLS.**—1, W. Braydon. 2, J. Gardner. *he*, T. W. Towerson, Bowdon.  
**FANTAILS.**—1, T. W. Towerson. 2, J. Thompson. *he*, W. Braydon; J. F. Lovedge, Newark.  
**DRAGONS.**—1 and *he*, J. Gardner. 2, J. Thompson.  
**TRUMPETERS.**—1 and *he*, J. Gardner. 2, J. & W. Towerson.  
**RENTS.**—1, J. Fisher, Barrow. 2, H. Yardley.  
**ANY OTHER VARIETY.**—1, A. Silvester. 2, J. Gardner. *he*, A. Silvester; C. H. Sharp; J. & W. Towerson (2).  
**SELLING CLASS.**—1, J. & W. Towerson. 2, Miss J. Thompson. *he*, W. Jackson; J. & W. Towerson (2); J. Fisher.  
**CANARIES.**—Male.—1, T. Scully. 2, J. Williams. *Pichard.*—Yellow or Buff.—1 and 2, J. Moffat, Ulverston.

**JUDGES.**—Poultry and Pigeons: Mr. R. Teebay, Fulwood, Preston. Canaries: Mr. J. Boulton, Ulverston.

### HANLEY POULTRY SHOW.

THIS was held on the 10th, 11th, and 12th inst. The following awards were made:—

**DORKINGS.**—Dark.—1, L. Patton. 2, J. Walker. 3, Mrs. Arkwright. Any other variety.—1, Duke of Sutherland. 2, J. Walker. 3, W. Badger.  
**SPANGLED.**—1 and Extra, J. K. Rodbard. 2, R. Newbitt. 3, J. Walker. *he*, Mrs. Alsopp; G. Hurst.  
**COCHINS.**—Cinnamon and Buff.—1 and 3, W. A. Taylor. 2, H. Beldon. *he*, W. A. Burnell. Brown and Partridge-feathered.—1, W. A. Taylor. 2, T. Stretch. 3, Withheld. White.—1, R. S. S. Woodgate. 2, W. A. Burnell. 3, W. Whitworth, jun. Any other variety.—1, J. Walker. 2, H. Frankland. 3, A. Darby.  
**RAHMA POOTRA.**—Dark.—1, Extra, and 2, W. H. Crabtree. 3, Mrs. Arkwright. *he*, W. A. Taylor. Light.—1, W. H. Crabtree. 2, T. A. Dean. 3, J. R. Rodbard.  
**POLISH.**—1, Extra, and 2, H. Beldon. 3, A. W. Crichton.  
**CREVE-COEUR.**—1 and 2, R. B. Wood. 3, J. J. Maldo.  
**HOUDAN.**—1, W. Whitworth, jun. 2, R. B. Wood. 3, J. French.  
**ANY OTHER VARIETY.**—1, T. Marples (Sultans). 2, Rev. A. G. Brooke. 3, H. Beldon. *he*, E. Vickins (Sultans); J. F. Walton (White Malay).  
**GAME.**—Black-breasted Red.—Cock.—1 and Extra, R. Ashley. 2, C. Chaloner. 3, J. A. Fletcher. *he*, C. Chaloner; J. Forsyth. Black Red.—Hen.—1, J. P. Gardener. 2, S. Andrews. 3, W. J. Pope. *he*, E. H. Wood; C. Chaloner.  
**GAME.**—Brown Red.—Cock.—1 and Extra, R. Ashley. 2, Duke of Sutherland,

3, J. R. Fletcher. *he*, G. Lunt. *Hen*.—1, Miss Osborne. 2, J. R. Fletcher. 3, J. F. Walton. *he*, R. Ashley. *c*, E. H. Wood.

**DUCKS.**—*Ducks of other Greys and Blues*.—1 and Extra, D. W. J. Thomas. 2, F. Winwood. 3, R. Ashley. *he*, C. Chaloner; H. Beldon. *Any other variety*.—1, R. Ashley. 2, J. Brasington. 3, Duke of Sutherland.

**HAMBERGERS**.—*Black*.—1, Rev. W. Serjeantson. 2, J. Robinson. 3, H. Maskery. *c*, H. Beldon; Rev. W. Serjeantson.

**HAMBERGERS**.—*Golden-spangled*.—1 and Extra, M. Cashmore. 2, T. Bolton. 3, G. & J. Duckworth. *he*, H. Beldon. *c*, T. Bolton; Duke of Sutherland.

**HAMBERGERS**.—*Silver-spangled*.—1 and Extra, Duke of Sutherland.

**HAMBERGERS**.—*Silver-spangled*.—1 and Extra, Duke of Sutherland.

**BANTAMS**.—*Black-breasted Red*.—1 and Extra, R. Swift. 2, J. Eaton. 3, H. Beldon. *Any other variety*.—1, J. R. Fletcher. 2, C. Pole. 3, R. Ashley.

**BLACK OR WHITE**.—*Clean-legged, not Game*.—1 and Extra, R. A. Ashton. 2, J. Walker. 3, H. Beldon. *Any other variety, not Game*.—1, J. Walker. 2, F. Holbrook. 3, Duke of Sutherland.

**DUCKS**.—*White Aylesbury*.—1, 2, and 3, J. Walker. *Any other variety*.—1, H. B. Smith. 2, Mrs. Arkwright. 3, J. Walker. *he*, E. A. Ridgway; H. B. Smith; Master R. Broughton. *c*, Rev. W. Serjeantson.

**GEES**.—*White*.—1 and 2, J. Walker. *Grey*.—1 and 2, J. Walker.

**TURKEYS**.—1 and 3, J. Walker. 2, Rev. W. J. Hildley. *he*, R. Macalister.

**SELLING CLASSES**.—(*Dorkings, Cochins, Brahmas, Game, Duck, Geese, and Turkeys*).—*Black*.—1 and 2, W. Sowerbutts. 2, G. Anderton. 3, Duke of Sutherland. *he*, J. Walker. 2, Duke of Sutherland. *c*, W. Chell. *Hen*.—1, J. Walker. 2, H. Goodfellow. 3, Rev. F. Dutton. *he*, H. Beldon. *c*, T. A. Dean.

**SELLING CLASSES**.—(*Spanish, Polish, Crève Coeurs, Houdans, Any other variety, Game, Hamburgs, and Bantams*).—*Cock*.—1, Mrs. Cooper. 2, T. Boulton. 3, J. Walker. *he*, M. S. Beighton; R. Newbitt; E. Winwood. *c*, Duke of Sutherland; Rev. W. Serjeantson; J. Mansfield; Mrs. Cooper. *Hen*.—1, J. Walker. 2, Mrs. E. Alsopp. 3, H. Beldon. *he*, J. F. Dizon. *c*, A. T. Waters; M. Cooper.

**SELLING CLASS**.—(*Any Variety*).—1, H. Beldon. 2, E. Jackson. 3, J. Walker. *he*, D. Gellatly. *c*, J. P. Parker; R. Newbitt.

**PIGEONS.**

**CARRIERS**.—1, E. Walker. 2 and *he*, E. Horner.

**POUTERS**.—1 and *he*, E. Horner. 2, H. Yardley.

**DRAGONS**.—1, H. Yardley. 2, H. Gamon. *he*, H. Gamon; G. South. *c*, E. Horner.

**ANTWERPS**.—1, W. Gamon. 2, C. F. Copeman. *he*, W. Gamon; H. Yardley.

**OWLS**.—*English*.—1, J. W. Townson. 2 and *he*, A. Mangnall. *he*, J. Walker; H. Yardley; P. H. Jones. *Any other variety*.—1, P. H. Jones. 2, J. W. Townson. *he*, F. Wild; E. Horner.

**FANTAILS**.—1 and 2, Rev. W. Serjeantson. *he*, F. Loversidge.

**NUNS**.—1, W. Crofts. 2, Rev. A. G. Brooke. *he*, Rev. A. G. Brooke; E. Horner.

**TURBANS**.—1, W. Crofts. 2, P. H. Jones. *he*, W. Crofts; G. Taylor; E. Horner.

**JACOBINS**.—1 and Extra, E. Horner. 2, J. Thompson. *he*, G. South; E. C. Stretch; G. Taylor.

**BARBS**.—1, E. Horner. 2, H. Yardley. *he*, A. Mangnall.

**TUMBLERS**.—1, H. Yardley. 2, G. J. Taylor. *he*, J. Fielding, jun.; E. Horner.

**ANY OTHER VARIETY**.—1 and Extra, P. H. Jones. 2, G. J. Taylor. *he*, H. Yardley; G. J. Taylor (2).

**SELLING CLASS**.—1, R. White. 2, F. Horner.

**RABBITS.**

**LOP-EARED**.—1, Extra, and 2, F. Banks. *he*, T. Hargreaves, jun.; A. Woodall; E. Frost; F. Parser.

**HIMALAYAN**.—1, W. Whitworth. 2, Messrs. Hackett. *he*, Messrs. Leggett; J. Rind; A. R. Hulme; W. Whitworth; C. G. Mason (2); J. Hallas; C. King; J. Tomlinson.

**ANGORA**.—1, W. Whitworth. 2, T. Ball. *he*, H. Sweetman; W. Whitworth.

**ANY OTHER VARIETY**.—1, T. Allen. 2, W. Whitworth. *he*, F. J. Allpress; W. T. Buchanan (2); S. Butterworth.

**CATS.**

**TABBY**.—*Short-haired*.—1, Mrs. W. J. Nichols. 2, G. Ellis.

**TORRIBLESHELL**.—*Colours to be Red, Yellow, and Black, no White*.—1, Mrs. W. J. Nichols. 2, W. Steele.

**BLACK-AND-WHITE**.—*Evenly marked*.—1, J. Upton. 2, F. J. Goodall.

**BLACK-AND-WHITE**.—*To be entirely Black*.—1, Mrs. Brasington. 2, H. Anstlin. *he*, J. Hince; W. L. Scott.

**WHITE**.—*To be entirely White*.—1, T. W. Minton. 2, T. Barber. *he*, G. Hines.

**ANGORA OR PERSIAN**.—1 and Extra, Mrs. Potter. 2, S. Jones. *he*, J. Hince.

**LONG-HAIRED**.—*Black, White, or Tabby*.—1, Mrs. S. A. Poole. 2, A. Adderley.

**HEAVIEST**.—*Any variety or colour*.—1, Mrs. Potter. 2, E. Baxter.

**JUDGES**.—*Poultry*: Rev. G. F. Hodson, Mr. Lowe, and Mr. P. H. Jones. *Pigeons*: Mr. Ridpath. *Rabbits and Cats*: Mr. P. H. Jones.

## CRYSTAL PALACE GREAT EXHIBITION OF

### CANARIES,

#### AND BRITISH AND FOREIGN CAGE BIRDS.

It had so chanced that until Monday last I never had seen "the Palace Canary Show," as it is colloquially called, but I had always wished to be there, especially since one "W. A. B." had written such graphic accounts thereof. I had always thought that the fairy songster of the parlour would be so much in his place in the fairy Palace of glass; and then the pert little rascal is always so much at home wherever he is. Talk of a cat always falling on his legs! puss is nothing to a Canary, who, give him his cage, is at once at his ease and ready to see company. Give him his cage—that is the point, for that is home, his house, his castle; out of it he is but a poor weak-winged flutterer.

I had often seen the Palace Poultry Show, and thought the blithe Bantam more wholly at his ease than the huge Brahma; and that Mrs. Dorking seemed to be dreaming—day-dreaming, with wide-open thoughtful eyes, of the farmyard. Then as to the great Pigeon Show. Although the many-plumaged Doves seemed more at their ease, especially when in pairs (a peculiarity I have noticed also in the human species), yet Mrs. Fan, or Mrs. Jack, or Mrs. Almond might be supposed to have their thoughts upon the nest in the corner of their loft, where their partners murmur sweet sounds of affection into very willing ears. But Mr. Canary, the bachelor "Dick" of thousands of parlours, is quite a cosmopolitan, and with a saucy look of his saucy face, and a wag—no, a jerk, of his saucier tail, looks round at a show as much as to say, "Here I am again, as good as you, only—better."

Climbing the many steps ascending the long sloping wood walks leading up to the Palace, I enter at the extreme west. I

like to enter there, for there I entered some dozen or more years ago, when the Palace was new, and new to me. But I must on inquiry walk right on to the other end. Tramp, tramp, past organ and past theatre. And what now, Mr. Wilson? A pretty tent-like structure ornamented with flags—a roof within a roof, with crimson curtains drawn tastefully back: what meaneth this Arabian-Night-like pavilion? Hark, the song of the birds! Why, here must be the Canary Show! Two grand and grave but gaudy Macaws are at the entrance, guards over the little ones within. The sides are green baize. A line of cages, and above a line of cages; not one on the top of the other, but, with good taste, Mr. Wilson, the top row placed a little backward; then two gangways in the middle, and on either side birds; while with perfect taste Mr. Williams, the head gardener of the interior of the Palace, had introduced here and there masses of flowers, now breaking pleasantly the long line of the cages, then with shrub and statue occupying the centre.

In 1873 the number exhibited was 1063; now, in 1874, the numbers have advanced to 1263.

First, as I enter on the right hand come, on the lower tier, the Clear Yellow Norwich. Now my readers must understand that the Norwich birds are here most properly divided into the usual old variety, and the "high-coloured" birds of the Bemrose-and-Orme manufacture, or I may call them into non-peppered and peppered birds. This is fair and wise, and I hope every exhibitor will honestly enter actually and really non-peppered birds in the non-peppered classes.

Class 1, Clear Yellow Norwich.—Sixty-seven entries and only three prizes! My first feeling is pity for the Judges, for so many were so level in goodness. I would remark, that a capital plan has been adopted by Mr. Wilson to guide the eyes of the spectators. He, Mr. Wilson, hangs up a large card at the ending of a class and the beginning of another, marking-off each class plainly. Hence, testy old gentlemen, white-whiskered and spectated, were not heard so frequently grumbling, "Confound it, I can't make out whatever class I have got to." The Norwich birds ran through the usual courses—Clear Yellow, Clear Buff (N.B.—Please drop that word "buff," good fanciers; "mealy" is surely a better word); then Best-marked or Variegated Yellows and Buffs, and Ticked or Unevenly-marked Yellow and Buff. I looked with pleasure upon many in all these classes. Then I try to keep all these in my mind's eye, and I now pass over to the high-coloured, the peppered, which before I would not purposely look at, and I must own (and mark, I had never seen a peppered bird before), the contrast is wonderful.

"Tis as moonlight unto sunlight,  
And as water unto wine."

Messrs. Bemrose & Orme, or whoever may have discovered this art of feeding, have developed a new colour rather than intensified an old one, and a most splendid colour it is. There hops before one in perfect health a peppered and peppery little gentleman, who looks as if he must, from his plumage, belong to the tropics, and not to our cold climate. We must remember that this colour has come from fair means, and that there has been no painter or dyer at work, and that chemicals were tried in vain. This new colour marks an advance in the fancy. Would that among Almond Tumblers or any Pigeons there could be a like advance. Of course, the "peppered birds" are as yet a minority. One wonders how the little rascals' throats can have borne all the cayenne, when one thinks how we should shrink from a spoonful in a like little quantity of our food. I will defy anyone to imagine the beauty of these birds, sight alone does in this matter. I pass on to that good old variety the Crested, here well represented in all their varieties. Then come the Belgians, birds of peculiar forms and peculiar habits as well. A Belgian's cage should be on high legs for the fancier to be able to scratch or tap at the bottom. This excites Mr. Belgian, who forthwith begins to set-up his shoulders and poke down his head, and present, save to the enthusiastic fancier, a ludicrous picture of deformed curiosity. The pretty London Fancy was well represented, but not numerous, and the birds were, I was pleased to see, entered as "Jonque" and "Mealy." Next came the Lizards, surely one of the very prettiest of the Canary tribe. What cage bird can be prettier than a clear-capped Golden Lizard? with his golden cap on he is set off as none other Canary is. Nor are the sober-liveried Silvers much less pleasing. Would but the Lizard's colour last year after year, he would be as popular as his Clear Norwich brother. For Broken-capped Lizards I have no word of praise, they are like the off-colours in show Pouters. Cinnamons were abundant and good. There were a few, very few, Yorkshire birds, chiefly remarkable for their large size, and coarser shape and look. Among the Any other variety were a few Manchester Coppeys and Green Canaries and others.

Next came some exquisite Goldfinch Mules. Mr. Doel's alone were worth all the journey from Wiltshire to look at. Somehow there is a look and style about his birds which is unapproachable. I believe he never shows anywhere else. His Mealy Goldfinch Mule cock, No. 617, was the most beautiful Mule I ever saw, so evenly marked in eye and wing. Nos. 608,

609, and 618, Mr. Doel's, were also very beautiful. There were besides many Mules which were strikingly handsome, both Light and Dark. There were also three Black Goldfinch Mules, literally black—partly cases of hempsed, doubtless. There was a Bullfinch and Goldfinch Mule, form of the former chiefly, colour of the latter chiefly; Siskin Mules, Greenfinch Mules, &c.

Cages containing six Canaries follow; then come Bullfinches, Goldfinches, Linnets, Siskins, Redpolls, Skylarks, and Robins, Oh! Bobby Robin, I would rather not have seen you caged, though Miss Robinson's cages, cottage-shaped, are neat, warm, and show good taste in make and usually in colour. Blackbirds and Thrushes, Starlings—one, No. 831, seems to be a most talkative gentleman—two Magpies, and one Jay, three Jackdaws, and oh! bad taste, in black cages. Contrast, contrast, good exhibitors, is what is wanted.

Among the Any other variety of British birds were a pair of Bearded Tits, the lady most properly not bearded; a brown cock Blackbird, a good solid brown colour; two Choughs sent by Lady Dorothy Nevill, Bramble Finches, &c.; No. 855, a good collection of British Finches, thirteen varieties; several Snow Buntings, Mealy Linnets, &c., and a pair of Blue Tits in a cage of virgin cork, a most snug-looking abode; a few Blackcaps, and one Nightingale, and he had no tail! So much for the British birds.

#### FOREIGN BIRDS.

These were highly ornamental. Among them glowed Red-headed Cardinals, Australian Parakeets, a most splendid crimson-winged Parrot (No. 924), and a Rosella Parrot (No. 923), these two perhaps the most beautiful of all the larger birds in the Show; King Parrots and Indian Parakeets, and the good old-fashioned African Grey Parrot, as a talker unequalled—these birds are now dear, as none have been imported, owing to Ashantee and other African troubles, for the last two years; Cockatoos of many kinds, looking as if they could say anything if they chose. There were many smaller foreign birds—an Orlolan, suggestive of gourmands; a Solitary Thrush, possibly "the Sparrow that sitteth alone on the housetop" of the Bible; a Mocking Bird, Avadavats, and many others; a Saffron Finch (No. 996), which looked a likely bird to cross with the Canary; and a great crowd of other small foreign birds. There was in addition, and rightly, a large Selling class, so that anyone whose fancy led him to buy could at once carry out his wish.

In conclusion I would strongly recommend a uniformity of cages. At present the rows resembled the houses of most London streets—one tall, the next short; one narrow and high, the next broad and low. Also the cages should be warm, wooden back and sides, and wire front. I was glad that I saw no treadmill cages, and only one poor bird braced round the body and obliged to pull up a little wagon to get food and a bucket to get water; this a mere ingenious piece of cruelty to be reprobated, not praised. All the arrangements reflected the highest credit upon Mr. Wilson, who afforded by this Show pleasure to thousands.—WILTSHIRE RECTOR.

**NORWICH (Clear Yellow).**—1, Bemrose & Orme, Derby. 2 and Extra 3, P. Flexney, Market Street, Caledonian Road, London. 3, W. Walter, Winchester. *chc.* J. Tarr, Thos. S. Tomlin, Calcutta Road, N. P. Flexney (3); J. T. Gale, Colchester; J. Adams, Coventry; Bemrose & Orme; W. Walter; Alden & Havers, Norwich (2); *hc.* J. T. Gale; J. Athersuch & Son (2); J. Bexson, Derby; J. Adams (2); R. B. **SONG THRUSH.**—Prize, A. W. Sweeting. *chc.* W. Walter. C. W. Ireland, Anerley; Mrs. E. Gallo.

**STARLING.**—Prize, T. Dove. *hc.* Miss E. Hawkins, Bear Street, Leicester Square. C. Mrs. Judd; G. & J. Mackley.

**SHAGBIRD.**—Prize, Miss M. A. Robinson.

**JAY.**—Prize, G. & J. Mackley.

**JACKDAW.**—1, Miss M. A. Robinson.

**BRITISH BIRDS (Any other variety).**—Prize, J. Young, Notting Hill (Bearded Tits); J. Pratt (Brown Blackbird); Lady D. Nevill, Dangstien (Chough). *chc.* Rev. T. S. Carte, Torrington Square, W.C. (Finches); E. Martin (Blue Tits); A. Skinner, Islington (Pied House Sparrow, Pied Linnet, and Mealy Linnets). *hc.* Mrs. E. Gallo (Blackcock); Miss M. A. Robinson (Brambling); Mrs. W. Moystyn, Coal-hill (Yellowhammers); Mrs. W. H. Alcorn, London (Pied Goldfinch); J. Drake (Black Bullfinch); W. Walter (Woodlark and Missel Thrush); G. & J. Mackley (Pied Sparrow). C. J. C. Higgs, Leather Lane, E.C. (Hedge Sparrow); Rev. T. S. Carte (Snow Bunting); A. Skinner (Woodlark); T. Newmarch, sen. (Snow Buntings); and G. & J. Mackley (Snow Buntings).

**BIRDS OF PASSAGE AND MIGRATORY BIRDS.**

**BLACKCAP.**—Prize, J. Young. *chc.* C. Varetto (2).

**NIGHTINGALE.**—Prize, G. Coram, Cambridge.

**ANY OTHER VARIETY OF BRITISH BIRDS.**—Prize, C. Varetto (Tidark).

**FOREIGN BIRDS.**

**WIDEB BIRDS.**—Prize, G. & J. Mackley. *hc.* W. Walter.

**CARDINAL (Red).**—Prize, —Prize, —Prize, *chc.* Miss M. Hawkins.

**SCOTCH BIRD (Vernian).**—Prize and *hc.* T. Newmarch, jun.

**WAXBILLS (Any variety).**—Prize and *hc.* W. Walter.

**SPARROWS (Jays).**—Prize, Mrs. Judd. *chc.* C. B. Budd, Clapham. *hc.* T. Newmarch, jun.

SPARE-WR (Coral-necked).—Prize, W. Walter.  
 STERNA (Diamond).—Single.—Prize, W. Walter. c, Mrs. Judd.  
 DOVES (Small).—Prize, Rev. A. Johnson, Horselydown. c, H. Small, Sydenham; — Drake.  
 DOVES (Barbary or King).—Prize and c, J. Leachford, Lower Norwood. hc, H. Small.

LOVE BIRDS.—Prize, W. Walter.  
 PARAKEETS (Australian Grass).—Prize, Miss M. Hawkins. rhc, W. Walter.  
 COCKATEALS.—Prize, Mrs. Miller, Upper Norwood. hc, T. Newmarch, jun.  
 PARROTS OR PARAKEETS (Any other variety of Small).—Prize, Rev. A. Johnson (Turquoise). hc, Mrs. Mostyn, Sydenham (Parrots from St. Edward's Island). c, Miss W. Pope, Sydenham (Senechal Parrots).

PARAKEETS (Australiano or Broad-tailed).—Prize, Mrs. C. E. Sambrook; J. Rawley (Crissal-wing Parrot). hc, T. Newmarch, jun. (Cockateal). c, T. Newmarch, sen. (Mealy Rosella).

PARAKEETS (King-of-the-Indians).—Prize and c, T. Newmarch, jun. rhc, A. Bell. hc, Miss Catt, Brixton.

PARROTS (Kior).—Prize, Master J. S. Harrison, Spalding.  
 PARROTS (Green, or any other variety of large, except Grey).—Prize, Miss W. Pope (Green Eagle-eyed Spectacled Parrot).

PARROTS (Grey).—1, Miss S. Benbow, Wallington. 2, Mrs. Judd. hc, R. Theobald, Brompton Road. c, D. Child, Upper Norwood.

COCKATOO (Any other variety).—Prize, T. Newmarch, jun. (Slender Bill). c, A. Vicars (Forest Hill).

COCKATOO (Leadbecker or Rose-breasted).—1, W. Walter. 2, A. Vicars. c, T. Clapham, Muswell Hill.

COCKATOO (Lemon or Orange-crested).—1, M. George. 2, J. Meredith. c, H. Cross, South Norwood.

ANY OTHER VARIETY.—Prize, Mrs. E. Gallo (Rock Thrush), Equal Prize, Mrs. Riley, Notting Hill (Mocking Bird); J. Cross (Chilian Starling); Miss J. Hawkins (King of the Sparrows); rhc, R. Woolward, jun. East Brixton (South American Magpie); Miss M. Hawkins (Lesser Pekin Nightingale and Greater Pekin Nightingale); T. Newmarch, jun. (Broad-winged Parrot); Rev. A. Johnson (Australian Barwing Doves). hc, Mrs. W. Mostyn (Australian Banded Finch); E. Sweeting (Madagascar Finch); Mrs. F. Ford (Indian Avadavats); Mrs. Judd (Indigo Blue Bird); T. Newmarch, jun. (Spice Birds); W. Walter (Saffron Finch); T. Newmarch, sen. (Bronze Manikins and Avadavats); Rev. A. Johnson. c, Mrs. E. Gallo (Blue Solitary Thrush); T. Newmarch, jun. (Chesnut Finch and White Banded Manikins); J. Newmarch, sen. (Black-headed Manikins and Silver Bille).

JUDGES.—Canaries: G. Barneshy, Esq., A. Willmore, Esq., T. Moore, Esq. British and Foreign Birds: H. Weir, Esq., J. J. Weir, Esq., assisted by F. W. Wilson, Esq.

## BEE-FEEDING EXPERIENCES—REMEDY FOR BEE STINGS.

In October last I bought my first hive of bees—an old-world cottager's hive. Having no experience, and relying entirely on "book-learning," I came to the conclusion that it was "light," and required feeding. I tried troughs outside the hive, but as this method required constant attention to renew the supplies, and attracted robbers of all kinds (where do the hosts of blow-dies come from?), I was compelled to abandon this plan. I then cut a hole in the top of the hive, and applied one of Neighbour's circular troughs with a floating stage; but the cold weather was upon me, and the bees only mounted into it in small numbers; some of these even were chilled, and never returned to the hive. This plan also failed. I then saw that one of your correspondents advised the feeding of light hives in a greenhouse. Evidently it was the very thing for me. The hive, therefore, was duly removed on a memorable Saturday night to my little greenhouse, the food duly placed, and I went to bed as happy as the proverbial sand boy. Well, I admit Sunday is not an early day with me. I was not suffering from bees on the brain, and I slept. My first care was my bees. Oh, horror! The weather, instead of being November, was May; the sun shone brightly, the bees hummed merrily out of the hive, and bumped and thumped against the wet glass. Then they were chilled, and fell by hundreds between my flower pots, and thence on to the colder floor. I gathered up my darlings, warming them in my hands, or in boxes before the fire, before replacing them in the hive. They behaved very well to me, for I was innocent of bee-dress and gloves, and during that seven-hours work, having handled hundreds of bees, I received but two stings—one through having slightly pinched my friend, and one from a vixenish party on the forehead. I had had enough of that, and the bees were that same night relegated to the garden, and invited, in the words of Montalembert, "to take a bath in the free air of England."

But still the bees must be fed, and one of your correspondents suggested the plan of all others that suited my case. He said a light hive might be kept in the kitchen, and fed, if the entrance to the hive were closed. A piece of perforated zinc was accordingly obtained, the entrance carefully barred, and yet fresh air secured.

The hive of much-suffering bees was again removed to the greenhouse—temperature 45°. There they remained a week, carefully watched night and day, feeding but little, and showing signs of anger that they were prisoners. At last one unhappy day, I left home early without looking at them, and returned late at night. To my question, "How are the bees?" I received the reply, "Oh! I forgot to look at them, father." "Then I will. Come on." I raised the woollen covering from the feeding trough, and found it full of one solid mass of drowned and drowning bees. Their weight had forced the float downwards, and they were struggling in the food which I in my fondness had placed for their sustenance. It was evident that something must be done to liberate them, and to-morrow again was Sunday. I took them to the potting board, removed the zinc and the

feeding trough, and out they streamed in hundreds on that memorable December night. There they were left till the morning. I then raised the hive from the floor board, and found it fairly covered with dead bees and a large quantity of honey. On turning the hive up I found about fifty cowed and dispirited bees and seven large combs. About one-half of these were unsealed, and some of the cells contained brood. So ended my first attempt at bee-keeping. We treated our dead bees with all respect, and having held an inquest, we returned the verdict of "killed by kindness."

Since then I have studied Esop, and commend to the perusal of amateur bee-keepers the wise old story of the man and his ass, which means that I shall let my next lot of bees take care of themselves, while I correct my experience by the suggestions of your contributors. If the recital of my failures help to warn others from sunken rocks I shall greatly rejoice. I have made one discovery—that a preparation of *Ledum palustre* (Labrador Tea) homœopathically prepared is a sovereign remedy for bee stings.—BEATEN BUT NOT DISMAYED.

## FOUL BROOD IN HIVES.

It is believed that the late Mr. Woodbury ("DEVONSHIRE BEE-KEEPER") exerted himself more than any other British apiarist to find out the mysteries of this terrible disease. By his own researches and investigations he examined the subject as far as he could. He not only discussed the question in these pages, but translated for their readers long and elaborate papers from German writers on the disease. From the time when he and I became acquainted with each other a very close and friendly correspondence was kept up between us till he died. In looking over a pile of his private letters to me lately, two things struck me forcibly—viz., his loyalty to truth and *THE JOURNAL OF HORTICULTURE*. In all his private and public correspondence I never found that he ever overcoloured or undervalued the opinions of those who differed from him, or ever indulged in personalities. His constant aim was to find truth, and enlighten the readers of this *Journal*. Frequently he begged me to contribute articles to its pages, and once or twice he sent me the proof-sheets of his translations from the German. The views held forth in those papers did not appear to satisfy his inquiring mind, and he asked me for mine on the subject of foul brood. I told him my opinions on this question were not entitled to much respect, for I had not given much time to its investigation; and that all my life I have thought that much of foul brood found in hives has been caused by either improper food or imperfect feeding. The expression of this opinion seemed to give him great pleasure and fresh food for thought; for in a day or two afterwards he wrote me a complimentary letter.

When the reader is informed that, in my opinion, much that has been said and written on the cause of foul brood is simply hypothetical—mere guessing, he will not expect to receive from me much information or dogmatic teaching on the subject. All I shall attempt is to describe the appearance of foul brood, and the course it generally runs.

Foul brood in bee hives is an incurable malady. From some cause, and in some seasons more than others, larvæ or half-hatched bees perish in their cells. These cells are at first separate from each other, and are covered with lids concave in form; the lids of healthy normal brood are convex or rounded. The cells of dead brood multiply fast, and by reason of their numbers come in contact with one another. This disease does not appear to spread by contact or touch, but by the multiplication of cells all over the brood combs. The matter in the cells is of a dirty red colour, as thick as honey, and almost as offensive to the smell as rotten eggs. The matter of foul brood is so putrid and offensive to bees that all prosperity departs from hives in which it is found; indeed the bees of infected hives frequently abandon them, and go off as swarms; sometimes they creep underneath their boards and build their combs there. Of course experienced bee-keepers do not keep diseased hives till they become uninhabitable. The stench of this disease can be easily smelt outside the hive, and symptoms of its existence may be seen in the conduct of the bees.—A. PETTIGREW, *Sale, Cheshire.*

(To be continued.)

## OUR LETTER BOX.

BOOKS (*Subscriber, C. Fold*).—Brent's Canary Book. You can have it free by post from our office if you enclose 19 postage stamps with your address.

NEWCASTLE-UPON-TYNE SHOW (*J. P. Barber*).—No doubt you could recover from the Committee the money for which your birds were sold; but there are too many circumstances needful to be known to justify us in advising you. Consult a solicitor.

KITCHEN SHOW.—Mr. Haines says his Light Brahma cockerel was one that took second prize at Manchester and Bristol.

FARNHAM SHOW.—The following omission occurred in the prize list of this Show—viz, Game, any other variety, Hon.—hc, H. P. Pamel-Price (Pile).

SHELL-LESS AND IMPERFECT EGGS (*J. K. L.*).—It is always considered the hen forms the egg internally, but the shell requires assistance from without. Chalk and lime are materials in request. If such are not to be had in the runs of your poultry, supply them. The easiest and most effectual

method is to throw down a barrowful of bricklayers' rubbish near to their house. Throw it in a heap, it affords them amusement to get what they want. If your fowls have this, and are still in the habit of laying soft eggs, there is something wrong in their secretions. They are out of health. Either their food is at fault, or they lack something necessary for them. Your meagre information will not allow us to guess the cause. Soft food is the best for sitting hens. Creoles are not a distinct breed. Creels are much esteemed in some districts.

**COCHINS AND BRAHMAS (H. Cox).**—Glad to hear of some of our old birds. There are none such now. We never approve of crosses between sitters and non-sitters. We are not very friendly to any crosses, and believe that any reasonable expectations in the way of poultry may be realised with pure birds. We cannot say what the effect of a mixture of Dorking, Houdan, and Brahma would be, nor do we think you would from a sight of the birds. If you mean to cross, confine yourself to Dorking and Brahma. That will give you a good table fowl. We have no doubt you can get the Brahmas pullets you require at 25s. each, but we have left Winchester and are now Londoners. If you run Light and Dark Brahmas together they will do to eat or to make broth, but they will be useless as stock fowls. Judging from your letter we suppose you have two runs. Allot one to your pure Dark Brahmas for one reliable and saleable breed. In the other keep what you like. You must not mix Light Brahmas with White Cochins. You will lose comb, markings, and all that constitute a Light Brahma, while you will get a comb and black feathers in the Cochins that will make them valueless.

**COCKEREL'S FOOT CRUSHED (Dover).**—We should fear the bone is crushed or very seriously damaged. We should poultice while there was the discharge you mention, but as soon as that lessened we should keep the foot bandaged in its proper shape, and dressed with citron ointment. The ball of the foot may be injured by the fowl walking on it. In that case bind three or four splints round the leg, and let them reach half an inch below the foot. The bird will make a bad walk for a time, but if the foot gets well he will soon walk straight.

**BRAHMA PULLETS NOT LAYING (Brahma).**—We expect you will have eggs before you read our answer. For winter layers, pullets should be hatched in May. There is great difference in three months' growth, or in three months' approach to maturity. After June the days shorten, and the sun loses power. People will smile at this, but we will be judged by those who breed for a livelihood all the year round, and will ask them the difference in rearing April or June chickens. We see no fault in your feeding except the buckwheat. That is too fattening. Pullets naturally put on flesh and fat before they begin to lay. When over-fat they cannot lay. Anything that tends to make fat should be avoided.

**HEN DYING SUDDENLY (G. H. L.).**—There is nothing in your description of the dead hen that is inconsistent with "natural death." Such is not uncommon both in cocks and hens at this time of year. Did you find the egg-organs quite healthy? Death is often caused by straining to lay an egg that is impeded by fat.

**FENCE FOR POULTRY-YARD (J. H. T.).**—A 3-foot fence is insufficient to confine a Dorking cock at any time. You may render the exploit much more difficult by cutting all his light feathers down almost to the quill on one wing. Cut them as low as you can without causing bleeding, and cut off ten feathers. Constancy is not a gallinaceous virtue.

**LAYING OBSTRUCTED (F. T. L. T.).**—It is always a difficulty for a pullet to lay her first egg, and Nature seems to have provided it shall always be a very small one, probably the smallest she will ever lay. It is nevertheless voided with difficulty, and is always more or less streaked with blood. The treatment is to lubricate the vent with oil, and to continue till there is a plain action of opening and shutting. When this is seen the feather should be introduced still farther, and this should be repeated till the egg is laid. We never venture on an incision; we consider the ovary the most delicate part of a pullet's body. We see nothing to hinder the bird from laying her eggs and performing all the functions a good hen should do. Hens sometimes suffer in the same way, but that is generally caused by internal fever. The treatment is the same—a wing or tail feather saturated with oil, and introduced till it reaches the egg. No violence must be used, as a broken egg in the egg-passage is a fatal accident. Where the oil is freely used nature will do the rest.

**BREEDING AGE (J. P.).**—Much depends on the time of year at which the bird is hatched. A bird hatched in March, although only seven months old in October, is a stouter and more serviceable bird than one hatched in June will be in the following March. No cock should run with hens till he is six, or, better, seven months old, even if brought into the world under most favourable circumstances. You may safely set the eggs after he has been running four days or a week; the first is long enough if there is hurry. (You may keep twenty-five or thirty fowls.)

**UNITING SWARM AND CAST (A Young Apiarian).**—You will certainly succeed in transferring all the bees from your straw to bar-frame hives by driving all out of the former on the same day as the first swarms leave them, and casting them together in any way you like. Better do it on the day of swarming than leave it for a day or two later, for there is a peculiarity of smell in every colony of bees different from all others; and as bees know each other and strangers by smell, the swarms should be united before they become, as it were, separate families. The day after swarming may answer for the unions to take place, but the sooner it is done the better. There are so many ways of uniting swarms, that we hardly know which to suggest in your case. If you raise the bar-frame hives off their boards by wedges, and throw the bees from the old hives on the flight boards, or put the driven bees down so that they can pass out of the one hive into the other, they will speedily run into the bar-framed hives, and be received by their old comrades. There will be no queens amongst the second lots of bees taken so soon after the first swarms.

**A LARGE SUPER ON TWO HIVES (Idem).**—Two swarms will not work amicably in separate hives in filling a large super. Better have a super on each hive.

**HIVES (A.).**—The hives used by Mr. Pettitrew are made of straw, and are large, and neatly sewn. He uses three sizes—viz., 16, 14, and 20 inches wide inside, all 12 inches deep. He considers them incomparably better for bees than wooden hives, and better as storehouses for honey than straw hives with bar frames, but they are without windows. They are also very much cheaper than any other hive worth using in this country. No better bar-frame hive than Woodbury's can be obtained, for it is made of straw. We do not recommend makers of and dealers in hives. If you wish your supers filled with comb for home use, we would advise you to use these made of straw or wood without bar frames in them. They are not only cheaper with-

out frames, but very much better. Where honey is the object sought, complications in hives and supers should be avoided.

**CLEANING HIVE'S FLOOR-BOARD (W. E. M.).**—The best time of day for cleaning the floor-boards of your hives is early in the afternoon on a still and warm day. We should first of all break the hives from the boards (in bee dress and gloves) with a screwdriver or strong knife; then blow a little smoke (tobacco or brown paper) into the hive to quiet the bees. Then, having ready a new board, gently lift up the hive and place it on the board, which can be put exactly where the hive stood before. The old board can then be scraped and washed with hot water, and given to another hive, and so on through the apiary. The operation need not take more than two or three minutes in the hands of a skilful workman. If done carefully no serious disturbance of the bees can occur.

**ROASTED BIRDS FOR BEES (A. P.).**—You ask for our "readers' opinion as to giving sparrows and blackbirds (roasted) to bees for food," and say that "it is a common practice here in Ireland." You moreover state that "healthy hives with plenty of honey in them relish such food." Your statements are certainly novel to us. We never heard of bees taking to food of this kind; but there is no denying what you say, that, if these are facts, "however ridiculous it may appear, it cannot be nonsense." Still we demur to the "facts." Have you seen the banquet with your own eyes? and can you tell whether the bees devoured bones and all? It may turn out that they merely licked the salt of the butter in which the sparrows were roasted.

**SUITABLE HIVE (A. D.).**—As you cannot devote much time to your bees, and therefore require a simple form of hive, we think you cannot do better than adopt an improved cottage-hive. As the sight of such hives is better than mere description, we will refer you to our "Bee-keeping for the Many," which can be had from our office by payment of five stamps. Any hive-maker in your neighbourhood would construct your hives, if of straw, at a much cheaper rate than you could buy them by advertisement. What you seem to require is a plain flat-topped straw hive, with a hole in its crown and a cap or smaller hive at top. All this can be covered in the usual way with a straw covering, or "hackie," as it is called.

#### REMARKS.

11th.—Very cold, but fair; a fine winter day.  
12th.—Rather thick in the morning, more so at noon, and continuing all day; very much warmer in the evening.  
13th.—Rain for a short time; dull all day, and rain again at night.  
14th.—Windy and boisterous in the fore part of the day and at night, but more calm in the middle of the day.  
15th.—Showery morning; fine afternoon.  
16th.—Rainy morning, and more or less so all day.  
17th.—Wet uncomfortable morning, clearing off soon after noon; very pleasant in the latter part of the day.  
The temperature in all cases except underground and in sun nearly identical with the week before last, and about 10° above that of last week.—G. J. SIMONS.

#### COVENT GARDEN MARKET.—FEBRUARY 18.

THERE is no improvement to notice, the supplies being ample and the general trade very quiet; indeed, the higher class of business which usually prevails in London at this season, is nowhere to be heard of.

From observations taken near London during forty-three years, the average day temperature of the week is 48.5°; and its night temperature 33.1°. The greatest heat was 70°, on the 4th, 1869; and the lowest cold 14° on the 3rd, 1862. The greatest fall of rain was 0.81 inch.

## THE SNOWDROP, AND ITS USES FOR NAKED PLACES.

**T**ome it has always appeared strange that so little attention has been paid to this the earliest of all our spring bulbs, either by those who prepare elaborate catalogues of such things, or by the gardening world in general. The charge of commonness ought not to be an excuse in an age when the Daisy and the Primrose are so much sought after, and yet the Snowdrop has the merit of flowering much earlier than the first of these, and also before the bulk of other bulbs. It has, besides, claims of its own, as differing widely from either of the plants specially named, and being of easier cultivation—in fact it is on the latter account that I now call attention to it. As in an article a year ago I noticed the purposes of arrangement to which the Snowdrop may be put, I need not repeat these here, but will at once endeavour to point out a fresh field to operate upon, and one from which it will not drive away any previous occupant.

The places which I would ornament with this lovely emblem of spring are among the least inviting of the whole area usually set apart for the dressed grounds; or even if outside of the latter it will serve the purpose as well, and the effect will be equally pleasing and agreeable. Near most country residences there are groups of large trees, or it may be a few single deciduous ones, with branches touching the ground, or nearly so, and stretching a long distance in all directions. Some single trees cover as much space as a fair-sized flower garden, affording a delightful shade and retreat in hot summer weather, but the branches are so close that only the very scantiest vegetation is met with on the ground, and this for but a very short time in spring or early summer, when a few weeds present a little greenery, which all disappears before the leaves fall. The ground is then all but naked, in fact often perfectly so, and there being no foliage on the trees the soil is everywhere seen, and the whole is of one hue. Well, it is in such places as this that I would invite the aid of the designer of pretty patterns, for here is ample scope for him, and the material to be dealt with is also simple and convenient. They present the best possible sites for embroidery, and very agreeable and interesting designs may be worked out with Snowdrops, and these when once planted will last for a number of seasons, without any trouble or attention. It is only necessary to look each returning season for the bulbs coming up in the same order as before, somewhat more thickly perhaps, but this is an advantage rather than otherwise; and when eventually (generally not for several years) it is advisable to take them up to restore the design, which may have become too crowded, the extra bulbs will be of service for planting elsewhere. There are few places without some naked unsightly space which a few patches of Snowdrops would render cheerful in midwinter, when there is so little to admire and interest the spectator.

In recommending the above mode of planting Snow-

drops to the consideration of the spring gardener, I may remark that it is only what we have done here with perfect success, and that rows of Snowdrops also line the edges of many of our walks that lead through shrubberies where it is hopeless to expect anything else. Such walks are generally edged with bricks laid diagonally so as to show a ridge-top of 45° each way, and a few inches from this edge we plant a line of Snowdrops, which in all cases have done well. Even when the ground is so hard and full of roots as to be difficult to get them planted deeply enough, they come up year after year with perfect regularity, increasing a little, of course, but not so much as in better ground. Further, I may observe that the time of planting has seldom or never been the most suitable one, for it has often been when the plants were in flower or just coming into bloom; yet so accommodating is the Snowdrop that it rarely succumbs under any bad treatment, so long as its roots are in the ground and the foliage allowed to ripen before being taken off; indeed the dead foliage in such places is seldom objected to. The Snowdrop will also succeed amongst grass in shady places, but the leaves ought not to be cut until they begin to ripen, which in most cases they might be allowed to do when surrounding shrubs. Snowdrops are here extensively planted in this way, and we find that their appearance during the latter part of January, throughout February, and early in March, more than compensates for the little roughness of the grass left as it is growing up to the middle of May; then the foliage is usually so far faded as to be cut without injury. In the case of those planted in the naked ground under deciduous trees, there need be no hurry in cutting, rather let the tops ripen and drop off.

Those having a piece of ground of the kind referred to, and a plentiful supply of bulbs, will find the labour of planting by no means heavy. The most that I have are planted in single rows, forming scrolls, curves, and other figures more or less pleasing; but it is well not to attempt too complex a design, which only confuses the whole, and that no two lines should be nearer each other than 18 inches or more. My plan is merely to scratch the design on the ground with a pointed stick, and run a thin mark of white sand along it, which on the naked ground will give the figure at once, and enable one to judge of its appearance. If approved of, it is only necessary with the spade to notch-out the ground about 2 inches deep, or a little more, lay-in the bulbs of Snowdrops 2 or 3 inches apart, or more if they are scarce, fill-in the ground again, and tread-in; the whole operation being quickly performed, and the ground very little broken. If this be done before the flowering period Snowdrops will bloom pretty well the same season, but will not multiply much till the following year. Snowdrops are easily obtained early in January, and that time seems as good as any other for planting—in fact I do not know any plant more accommodating than this in regard to growing under almost all conditions, and but rarely succumbing, excepting when treated with undue harshness during its growing period; I have seen the plants eaten-off by

rabbits, and still live, although I need hardly say that such treatment is very bad for them.

Occasionally reference has been made to the relative merits of the single and double varieties of the Snowdrop, but if I were to give an opinion it would certainly be in favour of the single one, which is earlier, more free-flowering, and increases more rapidly. In connection with the last-named property I would ask if anyone has managed to obtain bulbs of this plant from seed. Many years ago, having a quantity growing in a situation that appeared to suit them, I had the seed gathered when it appeared ripe, and sowed it at once amongst shrubs, on rough ground in plantations, orchards, &c., expecting that at least a part might vegetate; but I have not been able to trace a single plant to this half-natural sowing, and there was no lack of seed, for nearly a couple of quarts were so thrown about. I did not at the time examine the seed, which I have since thought might be imperfect, yet it had all the appearance of being well matured. The question then arises in my mind, Does the Snowdrop ripen its seeds in this country, or does it not?—J. ROESON.

### MRS. PINCE'S BLACK MUSCAT GRAPE.

THERE is certainly something very mysterious about this Grape, and I am not surprised it has been hinted that there are two varieties under the same name. I do not at all think, however, such is the case. My opinion is that, like many other new things, its constitution was partially ruined by very rapid propagation, and that in course of time it will get all right. I believe I can see signs of improvement in it. It is certainly very desirable it should have a good constitution, for it is the best-flavoured late Grape I am acquainted with. I have this day (February 13th) tasted it in comparison with Lady Downe's and Alicante, and it is far superior in point of flavour; but I am obliged to confess I have not yet been able to grow it satisfactorily, and had almost condemned it before I saw the beautiful examples of it at Chatsworth last autumn, and then I made up my mind to try again.

It may not be known to all of your readers that a Vine when sent out new is sometimes procured early in autumn by the trade, planted and forced into a most unnatural growth in the same season, and from this second growth (which has to be matured as far as it is possible to mature it in the late autumn and early winter months by strong fire heat) hundreds of plants are raised and distributed over the country. It is reasonable to suppose that plants so raised cannot have such a constitution as those raised in a more natural manner, although they may be vigorous and healthy to look at, and no eye can detect the difference. Then, again, see the crowded way in which young Vines are grown in most nurseries, they cannot possibly be all ripened; and remember that unripe eyes will grow as fast as ripe ones. Those not even brown will grow, and make healthy plants to look at, but they cannot be so in reality.

If my theory is right as regards Mrs. Pince, may it not be the same with other new Grapes which have been perhaps too hastily condemned? and some of which were sent out by men who know all that is at present known about Grapes and Grape culture, and whose honour is above the slightest suspicion, yet whose much-lauded productions are at the present time pronounced by the public to be worthless.

It is said that everyone thinks his own geese are swans, but that only holds good of enthusiastic beginners. Practice and daily disappointments such as the most successful gardener always meets with make him able to compare impartially his own productions with those of other people, and I cannot believe but that some of the new things were better before they were grown at express speed for distribution than they have proved to be since that time, or their own raisers would never have allowed them to be distributed.—WILLIAM TAYLOR.

### DIG-UP POTATOES BEFORE RIPE.

I AM glad the inquiry concerning the rubbing off the skin of young Potatoes has been made, as I have inadvertently omitted any mention of it in the papers on this subject. When the Potatoes cease to swell the skin begins to harden or ripen; then, as I have before stated, the crop of such kinds as Victoria may be lifted with perfect success. Never mind about rubbing off portions of the skin, the economy of the tuber will repair all that, and what is of more importance, the quality of the Potato will sustain no harm. I have now about a dozen sacks of Victorias that are as excellent in appearance as they

are in quality, which, when they were taken up on the 14th of last August, were so tender that the skins were very much torn. So also were some Flukes, Regents, and other sorts, and yet all have been good after their kind. I can speak with confidence about this important matter, for I have practised early-lifting most successfully for several years; and had "D., Deal," taken up his Potatoes as he first intended he would not have had to revert to baked Potatoes, as he appears to have done; for, after all, it is the Potato that boils well that is most valuable.

When the early lifting—which I hope to see more generally followed—is practised, it will not answer to throw the tubers in a heap, and then leave them alone. On the contrary, most careful tending in the storehouse is necessary. It will, perhaps, be best to describe the entire process of lifting and storage. On a bright sunny morning the diggers, each with a four-tined steel fork, begin lifting at 6 A.M.; but the collecting does not begin till four hours later, which gives the diggers a good start, so that by the time the Potatoes are put into the sacks the skins are tolerably dry. In taking them to the storehouse due care is to be exercised to handle them as gently as possible. They are spread in layers of about a foot thick, and slightly covered with straw, every window being kept open day and night. Once a-week each layer is examined closely for blighted or rotten tubers. The ripening process still goes on, and when the Potatoes are fully matured—that is to say, when the skin will not rub, they may be stored in much closer compass for the winter.—EDWARD LUCKHURST.

### ROYAL HORTICULTURAL SOCIETY'S COUNTRY SHOWS.

As we were going to press we received from the Secretary of the Royal Horticultural Society copies of a correspondence which has taken place on the presentation of a memorial to the Council regarding the holding of a country show this year, and we have only space for his reply, which will indicate the nature of the correspondence.

"Royal Horticultural Society, South Kensington, S.W.  
"25th February, 1874.

"Messrs. James Veitch & Sons, King's Road, Chelsea, S.W.  
"GENTLEMEN,—In reply to your letter of the 20th inst., the Council, far from having any desire to put a stop to provincial shows, are, on the contrary, most anxious to promote and encourage them.

"Until very recently they were in negotiation with the authorities of an important town on the coast, and of one in Scotland, with a view to holding shows, but without being able to come to any satisfactory arrangement.

"The Council will be most happy to receive proposals or suggestions for a show during the ensuing summer, and will give such proposals their earliest and best consideration.

"I have the honour to be, gentlemen, your obedient servant,  
(Signed) "W. A. LINDSAY, Secretary."

### LEE'S VICTORIA REGINA VIOLET.

MANY inquiries have arisen about my obtaining the Victoria Regina Violet, and in reply I disclaim all merit or skill in its production. The flower was naturally fertilised by the bee or some other insect; the seed was carried by a mouse and deposited, at least 15 yards from where it grew, in a Strawberry bed, and was discovered by me in December, 1871, having grown there a year or more previously. The Victoria Regina could at that time be covered with a dinner plate, and the other plant (Prince Consort), about 15 inches distant, was still smaller. There was, I think, one fully expanded bloom on Prince Consort; others had been, but were past.

Strawberries and weeds were carefully cleared away, a little good soil placed round the plants, and each protected by a hand-light. As the flowers came up they were carefully fertilised; each pod was attentively watched, gathered when matured, and, as I thought, carefully stored. The seeds were sown in the autumn, but not one vegetated.

The following statement gives the order of the origin and progress of the plant:—

Summer of 1870.—Seed sown by a mouse.

Spring of 1871.—Plants probably appeared.

Summer of 1871.—Plants produced summer flowers.

December, 1871.—Plants discovered as narrated above.

Spring of 1872.—Thirty plants sprung-up around the parent plant from flowers of the previous summer.

The summer flowers of 1872 were taken no notice of, or perhaps some hundreds of seeds might have been secured. A few pods were taken from the young plants (these also from summer flowers), and the seed at once sown in a pan; they

produced about sixty plants. But what is remarkable in each case is that the seedlings are so different from each other; indeed many of them are so unlike the parents as to render it quite a matter of dispute whether they could possibly be their progeny.

My earnest hope is to obtain great improvements by carefully selecting seed. What I am most anxious for is to get colour, compact and upright growth, fine foliage, and scent as well as size fit for conservatory decoration.

For example, I have one seedling with the lower petal or lip black, but the petals are very narrow although long, only  $1\frac{1}{2}$  or 2 lines wide, yet I was pleased with it as a parent; and to my great delight some two or three weeks after I had another, although not so dark, yet of good shape and compact growth, properties which the other did not possess. Another seedling I have, although small (not larger than *Devoniensis*), is quite as dark, of upright growth, and as free a bloomer as the old Russian, producing at one time thirty or forty fully expanded flowers on a very small plant. This would also be an addition to our conservatory decorative plants.

How beautiful a plant is The Czar or Giant when well grown, even apart from its flowers. I have two of that habit of growth, with very deep green leaves, quite distinct as to the darkness of the foliage, and having large deep blue flowers of good shape. They are likely to be useful as parents, at least I have every hope they will prove so. Prince Consort also is of very handsome growth, darker green in leaf than The Czar, and of fine upright growth. This I intended sending out at the close of this year; but the demand for gathered flowers is so great that, instead of doing so, I purpose planting them as well as large numbers of *Victoria Regina*.

I gather from my present experience that there will be a great demand for these flowers in the large cities and towns of the United Kingdom. They have only to be known to be appreciated. Even the working classes give them the preference at an advanced price.—G. LEE.

#### HEATING—FUEL.—No. 4.

THE first requisite in a heating apparatus is power, the second efficiency, and the third economy. Power and efficiency are in a great measure dependant upon the boiler, but all three are to a large extent affected by the mode in which the heat obtained is applied. We communicate heat to a great volume of water, and only permit it to be radiated in the structure to be heated from a small extent of surface.

Now, a structure heated by hot water is warmed in proportion to the extent and heat of the pipe surface exposed within it. Pipes heating beds, only give heat indirectly to the house, consequently pipes used for bottom heat are not to be taken into account when calculating the amount of piping required to heat any structure to a given temperature. It is usual to follow Tredgold in calculating the extent of piping required. His rule is "Multiply the cubic feet of air to be heated by the number of degrees the house is to be warmed, and the result divided by twice the difference between the temperature of the house and that of the surface of the pipes will be the feet of piping required." In using this formula we must bear in mind that the temperature of the surface of the pipes at their maximum may be  $200^{\circ}$  or even boiling ( $212^{\circ}$ ), but as a rule are rarely over  $180^{\circ}$ , which we will adopt as the maximum temperature of hot-water pipes. Let us apply this to a stove under my care, 30 feet by 24 feet, and containing 5280 cubic feet of air. The maximum from fire heat is  $65^{\circ}$ , the temperature of the air being  $20^{\circ}$ , which is  $45^{\circ}$  of difference. From the 5280 we must deduct 500 cubic feet for a bed which occupies the centre of the house, and we have 4780 cubic feet of air to be heated by artificial means  $45^{\circ}$ . This, according to Tredgold's rule,

$$\frac{4780 \times 45}{180 - 65 \times 2} = \frac{215100}{230} = 935 \text{ feet of pipe surface at } 180^{\circ}, \text{ which is more by 300 feet of piping than required in actual practice. 600 feet of surface at } 180^{\circ} \text{ are sufficient to maintain the maximum of } 65^{\circ}, \text{ the external air being at } 20^{\circ}.$$

Tredgold, however, affords us data for ascertaining what he terms the cubic feet of air. "To the length of the stove in feet, multiplied by half the greatest vertical height in feet, add  $1\frac{1}{2}$  time the whole area of glass, and also eleven times the number of doors [in feet]; the sum will be the number of cubic feet to be heated from the temperature of the external air to that of the stove." In the case of the stove, 30 feet multiplied by 8 (half the vertical height) = 240; this added to  $1\frac{1}{2}$  time the whole area of glass = 1734, and eleven times the doors (four) or 880,

will give a sum of 2854 as the cubic feet. Therefore, as per rule above,

$$\frac{2854 \times 45}{180 - 65 \times 2} = \frac{128430}{230} = 558 \text{ feet of pipe surface, equivalent to six rows of 4-inch piping all round the house excepting the two doorways.}$$

The latter method of calculating the piping required to maintain any temperature desired is very nearly accurate and accords well with practice, but unless Tredgold's method of ascertaining the cubic feet to be heated be adopted the calculations are almost twice too high.

By Hood's method we also obtain an equally erroneous number of feet of surface. Hood's rule is, "Multiply 125 by the difference between the temperature at which the room (or structure) is proposed to be kept, when at its maximum, and the temperature of the external air, and divide this product by the difference between the temperature of the pipes and the proposed temperature of the room; then the quotient thus obtained, when multiplied by the number of cubic feet of air to be warmed per minute, and this product divided by 222, will give the number of feet in length of pipe 4 inches diameter, which will produce the desired effect." This rule applied to the stove would be:— $15^{\circ}$ , the difference between the temperature at which the house is to be kept and that of the external air, multiplied by  $125 = 5625$ , which divided by the difference ( $115^{\circ}$ ) between the temperature of the pipes ( $180^{\circ}$ ) and the proposed temperature ( $65^{\circ}$ ), will give 48. This multiplied by the number of cubic feet of air to be warmed per minute ( $4780$ ) =  $229,440$ , which, divided by 222, will give us the number of feet of 4-inch piping required = 1033, or nearly double what actual practice demands. The rule is applied to raise the temperature from  $20^{\circ}$  to  $65^{\circ}$ , which I am convinced is not the proper minimum to calculate from as that of the external air. It would be much better to reckon the external air at  $32^{\circ}$ , and the temperature of the surface of the pipes  $180^{\circ}$ , which ought never to be exceeded in plant houses, except in very severe periods, and the figures would then stand as under:— $125 \times 33 = 4125 \div 115 = 35 \times 4780 = 167,300 \div 222 = 753$  feet of 4-inch piping, which is fully 133 feet more than in practice is required.

We should, however, bear in mind that Hood calculates the temperature of the pipes to be  $200^{\circ}$ , or  $12^{\circ}$  less than the boiling point of water, which is very much too high a degree for the pipes in horticultural structures to be heated for any considerable time; in fact, life-long practice as a gardener convinces me that the lower the temperature of the heating surface the more congenial is the heat to the growth of plants. Instead of heating pipes to a temperature of  $200^{\circ}$ , or even  $180^{\circ}$ , I am satisfied the pipe surface should seldom exceed in temperature twice that required to be given any structure to be warmed. This would entail a larger heating surface than would be needed were the heat radiated at a higher temperature; as, for instance, for the stove aforementioned we at  $180^{\circ}$  require 753 feet to give a temperature of  $65^{\circ}$ , calculating the external air at  $32^{\circ}$ ; but if the temperature of the pipes were  $200^{\circ}$ , according to Hood we have  $125 \times 33 = 4125 \div 135 = 30 \times 4780 = 143,400 \div 222 = 645$  feet of piping required. Even this in severe weather is an excess of piping, so that by adopting Hood's rule for determining the feet of piping required we need not heat the pipes so highly as were the rule of Tredgold adopted.

Although it is desirable to have a large rather than a small amount of heated surface, the cost of the one is very much greater than that of the other. Some, though aware that a small extent of piping radiating heat at a high temperature is not so good for healthy vegetable growth as a larger surface at a lower temperature, are, nevertheless, from pecuniary considerations, desirous of employing no more piping than is absolutely necessary, the pipes being heated to the maximum of  $200^{\circ}$ . The minimum amount of piping would seem to be secured when we take as the temperature of the external air that of the mean temperature of the coldest half of the year or winter months, which in this country is  $40^{\circ}$ .

I have a greenhouse which is 26 feet square, and by Hood's rule, the external temperature being considered  $40^{\circ}$ , and the house to be kept at a maximum of  $50^{\circ}$  from fire heat, we have  $125 \times 10 = 1250 \div 150 = 8 \times 5108 = 43264 \div 222 = 190$  feet of surface at a temperature of  $200^{\circ}$ , the actual piping employed being 182 feet of 4-inch, or two pipes, a flow and return on a level all round, except doorways. This amount of piping, though sufficient to keep out frost, is not to be advised, as the heat is given out at so high a temperature as to dry the atmosphere too much in the immediate vicinity of the pipes. The temperature of the external air may, for this country, be cal-

culated at 40°, the mean of its winter months (and in all countries it would be safe to take the mean of the coldest months of the year as that of the external air); but for the successful cultivation of plants and fruits it is not good policy to attempt such cheeseparing, and I therefore advise for this country the external air to be reckoned at 32°, and determine the feet of heating surface at 200 by Hood's rule, for the piping found by it, though entailing a somewhat greater first cost, would be infinitely better for the plants (the surface seldom needing to be heated over 160° to give the required temperature within the structure), and the saving effected in fuel afterwards would more than balance any claim for interest on extra first cost or outlay in pipes.—G. ABBEY.

### THE ROSE GRUB.

A FRIEND has written for information, asking a question that must occur to many, so I have thought it best to answer it through the pages of the Journal. It is this—speaking of budding Roses—"How about buds that show a hole through them, after separation from the wood—should they be used?" Most certainly not, even if it is the only bud of the sort you have. Throw it away, it will not grow. The hole is caused by "the worm i' the bud." The larva of a little lepidopterous insect belonging to the Tortricidae, a Spilonota—probably *roborana*, *tripunctana*, or *rosaccolana*—vulgarly the grub of a little moth called the Long Cloak. I do not quite know whether its metamorphosis is thoroughly known, but certain it is the ova or egg is laid in May, June, and July on the tip of the bud, and the larva hatching, bores down into it, eating its way through. Some of the larvæ feed on rapidly, and successfully pass from larva to pupa, and from pupa to imago, or the perfect moth state, the same summer, while others hibernate—perhaps from the eggs of the late-hatched moths, but this I am not certain about. The hand of God is too great in His work for me to say what is in the provisions of Nature! it is enough for me to hear with my ears, and to see with my eyes; but to say the larvæ that hibernate are only from the late-hatched imagos, or a second brood, is too much for my poor philosophy. I know not His manifold ways.

"I know not what I am, but only know  
I have had visions tongue may never speak."

But I am wandering—am losing myself in the love I feel for His works.

"As I feel and wonder, listen,  
Listen in a dream."

For all the time the grub in question may be another species' and even genus, than the above-mentioned, as I find the perfect form of another Rose-feeder, *Anthithesia ochroleucana*, is by no means rare in my garden, and the larva state of which, I believe, has not yet been described.

Well, I was going to say some of these larvæ (grubs) hatch in June and July, bore through the heart of the bud down into the pith of the wood, and there hibernate through the winter, ready to commence operations in the spring, and to eat out the heart of shoot after shoot, much to the annoyance and disgust of the Rose lover and grower.

It often happens, after cutting a bud and separating the shield from the wood, that a small pin-hole is to be seen clean through the bud nicely but thinly lined with a silken web, and on inspecting the shoot from which the bud was cut you will, perhaps, find you have cut through a very small brown larva with a bright black head; if not, cut further and deeper into the wood, so long as you can follow up the hole, and then you will find the little wretch (Rose-grower now) snugly ensconced. I always give them a dig with the point of my budding-knife. Rose-grower still, although lover of nature; but somehow my love for the Rose is too great for my love of nature generally, and I find I cannot keep to the good old "live and let live" in this case.—W. FARREN.

### THE PATENT GLASS-CUTTER.

TAKING advantage of the many valuable hints that appear from time to time in this Journal, I have built a small greenhouse, 14 feet by 9 feet, span-roofed, and being only a labouring man have had to do the whole of the brick-setting, joinery, painting, and glazing myself, and under the peculiar circumstances in which I obtained the glass it was necessary that the whole of it should be cut 8 inches by 6 inches. To purchase a diamond would have been a serious financial consideration,

my means being somewhat crippled by my already large expenditure; but on receiving my copy of the Journal my heart leapt when I read your paragraph on Messrs. Dick Radclyffe's Patent Glass-cutter. I took advantage of what I considered my good fortune and wrote for one, and obtained it immediately. It served my purpose beyond my expectations, but, in consequence of the great amount of work it had to do, it confirmed your misgivings about its durability, and became dull and required resetting; and confiding in your statement, "that you understood it could be reset for 6d.," I returned it to Messrs. Radclyffe with the required number of stamps. It was returned with a note that "it is so cheap that resetting is out of the question."

I should not have troubled you had it not been, that, feeling satisfied there was some misunderstanding somewhere, I thought it advisable to inform you of the circumstance. I do not wish to find fault with the useful little instrument, because for ordinary purposes it is a marvel of cheapness.—T. NORTON, Leeds.

[When we said the cutter can be "made equal to new for 6d." we quoted from Messrs. Radclyffe's communication.—EDS.]

### THE KITCHEN GARDEN.—No. 6.

I now come to the formation of the garden, and wish first to direct attention to the importance of securing a proper starting point, so that the course of the walls will be true to the different aspects required.

Now, whatever shape a garden is intended to take, we should first find out the direction of the four cardinal points, and mark their positions, so that they may be easily referred to if needed in any subsequent operations. Generally there are surrounding objects indicating with sufficient exactness one or

Fig. 1.

more of the points sought, and from which a line may be traced out to serve as a starting point, but in the absence of any such guide the next method, and perhaps the most reliable one, is to first find out the meridian line. This may be done by fixing a long straight pole or stake quite perpendicular in the ground, as near as possible to the spot about to be enclosed. At midday this pole will throw a shadow, whose length will be in fair proportion to the height of the pole. This line will of course point towards the north, and at the extremity of it another mark should be fixed, which will give the direction of the wall that is to run from south to north. Or, presuming that the garden is to be in the form of a square or any other regular-sided figure, and that the operator is standing on the right-hand side, this line would indicate the course of the east wall; and it may be extended to the length required if

the ground is tolerably level, so that a sight can be obtained by placing stakes at regular distances in a line with those first fixed. In doing this there ought to be two persons engaged, one to place the poles while the other takes the sight from the first two poles put down. After fixing upon the length of this wall the next thing is to strike out the line for the wall that is to run from east to west, or the north wall, which ought to proceed at right angles to it. In order to make sure of this, instead of trusting to the eye alone, it will be found by working out a simple problem in practical geometry.

The accompanying figure (*fig. 1*) will give the method. The line *AB* is 2 inches long, and for the purpose in view we will say that it represents 20 feet, or the wall running from south to north as above described. Extend the line 1 inch, or 10 feet beyond *B*, and take that length as a radius, and describe an arc touching at points *c* and *d*. The width from *c* to *d* is equal to one side of the figure. Now take three parts, or 15 feet of this width, and from points *c* and *d* describe the arcs at *e*, then draw a line from *B* through the intersection at *e*, and it will give you the direction the north wall ought to take to be at right angles with *AB*. Proceed in the same manner to find the course of the other walls, and the square will be completed.

The above describes the formation of *fig. 1* in my article No. 5 (page 121); for *figs. 2* and *4*, which are oblong instead

Fig. 2.

of square and the walls proceeding at right angles to each other, the same rule may be adopted, the only difference being that in the former the north and south walls must be extended to the desired length towards the west, and in the latter the east and west walls towards the south.

*Fig. 3* (page 121) shows some difference from the others as its shape indicates, but only in the position of the south wall. Now, as before stated, by adopting this shape it is intended that there should be no part of the garden within the walls on which the sun could not shine at some time on a clear day during the summer months, therefore it is necessary to be particular that this object is secured by giving the wall its proper position. Assuming that the other walls in this garden are placed east, west, and north, and that the west wall is 60 feet long, the east wall ought only to be one-third the length of that, or 20 feet; then if the south wall starts at the extremity of the west wall and joins the east wall at *B*, that will give the direction required. *Fig. 2* will illustrate my meaning, and it will be seen that the length of the wall *AB* is considerably greater than if on the square, which will be considered an advantage by some.—THOMAS RECORD.

### ROYAL HORTICULTURAL SOCIETY.

A RUMOUR having got abroad that a number of the Fellows of the Royal Horticultural Society had formed themselves into a body to institute a suit in Chancery against the present Council, we have received the following communication from good authority intimating what the real proceedings are. It is certainly very desirable for all parties that any doubt as to the responsibility of the late and present Councils should be set at rest.

"Allow me to inform your readers that the measure now contemplated by some Fellows of the Royal Horticultural

Society for the purpose of deciding the legality question is not a suit in Chancery, but a very different and more simple proceeding. The Lord Chancellor has a peculiar and especial jurisdiction in such cases, and it is to him that the appeal will be made. The situation has now become an intolerable one, and the gentlemen alluded to have determined that the question shall be settled one way or the other.—R. T. C."

I AM not going to inflict another long letter upon you, but must beg for a small space to answer objections raised to the guinea subscription plan. At the Wednesday meeting I was placed near four good specimens of their respective branches of the profession, two being well-known nurserymen and two first-class gardeners; one of the former suggested that I was trusting too much to gardener subscribers. As one of the gardeners spoke out well for his class, I left them to settle the matter between them, but afterwards had the objection raised more fully. I will now answer it.

I never contemplated the social position of the Society being lowered, or that the renovated Society should consist in a very large part of gardeners, though I believe that a considerable accession of these mere working bees would greatly strengthen it. A head gardener, to keep his situation in a large place, must be a superior man, and it is only the best of these (such as those who work so actively on our Committees), who would take enough interest in general horticulture to make them afford the guinea annual subscription. In very many cases their influence would make their employers join the Society. Judging from the letters that come to me, the idea of the guinea Fellowship has been most warmly taken up by people in as high social station as that of the present Fellows, and they talk of influencing their friends, presumably of the same class, to join with them.

I see the acting Council has published *in extenso* in one of your contemporaries the Society's accounts for the past year. Let anyone look through these, bearing in mind that much of the cost of Chiswick goes for furnishing South Kensington, and judge for himself whether a Society with the guinea subscription of 5000 Fellows would not have far greater working power than the Society in its present state has with the much larger income, of which the lion's share goes to keep up a square for the Kensingtonians.—GEORGE F. WILSON, *Heatherbank, Weybridge Heath*.

I AM sure it would be very satisfactory indeed to be informed whether there is to be a grand provincial Show of the Royal Horticultural Society this year or not. Yes or no, one way or the other. If the former, why we can all wait for the schedule; and if the latter, there would be an end of the matter. It ought to be settled one way or the other. Even supposing a show to be decided upon, it will occupy a very considerable time before the schedule can be in the hands of exhibitors, and it would be both a mistake and a hardship to spring a schedule upon them at the eleventh hour, when in many cases proper preparation would be impossible.—T. M. SEATTLEWORTH, F.R.H.S.

### NEW BOOK.

*The Potato Disease and its Prevention.* By C. DIMMICK, Nurseryman, Ryde, Isle of Wight. London: Houlston and Sons.

WE have received several pamphlets on the same subject, but not one characterised by the good sense of Mr. Dimmick's. We will give a few extracts, and recommend the entire pamphlet to our readers.

"After long and careful investigation I came to the following conclusions:—

"1st. That the Potato being a native of a dry, warm, sunny country, it requires extraordinary care to preserve it in a state of health in more northerly regions.

"2nd. That it is a disease and not a blight.

"3rd. That the constant rubbing-off of the shoots of the seed tubers, which had been practised year after year, had so diminished the vital energies of the Potato, that its constitution has become weakened and debilitated thereby, and rendered increasingly susceptible. And that the constant ill-treatment and high cultivation it has been subjected to, combined with the sudden changes of our variable climate, have brought it into a state of disease.

"It is reasonable to conclude that the laws of Nature may be interfered with in a vegetable as well as in an animal, and in my experience I have found how remarkably Nature's laws have

been violated with regard to the Potato. If an animal is taken from a warm climate to a cold one, extra care is required to preserve it in health. This is a fact which all keepers of zoological collections can corroborate, and the greatest care is taken in their institutions to keep each animal in the fullest vigour, so that they may not suffer from the change of climate and other foreign circumstances by which they are surrounded, and of all animals the natives of tropical countries would be the most likely to fall into a state of disease if these precautions were neglected."

"Depend upon it, one great cause of the disease is that we have not sufficiently studied the native country of the Potato and adapted our treatment to it accordingly."

"I remark further, that it is a disease and not a blight, and that feebleness of constitution in the Potato is the great predisposing cause of the disease."

"The same causes always producing the same effects. In all cases when the disease sets in just as the plant is making an effort to perfect its tubers it is more violent than when the tubers are in a more advanced state; this is the reason why early Potatoes ripening in July are not so liable to an attack of the disease as are later crops. In the first place, early kinds have always been more carefully treated; and secondly, they are scarcely ever subject to the same exciting causes, arising from sudden changes during their growing season."

"I come now to the principal cause of the disease—viz., the constant rubbing-off of the shoots of the seed tubers, which operation being repeated year after year has so diminished its vital energies, that the constitution of the Potato has become weakened and debilitated, and thereby rendered increasingly susceptible of disease. And the constant ill-treatment and high cultivation it has been subject to, combined with the sudden changes of our variable climate, have brought it into a state of disease."

"As a grower, I well remember how this process has been conducted, generally once before Christmas and twice or thrice afterwards, and on each occasion shoots in large quantities have been taken away. I once said to one of my men as he was taking away a large basket full of these shoots to the muck heap, 'Don't you think it will greatly exhaust the Potato to be continually taking away these shoots?' He replied, 'No doubt of that; and, besides, you won't have so many Potatoes in measure by nearly one-third at planting time as when they were first stored away.' I found this to be perfectly correct, for when planting time came the tubers were reduced to about half their original weight; they had lost their solidity, and handled like pieces of sponge, consequently their life, and health, and vigour must have been greatly reduced."

"The next consideration is the storing of the tubers for seed, a matter of the most vital importance, because the first shoots must positively be preserved. I lay more stress upon this than upon anything else, because it is of more importance than all other things together, for if you put your seed Potatoes away in masses and encourage them to grow out, and repeatedly take away the shoots, you take away that power which would enable them to resist the disease in the future. The seed tubers, therefore, should be stored as soon as they are dug up. Dry warm days should be chosen for this work, for if they are taken up wet they can never be dried so well afterwards, and if you can let them remain in the sun for a few days after they are taken up so much better; but never mind about greening them before they are stored, they will green fast enough afterwards if properly stored. In all cases handle them very carefully, even as you would your choice Apples and Pears; always set the most careful man you have to select your seed Potatoes if you cannot possibly do it yourself."

"The time of planting will vary a little, and will depend also upon the weather and the state of the soil. March is the proper time, and it is a very good rule to begin at the beginning and finish at the end of the month; but if the weather is open, and the soil in a fit state, planting may be begun in February, especially where there are large quantities to be planted; but should it be a backward, wet season, and the land in an unfit condition, it will be much better to wait, even though it may become necessary to put on extra strength to get them in quickly, for there is generally dry weather in March. In all cases planting should be finished by the middle of April. There will be no great difference between their times of coming out of the ground, for even those planted in April will be up quite as soon as it will be safe, for we often get hard frosts the first or second week in May."

**CROQUET GROUND.**—In your Journal of February 5th you say, "60 yards by 20 yards is a good proportion." Sixty yards would be too long, and 20 yards too narrow. A full-sized croquet ground is 40 yards by 30 yards. All the grounds at Wimbledon are set out of this size.—G. A.

[The croquet ground 60 yards by 20 yards is used for two

sets. We are aware that the full size for one set is as stated by our correspondent.—EDS.]

### NOTES BY THE WAY.—No. 3.

THE town of Mentone, or Menton as it is now called, since its annexation for the second time to France, is a small place with a resident population of little over six thousand, but in the season, which extends from the middle of November till the end of April, it is increased by between two and three thousand. It is situated in one of those lovely crescent-shaped bays in the Gulf of Genoa, of which Capo S. Martino and Bordighera respectively form the horns, and Mentone is in the centre of the crescent. No breath of rude winter wind ever comes near it, and there it lies in the month of January basking in a brilliant sun, and the blue Mediterranean in front reflecting the rays like a Titanic mirror. But for all that Mentone has its troubles, and those who come here expecting to be rid of theirs are too frequently disappointed. It is said that "every Rose has its thorn," and health-seekers will find that even here they cannot indulge in acts of indiscretion any more than they can elsewhere. Though the climate is so fine it is very treacherous. The mornings and evenings are cool while the days are sometimes unaffably hot; and when the wind blows from the sea, even on these hot days when invalids are tempted to sit and lounge about, they almost invariably catch colds which are sometimes of a very serious character.

The vegetation with which we are everywhere surrounded has all the character of a subtropical region. The Date Palm (*Phoenix dactylifera*), of which there are some magnificent specimens in the gardens, here seems to luxuriate; but though it blooms and fruits freely, there is not sufficient heat to mature the fruit. Agaves abound, both the green and the golden-striped variety, these being planted in rows along the promenade and in all gardens. At Villa Medecin, the residence of the Mayor, I measured the leaves of a striped one, which were 6 feet 6 inches long, and this was not the case with one plant only, but with many. I thought how some of our exhibitors at home would long to have a pair of such for a collection of twelve greenhouse plants. Here there are no greenhouses, and the Agave is a hardy plant, growing on hill-sides by the roads and railways. Among the other plants grown in the gardens and shrubberies are *Sparmannia africana*, Australian *Acacias*, and *Mimosas* of several species, and towering above everything may be seen in every garden *Eucalyptus globulus*, in some cases 50 feet high. *Salvia fulgens*, *Cineraria maritima*, *Veronica Andersoni*, and *Fabiana imbricata* assume the form of bushy shrubs, while there are Roses now covered with bloom, conspicuous among them *Maréchal Niel* and *Gloire de Dijon*. *Datura arborea* and the red variety of *Castor Oil plant* (*Ricinus communis sanguineus*) are quite trees, now blooming abundantly. *Eriobotrya japonica*, *Justicia arborea*, *Abutilon striatum*, *Habrothamnus elegans* are also large trees or shrubs now in bloom. The Prickly Pear (*Opuntia*) is seen in great masses everywhere; and one of the most elegant and most abundantly-grown trees of any is *Schinus Molle*, a very elegant and graceful tree, with its pendant pinnate leaves and its clusters of coral red berries. When bruised the leaves have a strong balsamic odour, and emit a milky juice which is quite resinous. This tree is very properly planted everywhere. At Nice there are rows of them on the Quai Massena, in the public gardens, and, indeed, wherever trees are planted. *Pittosporum Tobira* is also another favourite tree, attaining the size and producing much the same effect that *Portugal Laurel* do in England. The *Oleander* is very abundant, but not yet in bloom. There is a pretty plant which produces a fine effect here at present, and which at first sight looks like *Tropæolum canariense*, as it rambles over screens, bowers, and buildings; it is *Senecio mikania-formis*. I never see it in England anywhere. I should think it would make a good conservatory climber, and it blooms all the winter. It is much grown in pots and suspended from *corbeilles* in Belgium, from which it depends in "Creeping Jenny" fashion.

Gardening in the south of Europe is not practised—at least what we in England call gardening. Everything here grows of itself, and neither gets nor needs tending. Trees are pruned when they need pruning, and weeds are kept down when they grow; but the climate is so hot in summer that neither weeds nor garden flowers can grow. To garden here means incessant watering, and water is scarce except during the rainy season and when occasional showers come. Kitchen-garden crops

are good, and the markets are bountifully supplied. Already, in January, early Peas are coming in. The gardens in the suburbs have all rows of Peas now 4 feet high in full bloom and some pods showing. Broccoli is very abundant.

The great cultures here are Oranges, Lemons, Olives, and Grapes. Of the Oranges I cannot speak in very high terms, for although they look by appearance to be ripe, they really will not be so till April or May. In some instances I have observed the crop being gathered now, doubtless for exportation, as the fruit will now bear carriage better than it will when fully ripe. I doubt much if they ever attain the high perfection we find in the St. Michael's and Maltese Oranges imported into England. The greatest height above the sea where I have found the Orange growing is 610 feet on the terraced gardens on the mountains. The Orange is not so extensively cultivated as the Lemon, although the tree withstands a greater amount of cold, and is hardier, the reason being that the Lemons cultivated about Mentone are said to be the finest to be had in commerce. The annual produce is said to be thirty millions of fruit. Every day at this season the women may be seen bringing in great baskets full of fine large fruit from the gardens to the merchants' stores, all of which are carried on the head—such weights as almost terrify one to think how these people can bear them for such distances as they travel. I am told that some of them come from two or three miles with a load which cannot be less than a hundredweight. They remind me of the Strawberry women who used some years ago to carry the finest Strawberries from distances about Isleworth, Twickenham, Mortlake, and Deptford to Covent Garden Market. This practice seems abandoned now, and the fruit is carried in carts made expressly for the purpose. Some contrivance might be devised here to liberate the women from such unwomanly drudgery, and one instinctively asks why it cannot be done by mules, which perform every other carrying work that is needful between the town and the mountains. I am told the Lemon blooms all the year, and that it produces four successional crops. There are places here where essences are extracted in large quantities from the Orange and Lemon peels, and this forms one of the important commercial products of the place. One of the largest of these is conducted by the Mayor, M. Medecin, and the large merchant of the town in the finest Lemons has his magazine in front of the window where I now write.

The Olive tree grows here in great luxuriance, and attains an enormous size and great age. I measured one near the Borigo valley, a very old tree, which 2 feet from the ground was 18 feet in circumference. The trunk was very deeply furrowed, and the tree itself, which is now becoming rather bare and "stag-headed," resembles in its old age one of our old trees of *Salix alba*. The Olive may be said to be the tree of the country. Wherever you see a shade of sombre green be assured it is an Olive. In ascending the mountains I found it cultivated to the height of between 1300 and 1400 feet, and then it ceased to give place to Chestnuts, Walnuts, and Figs. The Olive seems to be a tree of great vitality, for however old it may be, and however denuded its branches are, there is always a crop of strong suckers emitted round the trunk and from the roots. Some of the trees I have seen must be many centuries old, and from them we can gather how long these terraced gardens in this country, which reach even to the top of the highest hills, have been made; for on the way to S. Agnese, 1300 feet above the sea, I saw some patriarchal trees, now going to decay, occupying their original place on the top of the retaining wall of the terrace.—R., *Mentone*.

## THE BEAUTIFUL AND USEFUL INSECTS OF OUR GARDENS.—No. 16.

In a locality which shall be nameless here an individual resides who is not by any means a bad amateur gardener, and who cultivates the study of zoology as well as horticulture. The former he has managed to turn to a practical purpose in his garden, and sundry four-legged creatures roam there upon which many persons look with suspicion, and perhaps disgust. You walk up to one of the sheltered walls to examine his fruit trees, and on the ground, snugly ensconced in an angle of the wall, and reposing there after he has been banqueting upon a host of snails, a huge toad leers up at you. As you sit in his summer-house you hear a strange rustling under the seat, and presently from a corner out walks a hedgehog, introduced to the domain on account of its appetite for insects, especially beetles. Birds of various species, some of

which are, at least occasionally, guilty of touching in a garden what they should leave alone, though they usually prey upon insects, are freely tolerated or even encouraged. Most astonishing of all, and provocative of screams on the part of lady visitors, in one plot of ground which is entirely shut-in our friend allows several blindworms to range about and feast on slugs and snails, or insects should they so incline. I have no doubt that Mr. Wood is right in asserting that this harmless and sadly abused lizard is really as good a friend to a garden or field as is the thrush, only from the way in which it works nobody observes how much service it renders us. But I was going to add that our worthy friend with all his acuteness is not awake to the value of insect helps in enabling us to keep some troublesome species in check. For instance, if I were to propose to him the introduction into his garden of a colony of burying beetles he would probably shake his head, though he knows something about the habits of these insects, and argue that though they might do a little good by interring certain objects which are better laid under the mould, they would probably also make free with the roots and tubers of plants; also he might, perhaps, urge that the burying beetles, unlike intelligent bipeds, will exercise no judgment in their work. If they found a dead bird it is all but certain they would dig its grave on the spot, whereas the gardener might think that it would prove a desirable fertiliser in a different place. A strong prejudice which we most of us imbibed at early childhood, and which leads us to be suspicious of the insect races generally, helps to limit the encouragement given to useful species.

Many, more particularly those which may be called "darkling insects," because their labours are carried on at night, or beneath the surface of the earth or some other substance, do us benefit and we know nothing about it; they come into the horticulturist's territory unasked, and it must be admitted they do not destroy noxious species out of pure kindness, but for their own benefit. The burying beetles and some of kindred habit, may be said to be of service to us in two ways—firstly, by burying or devouring dead animals which might render the air not only noxious to human health, but also hurtful to plants; and secondly, they help to fertilise the soil by placing beneath it matters very useful when decomposed, towards which decomposition the beetles lend their aid. The beetles now under consideration belong to the section called Rhyphophaga, or, in plain English, Filth-eaters; and it must be owned that the habits of both the land and the water species are a little offensive to our refined notions. The water beetles, indeed, prey both on land and in their usual element, which they quit at night occasionally. These are furnished with hind legs, which serve as paddles; they are the Philhydride, or Water-lovers. Next to them is the group of the burying beetles which have legs fitted for running, short and square wing-cases, and antennæ clubbed, the club or knob being large and round. Like the vultures, these carrion-seekers of the insect race are endowed with strong wings, which enable them to travel, when needful, long distances after the objects which, unlike most birds of prey, they can rarely discover by sight, but by smell or some sense unknown to us.

The Necrophori are more common in rural districts where habitations are sparingly distributed than they are in the vicinity of large towns. Possibly they consider that where the latter exist men ought to take upon themselves the duty of scavengers, and not require much aid from the insect world. Walls will not exclude them from a garden should they be desirous of entering it; and where there is one of these to be seen we may be almost certain that there are others not far off, for it is their wonted plan to work in parties. Strong and persevering as these insects are while at their toil, which is not so much for the benefit of themselves, but of their offspring, they could not succeed in some of their endeavours if they did not work together, and also on a mutual understanding. Not only may they be called gravediggers, they are also undertakers, for they take under whatever object it be upon which their attention is concentrated. Nor does it cease to be regarded with interest even after it has been hidden from view; for after a dead animal has been decently buried these beetles enter the earth themselves, or at all events the females do. It is beyond the power of the Necrophori to remove a quadruped, bird, or fish of any size from the place where they find it, so their plan is to sink a hole beneath the body and remove the earth which presses around it as it sinks into the cavity, until at last it is brought several inches below the surface, when by a continuance of the labour the earth is filled-in. Figuiier says that the depth at which a carcase is laid is from

7 to 10 inches in the instance of the burying beetles that are most common: this, however, is a little over-estimated. The head and the legs are, of course, the only implements the beetle can employ; but by changing its position, and alternately employing different pairs of legs, one of them has been seen to work on with scarcely a moment's pause for some hours. By several pushing or dragging together, these insects manage to shift a dead animal a little, should it not be precisely as they wish; but I can scarcely credit the statement of Gleditsch, that when he had set several of the *Necrophori* to bury a dead linnet, one of them, by an extraordinary effort, lifted the bird and placed it in the grave. Some credit is certainly due to this entomologist for having through nearly two months watched a number of these at their labours, giving them a variety of subjects to work upon. He found (and the experiment has been repeated by others), that if a dead animal was fastened to the end of a stick, and even tied thereto, the beetles will undermine the stick and gnaw asunder the string by which the carcase is secured. It would be curious to ascertain—which has not yet been done—whether the burying beetles would attempt to do anything with a dead animal lying amongst long grass, where digging could hardly be attempted.

The largest burying beetle found in Britain (*Necrophorus germanicus*, *fig. 1*) is nearly black; the other species are banded with orange and black, and of these *N. vespillo* (*fig. 2*) seems most generally distributed. The odour they give forth is peculiar and disagreeable; not, however, exactly resembling the products of decomposition, but rather musky, no doubt protecting the species from the attacks of some enemy. The larvæ also, long-bodied creatures, with scaly segments and very short legs, grow slowly, and, having attained their full size, form earth cocoons for themselves, coming forth as beetles in early summer. The poet has managed to throw a little romance about the proceedings of the burying beetles, and writes thus of them:—

"From sire to son through circling years  
Labour these watchful creatures, noting well  
If falls a small bird from the bending spray,  
Or mole tossed out by ruthless hands, his home  
Laid waste, himself a corpse, where late he wrought  
With patient toil his humble shed to rear;  
Or brown mouse sleeping his last sleep—  
Each and all are laid the earth beneath  
With decent care."

In the tribe of *Silphidæ* are smaller species as serviceable to man as the *Necrophori*; some, indeed, more so—as, for ex-

ample, the Four-spotted Silpha (*S. quadripunctata*), represented in the accompanying woodcut—*fig. 3*), a reddish brown beetle,

Fig. 1.—*Necrophorus germanicus*.

Fig. 3.—*Silpha quadripunctata*.

with two double spots on the elytra or wing-cases. At first glance it may seem to resemble a lady-bird, though the body is more elongated. In the perfect state these beetles have been seen feeding upon caterpillars on the Oak and other trees, while the

larvæ devour offensive and decaying substances, which are not interred by the parent beetles usually, though they had long ago the name of "Sextons" given to them, because they are sometimes to be seen digging into the earth, or into manure, &c., resting thereupon. It must be acknowledged that one of the *Silphidæ*—namely, *S. obscura*, has been found in the act of doing damage to Beetroot, which fact is, therefore, a partial set-off against the services of certain of its relatives. *S. lavigata* preys frequently upon snails; and despite the spume which these molluscs throw out when they are approached by an insect enemy, the beetle manages to overcome and devour them. The larvæ of the *Silphidæ* are likely enough to be turned up by the spade or fork, and as likely to be considered hurtful creatures, for they are black unpleasant-looking grubs, yet, with the one exception mentioned, rather useful than otherwise. They are much more rapid in their movements than the larvæ of the *Necrophori*.—J. R. S. C.

#### ASSOCIATION OF SCULPTURE WITH PLANTS.

WHATEVER observed justly of the dressed grounds, that "nothing should seem neglected near the house; it is a scene of the most cultivated nature; it ought to be enriched; it ought to be adorned; and design may be avowed in the plan, and expense in the execution. Even regularity is not ex-

\* From Figuier's "Insect World." Cassell's edition.

cluded; so capital a structure may extend its influence beyond its walls; but this power should be exercised only over its immediate appendages. The platform upon which the house stands is generally continued to a certain breadth on every side, and, whether it be pavement or gravel, may undoubtedly coincide with the shape of the building. The road which leads up to the door may go off from it in an equal angle, so that the two sides shall exactly correspond; and certain ornaments, though detached, are yet rather within the province of architecture than of gardening. Works of sculpture are not,

like buildings, objects familiar in scenes of cultivated nature; but vases, statues, and termini, are usual appendages to a considerable edifice; as such they may attend the mansion and trespass a little upon the garden, provided they are not carried so far into it as to lose their connection with the structure. Some pieces of sculpture also, such as vases and termini, may perhaps now and then be used to extend the appearance of a garden beyond its limits, and to raise the mead in which they are placed above the ordinary improvements of cultivated Nature. At other times they may be applied as ornaments to

Group of White Lilies.

the most polished lawns. The traditional ideas we have conceived of Arcadian scenes correspond with such decorations; and sometimes a solitary urn, inscribed to the memory of a person now no more, but who once frequented the shades where it stands, is an object equally elegant and interesting."

One test of a gardener's good taste is the planting he selects for near a terrace and vased wall. We never saw such structures look anything but heavy if round-headed shrubs were associated with them. Irish Yews and other pyramidal-formed plants are especially congruous with such architectures. Of flowers, the white Lily grouped near them, as shown in the accompanying woodcut, for which we are indebted to Cassell's edition of Figuier's "Vegetable World," is especially effective.

way of preserving cut flowers in a state of freshness. It is to dissolve sal-ammoniac, or chlorhydrate of ammonia (obtainable of any druggist) with the water in which the stems are put, in the proportion of five grains to a pint and a half of water. In this way, it is said, they will often keep fresh for a fortnight.—(*Irish Farmers' Gazette*.)

#### NOTES AND GLEANINGS.

We observe that M. Alégaître, of Lyons, will send out in May three new DOUBLE ZONAL GERANIUMS, raised by M. Jean Sisley. They appear to be very remarkable. *George Sand* having double flowers larger than any single one known. It is white when grown under glass, and rose-tinted in the open. *François Pertusati* has large double flowers, aurora edged with white. *Carl Vogt* has medium-sized flowers of a salmon orange of a new shade.

PROLONGING LIFE IN CUT FLOWERS.—M. Fremont, a chemist, in a letter to the French Society of Horticulture, mentions a

§— At last, stirred into action probably by the prospect of the early completion of the new City Fruit and Vegetable Market, the Duke of Bedford has determined to cover-in COVENT GARDEN MARKET. An extraordinary general meeting of the Market Gardeners, Nurserymen, and Farmers' Association was held at the Bedford Head Hotel, Covent Garden, on the 7th inst., to take into consideration the model of the proposed covering. Several of the members were of opinion that the proposed erection was not high enough, and that the 4 feet left open on either side was very objectionable. The openings at the side and the low roof were stated to be for the convenience of those persons who occupy the upper rooms over the shops in the centre row. One of the members suggested that the roof should be carried up 4 feet above the parapet of the buildings on either side, which would afford plenty of light and ventilation to the upper rooms. It was ultimately resolved that a deputation should wait upon the agent to the Duke to thank him for the proposal of covering the market, and to suggest a few alterations and improvements in the model submitted.—(*Building News*.)

— MR. ALFRED DE ROTHSCHILD, the Chairman of the ENSUING GARDENERS' ROYAL BENEVOLENT INSTITUTION ANNIVERSARY DINNER, has named Thursday, the 2nd of July, for that purpose. It is the day after the great Rose Show at Kensington, and several of the leading exhibitors have promised to send their plants from the Exhibition to the London Tavern to assist in decorating the rooms.

— MESSRS. SUTTON, of the Reading Royal Seed Establishment, are presenting a coloured geological map with their "Farmers' Year Book." They think it has long been a desideratum, as it points out to the farmer and landowner the geological strata of the district in which the farm is situated; and tables of the Grasses suitable to soils on the strata are given.

## NOTES ON VILLA AND SUBURBAN GARDENING.

THE amateur who possesses a greenhouse should, towards the beginning of next month, shift Geraniums that are well rooted, using a rather heavy and rich soil, potting, forcing, and keeping the plants well tied out and near the glass. See that Camellias are never allowed to get dry at the root, otherwise you may lose your buds, and do not expose the plants to cutting currents of air. Calceolarias that are well rooted in small pots should now have more pot-room. A soil of half loam and well-decayed dung or leaf mould, with a little sand, suits them well. Pelargoniums which are intended to bloom in the greenhouse must now be removed into their flowering pots, and the branches must be removed or tied-out if large symmetrical plants are desired. Those stopped in November will flower in May; a second lot should now be stopped to flower in June and July, and a third about the middle of April to bloom in August and September. For growing Pelargoniums I have never found anything equal to the parings of grass edgings, or thin turf one year old, and leaf mould and peat earth in proportions of four parts of the former to two parts of each of the latter roughly mixed together, but not sifted; in fact I never silt soil under any circumstances, unless for the purpose of taking the fine particles out, and using the turfy portions only. This compost, with the admixture of a little sand if the plant is delicate, or loam if of luxuriant growth, will answer for all kinds of greenhouse plants, with the exception of Heaths and other delicate-rooted hardwooded plants.

The best plan is to allow the soil in the pot to have the appearance of dryness, but never sufficient to make the plants flag, before a supply is given, which should then be pretty copious; but always empty water out of the pan or feeder in which the pot stands as soon as the soil is properly drained. The water used for the purpose ought always to be of about the same temperature as the room in which the plants grow. Never use it fresh from the pump; either let it stand in a warm room all night, or take off the chill by adding a little warm water to it, or the growth of the plants will be much checked.

The principles of correct planting in the open ground are the same as those which regulate pot culture, allowance being made for the altered circumstances of the plants; indeed, good planting is even more necessary for plants in pots, since they are so artificially situated, and have so little chance of being liberated from the bad management of man by any intervention of Nature. A tree may possibly get on in spite of the want of skill in the planter, because, the soil being favourable, the roots may escape from their pent-up position, and abundant rains may redispense the clods so unceremoniously thrown upon them; but let a plant be once badly potted, and its chance of flourishing is gone. The pot presents an impenetrable barrier to the roots, and the water applied only makes the soil more compact and less

capable of fulfilling its office. There is also this difference between planting in the open air and in pots:—In the one case the work only requires to be done once, while in the other the operation must often be renewed; yet how constantly is this particular forgotten by amateurs who are really fond of flowers, whose collections are sickly because the pots are full of labyrinths of roots, which in hopeless continuity perform pilgrimages around the walls of their prison, seeking a loophole for escape. Turn the mass out of the pot, and how curious is the spectacle. The soil, by some strange process, is gone, and in its place there is a coil of vegetable fibre, which in some cases has traversed six times round the pot in search of fresh nutriment.

The time has now arrived for the florist to bestir himself. Auriculas and Polyanthus must receive their spring dressing by removing the surface soil of each pot down to the roots, and replacing it with the usual compost. Avoid using rich manure for this or any other flower, for it may be asserted as a natural law, that as all plants like fresh soil and leaf mould, a compost of these two ingredients with a little sand will grow plants as healthy, though possibly not so luxuriantly, as a complicated admixture of more stimulating materials. After the plants are replaced in the frame they must have all the air possible by day and night in mild weather, but must be protected from frost. A gentle shower of rain will not injure them on a mild morning, but take care that the water does not stagnate in the centre of the plant, or the bloom will be injured.

Ranunculuses and Anemones should be planted now. Carnations and Picotee layers that have been stored in frames in small pots may now be removed into their blooming ones, taking care that the soil used does not contain wireworms, which are their most deadly enemies. Where there is convenience the plants may be returned to the frame after being potted, but where there is not they must be so placed together in a sheltered place that they can be protected from rains. Sow Carnation seed in pots or seed-pans, and protect it from rain and vermin.

In the flower garden finish the pruning of Roses; in doing so thin-out the weak shoots, and shorten the strong and well-ripened ones to four or six buds according to their strength. Strong-growing kinds such as Brennus, Fulgens, Triomphe d'Angers, and others of similar habit, with most of the Noisette Roses, when budded on tall stems make beautiful objects if instead of being shortened the shoots are turned down and tied to the lower parts of the stem. In the borders sow Sweet Peas and Larkspurs, and prepare for general sowings of annuals next month; but do not rake the borders at present, or they will be rendered almost impenetrable for the whole of the season. Hoe or fork them over 2 or 3 inches deep as often as you please, but do not rake them until the dry winds of March have abstracted a little of the superfluous moisture from the soil. For the sake of a few days' neatness in the early part of the spring, we frequently do more injury to the soil and summer flowers than can be remedied during the remainder of the season.

When the weather will permit, edgings of various kinds may be planted, such as Box, Thrift, Daisies, London Pride, or Gentianella; but while it continues cold care must be taken of anything liable to be injured by frost.

VEGETABLES.—As soon as the weather is favourable a small sowing of Peas and Beans may be made, and as the busy season is at hand everything that can now be done should be forwarded before that time. Ground intended for Onions and Carrots may be pointed over and well broken-up. Alterations and improvements (if any), around the villa should be proceeded with.

FRUIT.—If any fruit trees remain to be pruned they should be finished now; the Grape Vine especially, if not cut in autumn, must not be delayed.—W. KEANE.

## DOINGS OF THE LAST AND PRESENT WEEKS.

### KITCHEN AND FRUIT GARDEN.

*Protecting Blossom from Spring Frosts.*—The forward state of the blossoms of Apricot trees demands that steps should be taken to protect them from frosts. Peach trees on south walls are also in a forward state, indeed more so than those grown in orchard houses. In many large gardens glass cases have been erected against the walls, and under good management they are certainly most efficient protectors. Some have gone so far as to cover their walls with glass in this way, and have fixed hot-water pipes as well. The ordinary coverings are formed of canvas, which is rolled-up under a wood or stone coping in the daytime. Moveable wooden copings are the best; these may be made to project about 11 inches over the trees, being required only when the trees are in flower. They may be removed to a place under cover at other times, and will thus last much longer than if they were constantly exposed to the weather. We have used various materials for protecting the blossoms of fruit trees from frost. Frigi-domo and a material made by Collinge & Son, of Peel Street, Manchester, are the best we are at present acquainted with. The way to manage with the shading is to have poles laid against the wall and let into the ground about a foot. The poles need not come out more

than 3 feet from the base of the wall if it is high; if the walls are low 2 feet will be enough. Strong webbing should be sewn on to the top and bottom of the shading; it may then be nailed to the wall just under the coping, and at the top of each pole a bit of tape or string should be fastened to hold the covering when it is rolled up. A man with a light ladder can go round the walls and undo the strings in a few minutes; another follows with a hammer and nails, and fastens the covering moderately tight to the base of the poles. We also tried one season to cover pyramid Pears in the open garden by raising a framework round them and throwing a covering over; this entailed considerable trouble, and the result was not very satisfactory, for the trees which were covered did not fare better than those exposed. In whichever way the protecting material is used, it ought on no account to touch the blossoms.

We have been finishing trenching and digging, and will immediately proceed to clear the walks from weeds, and give them a fresh dressing of gravel. All such work ought to be finished as soon as possible.

#### FRUIT AND FORCING HOUSES.

**Pine Houses.**—Many Pines had been cut in the fruiting house, and this necessitated the removal of plants from the succession house to fill the space; at the same time the old material, which was composed of spent tan, was turned over and mixed with cocoa-nut fibre refuse. The beds in the succession house were also turned over, and the plants repotted. In doing this a good portion of the old and exhausted mould is removed, as well as the older leaves near the base of the plants. The compost must be rammed in firmly, the plants also being put in rather deeper than they were before. The bottom heat for newly-potted plants should be 90°, and a few degrees above this will be beneficial rather than otherwise, the object being to cause the emission of fresh roots. As the days lengthen more atmospheric moisture will be necessary. The evaporating troughs over the pipes, which have been kept dry up to this time, may now be kept full of water. Seventy degrees is the best night temperature, and this may fall a few degrees in very cold weather.

The first dish of *Strawberries* was picked on the 20th—Black Prince. All things considered, this is the best variety for very early forcing; if the runners are layered in good time and well managed, however early the plants may be started, there is always a certainty of a crop. Keens' Seedling is the next in succession; this is much superior to it both as regards appearance and flavour. President is one of the very best for a main crop, and British Queen the latest. Forced Strawberry plants are persistently attacked by red spider, and good fruit cannot be obtained if this is not kept under. The plants may now be syringed twice a-day up to the time the fruit begins to colour, when syringing must be discontinued. The water must be applied with force to the under sides of the leaves.

**Dwarf Kidney Beans** that have been potted from the seed-boxes are apt to flag during bright sunshine; instead of shading, it is better to dew the plants over with a syringe.

Planted-out the first house of *Melons*; the compost had been in the house about ten days previously. A portion of fine loam was laid on the surface of the bed to raise a small mound where each plant was put in; this to a large extent prevents the plants from dying-off at the surface of the ground, as Melon plants very often do just before the fruit ripens. When the plants were put out the surface of the bed was dressed with rotten manure; this keeps it moist, and also retains water which, evaporating gently, is also beneficial to the plants. Pinched the points out of the growing shoots of Cucumbers, and trained the shoots to the trellis, removing also all decaying leaves from the plants. Smoke for thrips, and syringe in the morning for red spider.

*Melons and Cucumbers* may now be planted-out in hotbeds. To keep down superfluous heat and steam it is a good plan to cover the surface of the beds with turves, the grass side being placed under; on this the hills should be raised. When it is ascertained that the temperature is all right, the plants can be turned out, one or two being put on each hill. The glass must be washed before this, as it is highly desirable to have as much light as can possibly be obtained.

**Mushroom House.**—Fresh beds may be made at any time, the object being either to have a continuous supply or to have them at the time they are required for consumption. It is not always possible to ascertain how a bed will bear. The spawn is not at all times equally good, and at another time the manure of which the bed is composed is at fault—it is, perhaps, overheated or too damp; in either case much of the spawn is injured. The main element of success in Mushroom culture is to have the manure well worked previous to use. It should be laid out on the floor of a dry shed, after having been placed in a heap to ferment; when moderately dry the bed may be made up—it should be beaten down firmly with a rammer or the back of a spade. About the third or fourth day it can be ascertained how the bed will heat, and if the temperature is suitable at that time the spawn may be put in. Break the bricks into pieces as large as pigeons' eggs, insert them to the depth of 1½ inch, and afterwards cover the bed with loam. Should the heat decline before

the Mushrooms appear, cover with oat straw or hay; 55° is a good temperature.

**Orchard House.**—The blossoms are now in a forward state, and on frosty nights the pipes are warmed sufficiently to keep out the frost. Brown scale has been troublesome to us, but it has always been kept under by going over the trees with a sponge dipped in water wherein some soft soap has been dissolved. Aphides increase as the blossoms expand; there is also green fly on the Strawberry plants; so that the house will be well fumigated with tobacco. Ventilate freely in fine weather.

#### STOVE AND GREENHOUSE.

If stove plants are not free from scale and bug they ought to be washed by hand. If this work is neglected until later in the season the insects increase so fast, and there is so little time to attend to them, that the result by midsummer is that the plants are overrun; besides, it is not possible to cleanse such subjects as *Stephanotis* and *Ixoras* from bug if this pest get into the flower heads.

Both hard and softwooded plants may be potted now. The greenhouse is gay with spring-flowering plants, forced Roses, &c. These last are invariably attacked by green fly, and should be fumigated before the flower buds are much advanced, as the flowers smell of tobacco if the buds are partially opened when the house is smoked. Keep the plants as near the glass as possible, and water with manure water, which will bring up the colour in the flowers.

*Hyacinths* should also be taken out of the forcing house as the first flowers open; sticks must be placed to them in good time, and the bells may be regulated with a pointed stick. The bells on some of the varieties are thinly placed, and have also a tendency to hang down, which is objectionable. Such sorts may be improved by lifting the bells up with a stick or pencil, so that they may stand out in a horizontal position.

*Stage and Fancy Pelargoniums* should be trained now if they are intended to make specimen plants. As they are grown by the London exhibitors the shoots are tied down to a wire fastened round the pot. A wire is fastened under the rim first, then two or three sticks are laid over the pots and tied down to the wire so as to project from 3 to 9 inches according to the size of the plant; a stout ring of wire is then tied down to the ends of the sticks, and in this way a plant may be trained-out to a large size. If the object is to secure large trusses the shoots should be few in number and ought not to be bent in any way.

*Chrysanthemums* that were struck from cuttings in December have been potted into 5-inch pots. It is well not to allow such plants to receive any check to their growth. The point is taken out of the plant when it is about 5 inches high; this causes the production of from five to seven shoots near the top, and will allow a clear stem about 2 inches above the surface of the mould. Plants intended to produce flowers for exhibition are not pinched at all; as the leading shoot grows it is tied to a stick to preserve it from injury.

#### FLOWER GARDEN.

Roll the lawn and also the walks; no litter should be allowed to accumulate on beds or borders. Hardy herbaceous plants may now be divided if it is desirable to increase the stock. Bulbous plants should not be disturbed now, otherwise the flowers will not be so good. It is best to remove all such plants in the autumn.

This is the best time to propagate *Phloxes*. The stools, if two or three years old, will have thrown-up a number of shoots; all of them may be removed except five. The cuttings may either be put in out of doors or in pots. If the former, a bed should be marked out, and 2 inches of fine mould placed on the surface; the cuttings may then be put in 3 inches apart and 6 inches between the rows. If in pots, it is best to put one cutting in the centre of a small pot, and then place the pots in a gentle hot-bed; when well rooted give air freely and shift into 5-inch pots, or plant in beds. When grown in pots the *Phlox* is very useful for decorating the greenhouse or conservatory in autumn.—J. DOUGLAS.

#### TO CORRESPONDENTS.

N.B.—Many questions must remain unanswered until next week.

NAMING PLANTS.—We are most willing to name plants, and have superior botanical aid for the purpose; yet, even under the most favourable circum-

stances it is difficult to discriminate any one species of a numerous genus. We therefore ask those who wish us to name plants to send their specimens in a small box; the postage is either nothing extra or trivially increased. We have just received specimens of rare *Orchids* literally smashed by the post-office punches, so as to be totally unidentifiable.

**POISONING MICE (W. C.).**—We do not know the process of preparing poisoned wheat for destroying mice, nor have we found the poisoned wheat so readily taken by mice as ordinary rat poison, which may be had of any chemist. We melt some lard and with oatmeal form a kind of dry paste, which we place in their haunts for two or three nights; afterwards we mix poison with lard and oatmeal prepared in the same way, and place it in their haunts, taking care that no domestic animal can partake of it. The mice will usually take the poison, but rats are more fastidious, and are best enticed for a few nights prior to placing the poison. Both rats and mice are more effectively poisoned by feeding them for a few nights before putting down the poison.

**TOMATOES IN CUCUMBER HOUSE (C. S.).**—The temperature of a Cucumber house is not too warm for Tomatoes, and the seed-leaves falling prematurely is rather to be attributed to dryness than to the moisture of the house; but we should say it had resulted from a sudden check the plants had received. The plants do well trained to the back wall and on the roof. It is not advisable to syringe Cucumbers when the house is shut-up for the day while the sun is full on them; but the house, floors, walls, and other surfaces should then be sprinkled with water of the temperature of the house.

**VINE BORDER COVERING (T. Goldsmith).**—The border having been covered up since November will be dry—too dry. We should therefore remove the covering, thoroughly moisten the border with water at 60°, and then put on the fresh horse droppings you have, and tread them firm. If they are so thick as to raise a gentle heat all the better. Cover-up with the boards, and they need not be removed until April, when you may again water, and this time with water at 70°, and on the droppings, so that nourishment will be carried down to the roots. We should put on the boards for at least another month, again remove and water, and every fine day remove the covering, replacing it at night and when heavy rains prevail. Remove it by degrees, so as to entirely disperse with it in June.

**POTATOES FOR STIFF SOIL (Idem).**—Myatt's Ashleaf for early, Dalmahoy for second, and Walker's Regent for main crop. You will require about a bushel of Myatt's Ashleaf, two of Dalmahoy, and four of Walker's Regent, but much depends on the size of the sets, and we may not have hit your demands for early supply, but you can remedy that by altering the quantity to suit your needs.

**AMARYLLIS AND LILUM FROM SEED (W. N. C. H.).**—The cause of the seed failing is, no doubt, your having kept it too long out of the ground. The seed should be sown as soon as it is ripe, or be kept in silver sand until spring, and sown (the earlier the better), in pots or pans filled to within about half an inch of the rim with a compost of fibrous loam, peat, and leaf soil in equal proportions, with a sixth of silver sand, draining efficiently, and having the surface fine and even. Scatter the seeds evenly, and cover with fine soil to a depth equal to the diameter of the seeds, and place in a hotbed or house with a temperature of 65° to 75°, and keep moist. When the *Liliums* are up keep them near the glass, by degrees harden them off and remove to a greenhouse, and by autumn they will have formed small bulbs, and may be potted-off singly. The *Amaryllis* should be continued and grown-on in heat, not drying them off in winter, but keeping them moist, yet not so moist as when in growth, and pot-off singly when they are growing freely; encourage growth by a moist atmosphere and brisk bottom heat. In about three years they may be had in a flowering state.

**EPACRIS AND ERICAS AFTER FLOWERING (Inquirer).**—In a cold greenhouse *Epacris* should flower in February, but we think by a cold greenhouse you mean one from which frost is excluded, and in such they may flower somewhat earlier. After flowering they should be cut-in to within about an inch of the old wood, and the *Ericas*, if of the winter-flowering kinds, should be trimmed-in so as to form compact plants, but leaving some small shoots; in fact, merely cut-in the long straggling growths. Water moderately, but encourage growth by a tolerably close and moist atmosphere, and if the plants need potting it should be done when the young shoots are about an inch long, merely loosening the sides of the ball, draining the pots well, and keeping the neck or collar of the plants high in the centre of the pots. Shade from bright sun for a few days after potting, and after that admit air and light, of which these plants can hardly have too much. Water only when the soil becomes dry, but before the plants flag, then give a thorough supply. Sandy peat soil is the only suitable compost. The *Camellias* should be repotted, removing any old soil coming away freely from the roots, which must not be injured. Use a compost of the top inch of a pasture or common where the soil is light and sandy, and turf torn-up rather fine but not sifted. Pot very firmly, and finish-off with the finer portions of the compost. The neck of the plants should be level with the rims of the pots, and the soil should fall towards the rim so as to leave space for water. Water abundantly when the plants are growing, and at all times keep the soil moist, avoiding, however, making it sodden by needless watering. In hot and bright weather *Camellias* are the better of a slight shade.

**PEACH CULTURE (A New Beginner).**—The stoning period is when the Peach has attained to about half its size, and the shell of the seed is forming. The "Fruit Manual," price 4d., and Pearson's "Orchard House," price 1s. 6d., would suit you. They can be had by post from our office.

**HEATING VINERIES (Cosmos).**—The "large vinery" planted throughout with late varieties, 150 feet long, 21 feet wide, and 15 feet of rafter, will be efficiently heated by two rows up both sides of the house and across one end; and you should not have less, as it is not good for the Vines to heat the pipes highly, and this is a waste of fuel. There is no greater mistake than to make a quantity of piping, which to maintain the required temperature requires to be made very hot. The pipes, we presume, are to be level, and 9 inches to a foot clear of the border. We should arrange to have the valves all on the side of the house next the boiler, and directly the pipes enter the houses, and on the main flow and return pipe, in each case so as to completely shut off the water: thus you will only need two valves for each division. The main flow should in this case be branched as soon as it enters the house, as also must the return pipes; and after they divide you can put in the valves, and you will thereby be able to heat one house or the other separately or together as wished, and without any piping being needlessly heated, as would be the case were you to have the valves on the opposite side of the house to where the water enters the house, and as your sketch indicates. In other respects the heating proposed is satisfactory. The other vinery in three divisions will be best heated by 4-inch pipes (unless you wish to save fuel, when a less dia-

meter of pipe with the same heating surface would be better), as the Hamburgh house will be forced, and the Muscat house requires a good heat. The Lady Downe's house ought also to have four rows of piping, as the Vines require strong heat, and we should heat somewhat differently from what you show. We would branch from the main, directly entering the Muscat house, for the Hamburgh house, and have valves on both the flow and return pipes for that house, branching in the Hamburgh house as you show. We should not take the pipes across the end of the Muscat house where the pipes enter, nor across that end at all, but turn to the right and take the pipe up that side to the top, and continue it into the other house (Lady Downe's), but with an elbow at the end of the Muscat house, and continue across the end and up the other side, and thence return by the same route or alongside the flow pipe by a return to the place whence the main flow branched or divided; and there an elbow or branch must be introduced to take the return pipe from the Lady Downe's house, and thence alongside the flow back to the boiler. Continue the flow round the Lady Downe's house, and take a return alongside as in the Muscat house, omitting in both cases the end where the water enters. You will need a valve on the flow and return of Lady Downe's house, and on the flow and return of the Muscat house where it crosses the end, so that you can reduce the heat in the Muscat house to a minimum when the Lady Downe's house is to be heated and not the Muscat house; and you can have a valve on the flow and return pipes of the Muscat house directly on leaving the main, by which you can keep both the Muscat and Lady Downe's houses cool when the Hamburgh house is being forced. By the valves you can regulate the heat to a nicety, but have good screw valves of the best make. Our boiler's flow pipes have 1 foot 6 inches rise direct from the boiler, but a foot is as good as a yard. It makes no difference to the circulation of the water; but we advise you to make the water flow the reverse way to the general principle—let the pipes be all flows, and, when the pipes fall, fall at once directly to the return pipe of each house, and the main return direct to the bottom of the boiler. This gives an impetus to the circulation, and better circulation with more uniformity of heat throughout the pipes. Three-inch pipes will certainly give you the heat you need, but you will at times require to heat the pipes more than is good for the Vines; therefore we advise a large amount of piping in preference to a small amount and hot, both for economy in fuel and for successful culture. We would further state, that fuel being a great consideration, we should seek to reduce its consumption, and therefore have to point out that were you to use 4-inch pipes only for the main flows and returns, and heat the houses with 2-inch instead of 4-inch piping, having four 2-inch instead of two 4-inch, you would have the same amount of heated surface and only half the quantity of water. For instance, a 4-inch pipe 15 feet long contains eight gallons of water; a 2-inch pipe 15 feet long contains two gallons. In this way you would have a greater first-cost in pipes, but the money would give a good interest in saving fuel by there being only half the quantity of water to heat.

**TAN NOT HEATING (J. H. L.).**—The tan is probably old, and as you say "refuse." Very likely it will not heat, for it ought to have done so in the time you name. Part of it may be Larch bark, which is now much used in tanning but is not nearly so good for heating purposes as Oak; indeed, some we had has not heated at all. The only thing you can mix with it is some fresh tan from the pits. This will, no doubt, cause a gentle heat.

**POT VINE PRUNING (Idem).**—If you intend to keep the Vine in the pot and so fruit it, it should not now be pruned, nor, indeed, if you plant it out; but you may depress the cane so as to make it break regularly, and as they show rub off the shoots from the ground to where you want them, leaving two or three for side shoots, and one for a leader to be trained up the rafter. The cane can be cut back without fear of bleeding when the Vine has made leaves. If you fruit it this year in the pot leave it at its full length. So long as the wood is not broken the cane will not be the worse of being bent, though if twisted so as to splinter it will bleed at that part.

**PLANTS FOR CRAGS AND ROCKY GROUND (E. O. B.).**—The following are rock or alpine plants, and will, no doubt, succeed with you if looked over occasionally so as not to be overgrown by the natural vegetation:—*Alyssum saxatile* and var. *compactum*, *Ajuga alpina*, *Anemone pennina*, *Antennaria hyperborea*, *Antirrhinum*, *Arabis alpina*, *A. alpina*, *A. bellidifolia*, *Arenaria verna*, *Ambrosia deltoidea grandiflora*, *A. greenii*, *Campanula garganica*, *C. Jamesoni*, *Cerastium tomentosum*, *Cheiranthus alpinus*, *Cistus formosus*, *C. algarvensis*, *C. Islandicus*, *Cyclamen Cornu*, *C. neapolitanum*, *C. europaeum*, *Daphne Cneorum*, *Draba aizoides*, *Erinus alpinus*, *Erythraea aggregata*, *Genista prostrata*, *G. triquetra*, *Centiana caulis*, *G. verna*, *Glechoma hederacea variegata*, *Helianthemum cnam*, *Iberis saxatilis*, *I. Tenoreana*, *Lepidium rupestre*, *Linaris alpina*, *Lithospermum fruticosum*, *Meconopsis cambrica*, *Papaver alpinum*, *Phlox Nelsoni*, *P. verna*, *Lotus corniculatus flore-pleno*, *Saxifraga alpinus*, *aizoides*, *caryophylla*, *Cymbalaria*, *longifolia*, *palmaria*, *oppositifolia*, and *umbrosa*; *Sedum acre*, *anglicum*, *kamtschaticum*, *Eversii*, *pullidum*, *roseum*, *glauca*; *Silene acaulis*, *Scempervivum arachnoideum*, *S. californicum*, *S. globiferum*, *Statice alpina*, and *Vincas herbacea*, major *gigantissima*, minor, and minor *plena*.

**ALPINE STRAWBERRY SEED (Carolus).**—Write to the seedsmen who advertise in our columns.

**ANNUALS FOR CUT FLOWERS (H. D.).**—We presume you want hardy annuals such as *Alyssum maritimum*, *Asperula azurea setosa*, *Calliopsis Burridgei*, *C. marmorata nana*, *Candytuft*, *crimson*, *sweet-scented*, and *White Rocket*; *Centauria Cyanus major* and *minor*; *Centranthus macrospilon*, *Chrysanthemum Burridgeanum*, *C. Dummerti flore-pleno*, *Collinsia bartels-folia*, *Erysimum arkansanum*, *Gilia tricolor*, *Goleitia roseo-alba*, *Helichrysum bracteatum* and *monstrosum* in variety; *Larkspur*, *Branching* and *Rocket*; *Leptosiphon densiflorus* and *densiflorus albus*; *Love-lies-bleeding*, *Lupine*, *blue*, *white*, *rose*, and *yellow*; *Lupinus nanus*, *Mignonette*, *Tom Thumb Tropaeolum*, *Invincible Sweet Pea*, *Double Dwarf Scabious*, *Schizopetalon Walkeri*, *Senecio elegans*, *Sweet Sultan*, *purple*, *white*, and *yellow*; and *Whitlavia grandiflora*. *Collinsia bicolor* may be sown rather thinly in light rich soil—in loam and leaf soil—and placed in a cold frame, and the plants thinned-out to an inch apart, watering as required, and admitting abundance of light and air. *Rhodanthé Mandesii* sown in a smaller size of pot, say 3-inch, placing about half a dozen seeds in a pot, and using a compost of equal parts of fibrous loam, leaf soil, and sandy peat. Put the pots in a hotbed and near the glass. Shift into 6-inch pots, keeping the ball entire, and not covering lower than the seed leaves; water moderately and afford a light airy position in the greenhouse; or the plant may be turned out of doors in a sunny exposure in light rich soil.

**DENDROBIUM HEDYOSMUM CULTURE (Glenbrook).**—The flowers are greenish white when they first expand; they afterwards become almost pure white, and are delicately fragrant. This species, like the majority of the Burmese *Orchids*, requires strong moist heat to grow in, and consequently we fear, with only a cold greenhouse at your command, you cannot hope to be suc-

cessful in its cultivation. It would be much better to exchange it with some of your neighbours who possess a stove. The plant in question should be fastened upon a block of wood with just a little sphagnum moss, and until it begins to root and grow a little it should be hung-up head downwards; this will prevent water lodging about the eyes and rotting them, which often occurs when newly-introduced Orchids are subjected to the same treatment as those already established. In answer to your query respecting the introducing of Orchids, we may say that good, new, or rare species would pay to import; but it generally happens that those persons who send home Orchids to their amateur friends have no knowledge of what kinds we have in cultivation in Europe, and, in addition, generally send those easiest to obtain; and the result is, that amateurs' consignments seldom realise the cost of the freight. On the other hand, if your friends have a good knowledge of these plants and can send you home new or rare kinds, we should advise you to make the venture.

**POINCIANA REGIA CULTURE** (*Idem*).—It certainly must be kept in strong moist heat, and cannot be successfully grown out of stove heat. When growth is completed these plants require a good dry season, or season of rest; but amateurs, and indeed professional gardeners, too often forget their plants are in pots, and when they treat them to a thorough drying-off as it is termed, they destroy every particle of roots the plants have. This, however, does not occur in a state of nature; the roots are not exposed all round to the dryness of the atmosphere, and although the surface soil may be well parched and baked, there are sure to be some roots deep down in the soil where moisture is to be found. The above error, we are truly convinced, is the reason we usually fail in the cultivation of many beautiful plants from what are termed dry countries.

**GRAFTING WEEPING ASH** (*M. E.*).—Take off the scions now, keep with the ends in moist clay, and graft at the end of March, or if then cold during the first mild weather in April.

**DAPHNE INDICA CULTURE** (*Idem*).—Use a compost of equal parts of peat and loam, with one-sixth of silver sand. The peat and loam should be fibrous and torn-up rather fine, and afford good drainage. Repot when the plant commences growth, and keep rather moist and shaded when making fresh growth, otherwise afford a light airy position. It is not unusual for the plant to have yellow leaves at this season, but if last year's leaves are so affected we should place the plant in gentle moist heat and encourage growth. The roots are probably in a wet sour soil; remedy it at once.

**HYDRANGEA JAPONICA** (*Idem*).—Cut down now, but leave sufficient of the ripened shoots for flowering, which they will do in a greenhouse in July, or earlier according to the temperature. The plants should be potted when they commence growth, or now; in doing so remove as much of the old soil as can be taken away without injuring the roots, repot in the same or a larger size of pot, and when this is full of roots shift into a size larger. Water abundantly, affording a light airy position. Beyond pegging-down and tying-out the shoots no other treatment is required.

**LAWN MOWERS** (*E. R. P.*).—You will obtain all particulars if you write to the makers, Blackfriars Road, London.

**NAMES OF FRUITS** (*T. F.*).—The Apple is the Winter Codlin, and the Pear March Bergamot.

**NAMES OF PLANTS** (*W. A. E.*).—We are sorry that the flower between the leaves escaped our notice, it must have been smashed flat. The shoots had only leaves on them, and we cannot undertake to name plants unless their flowers are sent. Specimens should be in a box.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### CONDITION.

Some weeks ago a correspondent expressed the opinion that both myself and the judges laid far too much stress on the condition of fowls at shows, adding the curious assertion that nothing was so easy of attainment! That does not seem to be the general experience, however; and I can call to mind many occasions when I have seen pens of really sterling merit compelled to occupy an inferior position because they were not in good show trim. Such birds are not unfrequently "claimed" by knowing judges, and the former owners feel a little natural vexation to find them score a succession of triumphs in more skilful hands. I propose to say a few words upon this subject, in the hope that they may bear fruit before the next show season.

First of all, of course, good condition implies good health. There may be health without good condition; but without health really good condition is impossible. And when fowls have a good open grass run in clear country air which has no smoke to dirty the plumage, if they are even decently fed and cared for, they attain, without any trouble at all, a condition which leaves nothing to be desired. Their combs are bright, their plumage clean and close, their carriage sprightly and vigorous. And it is only fair to say that some of our "leviathan" exhibitors owe most of the bloom in which they show their birds very much to these great natural advantages. Mrs. Arkwright, Lady Gwydyr, Mr. Lingwood, Mr. Maynard, Mr. Beldon, and many others—all have clear country air and country grass to aid them; and all who have these need very little more. I might go further, and say they need *nothing* more beyond seeing that the arrangements in the houses, &c., are such that the plumage never gets damaged, and especially that there is nothing to catch and injure the tails of the cocks. In such circumstances I would not advise iron, or tonics, or any artificial treatment whatever.

Even a limited grass run, such as can sometimes be had near a town, will do much towards success. Such I now myself enjoy, and I get with hardly any trouble much better condition than I could at Bristol, where I had none, and had not time for the necessary treatment in lieu of it. All needed even here will be

to give such feeding as shall result in vigorous health, and then wash the fowls as required, on which we shall have a word or two by-and-by.

In strict confinement it is that the difficulties begin; and here it is that, in my opinion, and according to my experience, the replies often given to correspondents are somewhat at fault, various things being again and again denounced as "quackery" which are really valuable aids. To take certain tonics, for instance. Fowls in a state of nature do not need them. But there is in a Hare or a Pheasant, as everyone knows, an aromatic flavour, which shows that they get naturally something very analogous to such spices as we are considering; and we know also by personal experience that we cannot live healthily upon the same diet when following sedentary occupations as if engaged in an out-door life. Nay, the very "ground oats" or any other soft food, as so constantly recommended, is so far quite "unnatural" to a fowl; it is simply found better adapted to the domesticated animal. Even to fowls thus confined, however, I do not advise tonics to be given regularly—only in cold, or wet, or moulting seasons, or when "getting into condition," which brings me back to my immediate subject.

The object as regards diet must still be the same—viz., to maintain the most perfect health; and I assert fearlessly, that as regards all breeds adapted for confinement this consists in giving rather less than most people give of soft food and grain—keeping the fowls rather spare, in fact—but giving a little cooked meat regularly, and plenty of green food every day. If worms or insects can be obtained instead of meat all the better, and a very little is sufficient, while much is actually injurious. Health can be maintained without any meat at all; but all who remember how constantly a fowl is seeking for insect food when at liberty, and how much it obtains, will readily believe me when I say that a little is needed for that highest degree of health and spirits which we are considering. In most cases table scraps helped out with pot liquor will give all that is needed. As to green food, of any that can be got they can hardly have too much; and if none can be procured, minced turnips may be substituted, and when the birds tire of this the turnips can be boiled and mixed with meal. But really green food is much the best; and as the result of all, the birds should be kept just a shade thin; hungry, healthy, happy, with bright red combs, and a slightly sharp breastbone, but with good hard flesh on each side of it. Such a bird, if its house has been arranged with the same precautions as to damaging its plumage, however small that house and run may be, can be shown in the very height of condition.

I may be contradicted here. I have again and again heard it said that birds "have to be" fattened-up to an unhealthy state in order to stand a chance of winning. I reply without the least hesitation that this is not now the case, whatever it may have been; and that this mistake is one of the reasons why so many people fail. They have heard people must so fatten, and they try to do it, and spoil their birds. I see even noted exhibitors do it, and I grant they often win; but it is in spite of it, and a very large proportion of the very best birds each season are shown in thoroughly hard feather, and are bred from with perfect success after. I never fattened a bird for show in my life, and for one who exhibits so little I have had fair success. No! feed your birds only as much as will keep them healthy—no more. So fed, the meat and the green food will keep the plumage close and the comb red, which cannot be got in confinement without these items of diet.

Then, some four, or even only three weeks before the show season commences, you may, if you desire, give a little preparation. Feed a *very little* more, adding to the soft food a *very little* of any aromatic tonics in powder—say a mixture of gentian, ginger, and aniseed—beginning with a *very little* indeed, and ending with only enough to give a slight flavour. And every three days mix the meal with linseed steeped into a jelly instead of mere hot water, which will add greatly to the gloss on the plumage. But still, never overfeed the appetite: I say only "a little" more, remember, not much.

Then a week before the show examine your birds. Barring misfortune, they should and will be sound in feather, healthy, hearty, with a rich gloss on the feathers, but very likely dirty. And it is here that perhaps most amateurs fail, by omitting to provide what is an absolute necessity for showing birds in confinement with credit—namely, some place where they can be kept clean. If a spare room littered with soft straw can be given, that will do; but on the whole I prefer either a pen, some 6 feet square, floored with perfectly clean sand, or pens like show pens, only 3 feet square. These last are most convenient, and get the fowls used to confinement, which is important; for most young birds are very wild when first confined, and if then sent to a show almost always destroy their tails, and so lose their chance; whereas about three days in a larger pen about a yard square, and with no one to frighten them till they have calmed down a bit (after which they should be visited and petted as much as possible), will make them perfectly quiet and save their beautiful plumes.

If the birds are dark in colour they will not usually need

washing, but a clean handkerchief held in the steam of boiling water and smoothed over the feathers while slightly damp will remove much dirt, and the rest will, in most cases, disappear during a week's confinement in the pen, which should be littered with either sawdust or clean straw-chaff finely cut, and cleaned out regularly every morning and evening. Those who have never tried it will wonder how rapidly a fowl gets clean when thus penned-up for a short time in a clean place. But white birds, or which have white about them, or buff, will need washing. Now here again the mistake of most amateurs is that they never attempt to wash a fowl till they want to send it to a show, when they are pretty sure to "make a mess" of it. They should try once or twice on their commoner birds first, by which they would get experience and confidence, and come out all right. I would begin with a cock, which is much easier to wash than a hen, as his narrow hackle feathers do not need to be web again so perfectly in order to look well; and moreover, in many breeds, it is only needed to wash part of him, such as hackle, saddle, back, and wings. In such cases a good, solid, rather rounded nail-brush is the thing. If the bird is white, first blue the water. I do not consider this "dyeing"—in fact, if there be enough blue to dye the bird at all, the white is spoilt, of which there were some curious examples in the Silky class at the last Palace Show: but a little blue (and even that little looks very blue in the pen) gives a wonderful brilliancy to a good white bird, and every exhibitor is considered to have a perfect right to use it, as all the good "washers" certainly do. Make the water comfortably warm, and first of all scrub the head and comb well and briskly with soap and water. Then with the sponge wet as much as you can the hackle, back, and saddle, after which pass the soap over it a few times, and then after well soaping your nail-brush, rub it sideways repeatedly over every part till you judge all the dirt is off, always brushing straight down the feather, and taking no pains either to wet down to the skin or to avoid doing so. When you have done, while your assistant (to thus partially wash a bird requires one, though not to wash him wholly) holds him over the pan, you must sponge the soap off plentifully, letting the water stream out of the sponge till you are sure all the soap is out; after which you have no more to do than wipe-off as much as you can with the sponge squeezed dry, and put the bird in an ordinary show-basket, lined with linen or canvas, close by the fire till he is dry. A show-basket lined is best, because it keeps off and equalises the heat of the fire.

If you can have no assistant you may do very well by making in the middle of a jack-towel two cross-lits—thus, —|—, with about 4 inches between them. You pass the bird's legs and thighs through these holes, and then hang the towel by the ends to a hook in the ceiling or a joist overhead. You only need take care all the fluff feathers are nicely through the holes, and the bird, being helpless, is generally very quiet.

But hens, or birds light-coloured all over, need a thorough washing. Here, again, some of the directions given are at fault, for so long as you try to wet only the "surface of the feather," as I often see stated, you will never wash a fowl decently. I know, for I tried that plan myself till I was sick of it. No, you must stand your bird in the water. In fact, you had better have two pans, one full of good strong soda. Anyway, you must wash thoroughly, but in this case with a sponge, not using the brush, which would prevent all but hackle feathers webbing again. You only need take care not to rub the wrong way; with this exception, wash as much as you like, and be sure the plumage is wet through. The water being warm, the bird may faint, in which case there is no cause for alarm, as a dip in cold water will almost always revive it. The head should always be well scrubbed with the brush, however, as nothing sets off a bird more than a nice bright comb and clean head. When clean all soap must be washed thoroughly out as before, for which two distinct tubs or "waters" are much the best and most certain, while a little borax in the water also assists to get the soap thoroughly out. This is the essential point, for if any, even the least soap remain, the feather in that part will appear draggled, and will not web properly; but if well cleaned, by next morning, or when dry, all will be right again, with the exception that the gloss will have been removed by the washing. That is just the reason why the operation should be performed some days before the show; for in that time, with the help of the linseed, there will be a fresh secretion of oil, and the birds being kept perfectly clean in the pen, will be in the very height of condition. For white or buff fowls gloss is of less importance, and these are very often washed the day before showing. Many birds, if kept in proper hard plumage, would not need washing; but a loose-feathered bird always becomes comparatively dirty. On the other hand, such birds as Cochins, even though clean, are often washed merely to increase the apparent size, as washing causes the fluff, and, indeed, the whole plumage, to "stand out" more than it did before.

Birds bred in confinement cannot be shown often with success, or even safety; once in three weeks or a month is enough. I know a contrary opinion popularly prevails; but I also know

that while many exhibitors do exceed this rule, they suffer the penalty. One well-known exhibitor has had several birds returned to him dead this season, and I have many times seen beautiful birds which could barely stand, while the barrenness of celebrated hens has become almost proverbial. Short of this, the pale flabby comb and listless air tell sad tales; and so far from agreeing with the correspondent I referred to at the commencement, that judges lay too much stress upon condition, I think they would do well to lay more—so far, at least, as to disqualify far earlier than they now do for evident signs of over-showing. They might by this offend one or two, but I believe they would give satisfaction to the great body of exhibitors and to all real breeders of fowls; and though I can never join in the outcry against people "winning everywhere" with birds they have "bought at any price," and never have joined in it, believing that by their spirited purchases they are one of the great supports of "the fancy," I do think that so far as I have now suggested the judges might and ought to go in mere humanity, and that as soon as their intention to do so was clearly understood the whole body of fanciers would feel grateful. I must say that I have seen prizes won this season by birds whose "condition" did not deserve it, and which was to a humane man or true fancier really pitiable; that birds have, in fact, won prizes no bird could win and remain in health; and I need hardly point out that this might be checked without any change in the wholesome maxim, "Let the best bird win," and that so doing would open the doors of the prize lists to a larger number of really good birds, and so encourage other fanciers. I do not complain of any particular judge. The line between fair condition and "overshown" condition cannot be a very marked one, and all I suggest or ask is that the judges draw it rather tighter. I believe that in so doing they would be serving the best interests of all.—L. WRIGHT.

### THE BROMLEY PRIZE CARDS.

A QUESTION was asked some time ago in the Journal previous to the Bromley Show whether it was a *bona-fide* concern, and a prompt reply given that it was. Doubtless the answer was correct. The Show has been held, and the prizes paid; but on receiving my money I found that I had been mulcted of 1s. for each prize—and for what? For my prize card! Now when the Society issued its schedule, amongst other inducements held out to exhibitors was one that their cards would be printed in gold on leather, and with a representation of the particular breed for which the prize was given. I do not suppose that any person was induced to exhibit by such a tempting bait; but neither do I suppose that anyone imagined that this wonderful gift was to be had at the exhibitors' expense. But the Committee of the Bromley Show are an ingenious body; they have had these cards printed on American cloth, and have, I have no doubt, turned an honest (?) penny by the transaction. Now I look upon this as a regular "do," and were the matter worth it I would resist *vi et armis*. I should add that the card is a most trumpery affair, the gilding very faint and rapidly vanishing away. Might it not be well to ask the Bromley Committee whether they would object to receiving them back, and wear them whenever they meet for consultation? It might be regarded as a delicate compliment paid by the exhibitors.—D., Deal.

CLAIM FOR SHOOTING A PIGEON.—Blackburn County Court, before W. A. Hulton, Esq., Judge. *Fish v. Bury*.—The plaintiff sought to recover the sum of £10 for a Pigeon. The plaintiff said about four years ago he bought a Pigeon, and gave £5 for it. It was a Black Dragon. It was the best Pigeon in Darwen for flying matches. He had won about £100 in matches since he had it. On the 19th of January it was matched to fly for £15 a side. He had paid £1 for training it for the match. He had also paid £4 as a deposit. He had lost that money in consequence of the Pigeon not flying. He had been offered £10 several times for it, and would not take it. J. Howarth said that he was requested to watch which way the Pigeon flew. He went to the top of a hill near at hand, and he saw the defendant shoot the Pigeon, and he then waved his hand, and his dog brought the bird to him. Witnesses gave evidence to show that the bird was worth £10, that it had cost over £25 in training, that it had flown over one hundred matches during the last four years, and that it had beaten every Pigeon in Darwen, and had flown matches at Bolton, Horridge, Bury, and other places. His Honour gave a verdict for the plaintiff for the full amount.

COCHIN-SPANISH HEN.—It is a first cross between a Cochin and Black Spanish. She commenced to lay on December 24th, and, with few exceptions, has laid a larger than an average-sized egg every morning. On Friday morning (February 13th) she laid an egg measuring 8 inches longitudinally, 6½ inches in circumference, and weighing 4½ ozs., and has laid every morning since up to the time of writing (February 16th). She is also an excellent sitter and mother, having brought up two broods of

of the Show. At any local meeting it is difficult to find *Turkeys* and *Geese* of equal merit to those entered at Kettering; but it should be borne in mind that mixed colours in the Geese constituting a show pen are not allowable, however otherwise as individual birds they may be praiseworthy.

The weather proved favourable. The Committee were most desirous to please everyone, and the visitors were quite as numerous as could be expected.

Though the *Pigeons* were limited in number, as might be expected from the season being advanced, the classes of Pouters and Carriers were exceptionally good. A local exhibitor, Mr. Martin, took the cup with a beautiful White hen in excellent condition and show, and a first prize with his White cock, closely followed by an excellent Blue-pied. In Carrier cocks Blacks were first and second. In hens the first prize went to an excellent Black. A very good pair of Archangels in the Variety class won a cup.

**DORKINGS.**—Any variety except White.—Cup, Henry Lingwood, Barking, Needham Market. 2, F. Parlett, Great Baddow. 3, E. W. Southwood, Fakenham. *hc*, A. S. Clarke, Lowestoft; T. E. Oldham, Loddington Hall, Kettering; J. Holme, Loddington. *White*.—1, Rev. F. Tearle, Gazeley Vicarage. 2, J. Robinson, Gazeley. 3, Miss A. Bayes, Kettering. *Cochins.*—Cinnamon or Buff.—Cup, Mrs. E. Allsopp, Hindlip Hall, Worcester. 2, T. Rogers. 3, H. Lingwood. *hc*, D. Young, Leamington; H. J. Gunnell, Milton; J. Bloodworth, Cheltenham; J. Staley, North Cottingham, Newark. *Any other variety*.—1, Mrs. E. Fryor, Welwyn. 2, T. M. Derry, Gedney. 3, P. Passmore, Northampton.

**BRAHMAS.**—Light.—1, Horace Lingwood, Creeting, Needham Market. 2, J. Bloodworth, Cheltenham. 3, A. F. Faulner, Thrapston. *Dark*.—1, Horace Lingwood. 2, W. R. Garner, Dyke, Bonine. 3, J. Watts, King's Heath, Birmingham. *hc*, H. W. Castle, Kensington; H. Goddard, Hertford Road, London, N.; J. S. Clarke; Mrs. E. Fryor.

**GAME.**—Black or Brown Reds.—1, H. M. Julian, Hull. 2, T. Hancock, Northampton. 3, R. Har. *hc*, B. Cox, Moulton; F. Winwood, Worcester. *Any other variety*.—1, H. M. Julian. 2, B. Cox. 3, O. Barnsdall, Newark.

**HAMBOURGERS.**—Gold or Silver-spangled.—1, Ward, Barton Hill, Ashby-de-la-Zouch. 2, J. P. Loe, Kingsbury. *Gold or Silver-pencilled*.—1, J. Robinson. 2, C. J. N. Row, Melford. 3, T. Wild, jun., Melton Mowbray. *hc*, E. Robinson, Kettering.

**FRENCH.**—1, J. Robinson. (No competition.)

**SPANISH.**—1, T. Boulter, Spencer Street, Clerkenwell, London. 2, J. F. Parker, Northampton. 3, Mrs. E. Allsopp. *hc*, T. Rogers. *c*, S. W. Hallam. *Any other variety*.—1, J. Robinson. 2, A. Silvester (Golden Poland); 3, J. Foster, Kettering (Black). *Any other variety*.—1, G. W. Boothby, Louth (Golden Poland); Miss Elencowe, Kettering (Langshans); J. Foster (Black Hamburgs); Miss Vernon, Kettering (Golden Poland); Rev. N. J. Ridley, Newbury (Malays).

**BANTAMS.**—Game.—1 and 3, Capt. Wetherall, Loddington. 2, T. W. Anns, Clapham. *hc*, Capt. Wetherall; D. Warren, Syston. *c*, M. Leno, Markyate Street. *Any other variety*.—1, M. Leno. 2, R. H. Ashton, Mottram. 3, Rev. F. Tearle. *c*, J. Watts.

**SELLING CLASSES.** *Cock or Cockerel*.—1, J. S. Clarke, Oundle (Dark Brahma). 2, T. Rogers, Walsall. 3, J. F. Parker (Spanish). *hc*, Miss A. Bayes (White Dorking). *c*, H. Holle, Kingsland, London (Light Brahma); Miss C. E. Palmer, Odham (Golden-spangled Hamburgs). *Hens or Pullets*.—1, T. Rogers. 2, Miss Vernon (Partridge Cochins). 3, T. Buraby (Dorking). *hc*, W. Nottage, Northampton (Spanish); W. E. Cave, Market Harborough (Buff Cochins); Mrs. E. Allsopp. *c*, G. F. Bentley, Linton (White Cochins); R. Sykes, Gedding (Dorking). *hc*, B. Cox (Game); S. Horn, Kettering; A. F. Faulner, Thrapston (Golden-pencilled Hamburgs); W. Birch, Barnack, Coventry (Brahma); P. Passmore (White Cochins).

**SELLING CLASS.** *Drake*.—1, T. Burnaby, Kettering (Ronen). 2, T. Plumb, Northampton (Aylesbury). 3, J. Harvey, jun., Thannington (Ronen). *Ducks*.—1, C. Richards, Glendon, Kettering. 2, M. Leno. 3, Sir J. B. Robinson, Kettering.

**DUCKS.**—*Rouen*.—Cup, F. Parlett. 2, T. Burnaby. 3, M. E. Jones, Wellingborough. *hc*, J. Harvey, jun. *Aylesbury*.—1, J. J. Sharp, Broughton, Kettering. 2, T. Plumb. 3, H. Wyman, Stilton. *hc*, R. J. Gunnell.

**TURKEYS.**—1 and 3, H. J. Gunnell. 2, M. Kew, Market Overton. *hc*, Rev. N. J. Ridley; C. Richards.

**GESE.**—1, M. Kew. 2, H. Wyman. 3, J. Sheffield, Geddington Grange, Kettering.

#### PIGEONS.

**CARRIERS.**—Cock.—1, H. Yardley, Birmingham. 2 and 3, W. Minson, St. Ives. *hc*, E. Beckwith, Bonnersfield, Sunderland; T. Chambers, jun., Northampton. *Hens*.—1, W. Minson. 2 and 3, E. Walker.

**POUTERS.**—Cock.—1, C. Martin, Kettering. 2, N. Hill, Ealing. 3, L. Watkin. *hc*, C. Martin. 1, L. Watkin, Northampton; W. Stiles, Rushton, Kettering. *Hens*.—Cup, C. Martin. 2, N. Hill. 3, F. Beckwith.

**TIMBLES.**—*Almond*.—Cock or Hen.—1, H. Yardley. 2, G. Packham, Exeter. 3, F. Beckwith. *Any other variety*.—Cock or Hen.—1, H. Yardley. 2, E. Beckwith. 3, J. Fielding, jun., Rochdale. *hc*, H. Yardley; J. E. Spence, Broughty Ferry.

**BARBS.**—1, H. Yardley. 2, F. Wild, Hyde, Manchester. 3, W. Larkins, Henlow, Biggleswade.

**JACOBS.**—1, T. W. Swallow, Northampton. 2, T. Homes. 3 and *hc*, C. Martin.

**DRAGONS.**—1, W. H. Smith, Walton, Liverpool. 2, W. H. A. Miller, Walsall. 3, W. Stiles, *hc*, H. W. Smith; W. Larkins. *c*, Young.

**FANTAILS.**—1, H. Yardley. 2, J. E. Spence. 3, S. Horn, Kettering.

**TURBITS.**—1 and 2, C. A. Crafer, Wallington. 3, C. Martin.

**ANTWERPS.**—*Short-faced*.—1, C. F. Copman, Capt. Heath, Solihull. 2, H. Yardley. 3, W. B. Bull. *Homing*.—1, R. Webb, Cambridge.

**ANY OTHER VARIETY.**—Cup, H. W. Webb, Lower Sydelham (Archangels). 2, A. Silvester. 3, H. Yardley.

**SELLING CLASS.** *Pur or Single*.—1, W. Nottage (Carrier). 2, G. J. Lenny, Lewes (Black Barbs). 3, W. Stiles (Dun Carrier). *hc*, Master S. Vernon, Grafton Vicarage, Kettering (Speckled Jacobins); G. Packham (Priests); W. H. A. Miller (Carrier); H. Yardley; W. Nottage; G. J. Lenny (Dun Carriers and Grizzled Dragons).

#### RABBITS.

**LOP-EARED.**—1, F. Banks, Doughty Street, London. 2, F. Purser, Bedford. 3, A. Ashmead, Northampton.

**ANY OTHER VARIETY.**—1, J. Martin (Angora). 2, J. Tebbutt (Patagonian). 3, F. Purser (Silver-Grey). *hc*, G. Johnson; J. Martin (Angora); G. Foster, Northampton (Dutch).

**SELLING CLASS.**—1, F. Banks. 2, J. Hallus, Huddersfield. 3, G. Johnson.

The Judge for poultry was Mr. E. Hewitt, of Sparkbrook, near Birmingham; and the prizes for both Rabbits and Pigeons were awarded by Mr. F. Esquilant, of Brixton, London.

**IMPORTANT TO FOWL DEALERS.**—At the petty sessions at Peterborough, a case of some importance to fowl dealers has

been decided. A butcher and a beehouse-keeper were fined 15s., inclusive of costs, for ill-treatment, which consisted in tying the birds by the legs in pairs, suspending them for sale, and carrying them in that position for about half a mile. The birds, when examined by the inspector of the Society for the Prevention of Cruelty to Animals, were half dead. The magistrates considered it a case of gross cruelty, and would have committed the defendants were they of opinion that the offence was knowingly committed.—(Land and Water.)

#### NANTWICH POULTRY SHOW.

THE fourteenth annual Show was held in the Town Hall, on the 6th and 7th inst. The entries were numerous, amounting to upwards of three hundred. The following awards were made:—

**SELLING CLASS.**—1, J. Powell, Newton Hall. 2, C. W. Laxton, Nantwich. 3, J. Platt, Swanlow. *hc*, W. Church, Nantwich.

**SPANISH.**—1, Mrs. Allsopp, Worcester. 2, S. L. Edwards, Tarporley. *hc*, A. S. Clarke, Lowestoft; T. E. Oldham, Loddington Hall, Kettering; J. Holme, Loddington. *White*.—1, Rev. F. Tearle, Gazeley Vicarage. 2, J. Robinson, Gazeley. 3, Miss A. Bayes, Kettering.

**COCHINS.**—Cinnamon or Buff.—Cup, Mrs. E. Allsopp, Hindlip Hall, Worcester. 2, T. Rogers. 3, H. Lingwood. *hc*, D. Young, Leamington; H. J. Gunnell, Milton; J. Bloodworth, Cheltenham; J. Staley, North Cottingham, Newark. *Any other variety*.—1, Mrs. E. Fryor, Welwyn. 2, T. M. Derry, Gedney. 3, P. Passmore, Northampton.

**BRAHMAS.**—Light.—1, Horace Lingwood, Creeting, Needham Market. 2, J. Bloodworth, Cheltenham. 3, A. F. Faulner, Thrapston. *Dark*.—1, Horace Lingwood. 2, W. R. Garner, Dyke, Bonine. 3, J. Watts, King's Heath, Birmingham. *hc*, H. W. Castle, Kensington; H. Goddard, Hertford Road, London, N.; J. S. Clarke; Mrs. E. Fryor.

**GAME.**—Black or Brown Reds.—1, H. M. Julian, Hull. 2, T. Hancock, Northampton. 3, R. Har. *hc*, B. Cox, Moulton; F. Winwood, Worcester. *Any other variety*.—1, H. M. Julian. 2, B. Cox. 3, O. Barnsdall, Newark.

**HAMBOURGERS.**—Gold or Silver-spangled.—1, Ward, Barton Hill, Ashby-de-la-Zouch. 2, J. P. Loe, Kingsbury. *Gold or Silver-pencilled*.—1, J. Robinson. 2, C. J. N. Row, Melford. 3, T. Wild, jun., Melton Mowbray. *hc*, E. Robinson, Kettering.

**FRENCH.**—1, J. Robinson. (No competition.)

**SPANISH.**—1, T. Boulter, Spencer Street, Clerkenwell, London. 2, J. F. Parker, Northampton. 3, Mrs. E. Allsopp. *hc*, T. Rogers. *c*, S. W. Hallam. *Any other variety*.—1, J. Robinson. 2, A. Silvester (Golden Poland); 3, J. Foster, Kettering (Black). *Any other variety*.—1, G. W. Boothby, Louth (Golden Poland); Miss Elencowe, Kettering (Langshans); J. Foster (Black Hamburgs); Miss Vernon, Kettering (Golden Poland); Rev. N. J. Ridley, Newbury (Malays).

**BANTAMS.**—Game.—1 and 3, Capt. Wetherall, Loddington. 2, T. W. Anns, Clapham. *hc*, Capt. Wetherall; D. Warren, Syston. *c*, M. Leno, Markyate Street. *Any other variety*.—1, M. Leno. 2, R. H. Ashton, Mottram. 3, Rev. F. Tearle. *c*, J. Watts.

**SELLING CLASSES.** *Cock or Cockerel*.—1, J. S. Clarke, Oundle (Dark Brahma). 2, T. Rogers, Walsall. 3, J. F. Parker (Spanish). *hc*, Miss A. Bayes (White Dorking). *c*, H. Holle, Kingsland, London (Light Brahma); Miss C. E. Palmer, Odham (Golden-spangled Hamburgs). *Hens or Pullets*.—1, T. Rogers. 2, Miss Vernon (Partridge Cochins). 3, T. Buraby (Dorking). *hc*, W. Nottage, Northampton (Spanish); W. E. Cave, Market Harborough (Buff Cochins); Mrs. E. Allsopp. *c*, G. F. Bentley, Linton (White Cochins); R. Sykes, Gedding (Dorking). *hc*, B. Cox (Game); S. Horn, Kettering; A. F. Faulner, Thrapston (Golden-pencilled Hamburgs); W. Birch, Barnack, Coventry (Brahma); P. Passmore (White Cochins).

**SELLING CLASS.** *Drake*.—1, T. Burnaby, Kettering (Ronen). 2, T. Plumb, Northampton (Aylesbury). 3, J. Harvey, jun., Thannington (Ronen). *Ducks*.—1, C. Richards, Glendon, Kettering. 2, M. Leno. 3, Sir J. B. Robinson, Kettering.

**DUCKS.**—*Rouen*.—Cup, F. Parlett. 2, T. Burnaby. 3, M. E. Jones, Wellingborough. *hc*, J. Harvey, jun. *Aylesbury*.—1, J. J. Sharp, Broughton, Kettering. 2, T. Plumb. 3, H. Wyman, Stilton. *hc*, R. J. Gunnell.

**TURKEYS.**—1 and 3, H. J. Gunnell. 2, M. Kew, Market Overton. *hc*, Rev. N. J. Ridley; C. Richards.

**GESE.**—1, M. Kew. 2, H. Wyman. 3, J. Sheffield, Geddington Grange, Kettering.

#### PIGEONS.

**CARRIERS.**—1, H. Yardley, Birmingham. *hc*, J. Chesters, Nantwich. *Dragons*.—1 and 3, S. Cliff, Nantwich. 2, J. Chesters. *hc*, G. W. Dutton, Chester.

**POUTERS.**—1, H. Yardley. *Barbs*.—1 and 2, J. Chesters. *hc*, F. Wild, Hyde. *Timbrels*.—*Short-faced*.—1, H. Yardley. 2, G. W. Dutton. *Long-faced*.—1 and 3, H. Ruscoe, Nantwich. 2, H. Yardley.

**FANTAILS.**—1, G. F. Lovelidge, Newark. *Jacobins*.—1, H. Yardley. 2, Master W. G. Forster, Shrewbridge.

**OWLS.**—*English*.—1, A. Smith, Halifax. 2, E. Lee, Nantwich. *Trumpeters*.—1, H. Yardley. *hc*, W. T. Massey, Nantwich.

**TURBITS.**—1, G. Cutler, Sheffield. *hc*, H. Yardley. *Any other variety*.—1, G. Cutler (Foreign Owls). 2, T. Gamon, Nantwich (Runts). *hc*, H. Yardley; R. P. Earwaker, Alderley.

**DOVES.**—1, Mrs. J. Hockenhill. 2, Master A. Hockenhill.

#### SPALDING COLUMBARIAN SOCIETY'S SHOW.

THIS was held on the 19th, when the annexed awards were made:—

**POUTERS.**—*Blue*.—Cock.—1 and 2, H. B. Massey. *Hens*.—1, H. B. Massey. 2, W. Andrew. *Red*.—Cock.—1, H. Simpson. *Any other colour*.—*Hens*.—1, H. Simpson. 2, T. H. Dows.

**CARRIERS.**—*Black*.—Cock.—1 and 3, W. Bulmer. 2 and *hc*, W. Massey. *Hens*.—1, 2, and 3, W. Bulmer. *c*, H. Simpson. *Dun*.—Cock.—1, W. Bulmer. 2, W. Massey. *Hens*.—1, W. Massey. 2, W. Bulmer. *Any other colour*.—Cock.—1, W. Massey. 2, H. B. Massey.

**BABBS.**—*Black or Dun*.—Cock.—1, 2, and *hc*, W. Massey. 3, H. B. Massey. *Hens*.—1, 2, and 3, W. Massey. *hc*, H. B. Massey. *Red*.—Cock.—1, W. Massey. 2, C. G. Cave. *Hens*.—1, W. Massey. *Any other colour*.—Cock.—1, H. B. Massey. *Hens*.—1, H. B. Massey.

**DRAGONS.**—*Blue*.—Cock or Hen.—1 and 2, H. B. Massey. *Any other colour*.—1, W. Bulmer.

**ANTWERPS.**—*Homing*.—1, 2, and 3, G. Shadford.

**TUMBLERS.**—*Almond*.—1, T. H. Dows. *Any other colour*.—1, T. H. Dows. *Short-faced Bards*.—1, Extra, 2 and 3, W. Woodhouse. *Short-faced Baldheads*.—1, 2, and 3, W. Woodhouse.

**FANTAILS.**—1, Extra, 2, 3, and *c*, H. Simpson.

**OWLS.**—*English*.—1 and 3, W. Woodhouse. 2, H. B. Massey. *c*, H. Simpson; W. Woodhouse.

**TURBITS.**—1, T. H. Dows.

**JACOBS.**—*Red*.—1, W. Woodhouse. 2, H. Simpson.

**TRUMPETERS.**—*Prize*, H. Simpson.

**RUNTS.**—1, T. H. Dows. 2 and 3, W. Woodhouse.

**ANY OTHER VARIETY.**—1, T. H. Dows. 2 and 3, H. Simpson.

#### BIRDS BREED IN 1873

**POUTERS.**—*Blue*.—1, Extra, 2 and 3, H. B. Massey. *White*.—1, Extra, 2, and 3, H. Simpson. *Red*.—1, W. Andrew. *Yellow*.—1, W. Andrew.

**CARRIERS.**—*Black*.—1, Extra, 2, W. Massey. 3 and *hc*, W. Bulmer. *c*, H. A. Ayton. *Red*.—1, Extra, 2, W. Bulmer. 3 and *c*, W. Massey. *Any other colour*.—1, W. Massey. 2, H. B. Massey.

**BARBS.**—*Black or Dun*.—1, Extra, and 3, W. Massey. 2, H. B. Massey. *Red*.—1, Extra, and 2, C. G. Cave. 3, H. B. Massey. *Any other colour*.—1 and Extra C. G. Cave.

**SELLING CLASSES.**—*Single*.—1, W. Massey. 2, H. B. Massey. 3, H. A. Ayton. *Pairs*.—1, W. Massey. 2, H. B. Massey. 3, *hc*, and *c*, H. Simpson.

#### RABBITS.

**LOP-EARED.**—*Dutch*.—1, A. C. Wiseman. *Duc*.—1, A. C. Wiseman. 2, R. Buffham.

BELGIAN HARE.—*Buck*.—1, A. C. Wiseman. 2, H. B. Massey. *Doc*.—1, T. H. Dows. 2, R. Buffham.  
 SILVER-GREY.—1 and 3, E. Brummitt. 2, R. Buffham. *hc*, E. S. Smith.  
 HIMALAYAN.—1, E. S. Smith. 2, E. Brummitt.  
 HEAVIEST.—1, R. Buffham. 2, E. Brummitt. 3, E. S. Smith.  
 JUDGES.—*Pigeons*: Mr. P. H. Jones, Ranelagh Lodge, Fulham.  
*Rabbits*: Mr. J. W. Harrison, Spalding.

### THE RABBIT FEVER.

WE are indebted to Mr. S. B. Pike, of San Francisco, California, for the information which we give in the extract which follows:—

"It may or may not be news to the fanciers on your side of the Continent to know that the Japanese have the Rabbit fever to that extent the chicken fever seems tame in comparison. Every steamer which has left this port for Japan for some weeks past has taken from 500 to 1000 head, which have sold there for all sorts of prices. I have the word of the first officer of the steamer "Great Republic," that he saw twelve hundred (\$1200) Mexican dollars counted down upon the ship's deck for one Rabbit! How is that for high?"—(*Pet-Stock Bulletin*.)

CAYENNE CANARIES.—A great deal of fuss has been made lately about peppering Canaries. The fanciers do not seem aware that in countries where cayenne grows out of doors the difficulty is to prevent the birds destroying the pods. I cannot see anything improper in indulging them in their natural taste. —F. C. HASSARD, *Sheerness*.

### THE COMMENCEMENT OF THE BEE SEASON.

AMID the discouragements and disasters of the past almost unparalleled unpropitious bee season, which are not yet fully felt and realised in all their magnitude, nor will be for some weeks to come, it is cheering to recognise in some of the writers in the Journal that indomitable courage and perseverance in following out the favourite pursuit, that not even the sad experiences of 1873 are sufficient to damp their ardour or cool their love. The apian motto must evidently be "*Nil desperandum*." Bad seasons, like good ones, often run in a series consecutively, so that we may now reasonably hope that after so many bad and indifferent bee seasons we shall be on the verge of a glorious future which shall change the whole aspect of affairs—a future pregnant with grand results, and in which our little favourites can, from the pure and unadulterated founts of nectar so richly supplied by Nature in her choicest flowers, fill our "crystal palaces" unaided by any of those devices which have so recently in these pages, for the honour of English apiculturists, been so justly condemned. Such at least are our hopes.

"Cease every joy to glimmer on my mind,  
 But leave, oh! leave the light of hope behind.  
 What though my winged hours of bliss have been,  
 Like angel-visits, few and far between,  
 Her musing mood shall every pang appease,  
 And charm when pleasures lose their power to please."

But, to pass from poetry to prose, many who would not be attracted by mere sentimentality on the subject will be instinctively drawn by the hopes held forth by your indefatigable correspondent, Mr. Pettigrew, who, as mounted upon the "paddle-box to pilot (as he says) the apian steamer for the next twelve months" in the Journal, holds up to view a £100 bank note (*a la* Gladstone with his financial budget before the nation) as his anticipated surplus profit in 1874, and therefore as an inducement to the apian crew to stand fast to their gear. I earnestly hope that Mr. Pettigrew will realise his heart's wishes, though we poor northerners would be content with comparatively smaller things.

It was on the 15th February that I observed the first pollen-laden bee enter one of my hives. On such occasions I always recall to mind good old Bonnar, who was one of the best practical apianists of his day. "The first day in spring (he says) that I observe a bee carrying a load I generally call my family together, to take a glass and rejoice with me and my faithful servants at the return of the salutiferous season." The witnessing the first load certainly excites the keen apianist, just as the first shot at the commencement of a battle excites the warrior. Such beginnings, small though they be, indicate that the season of repose is giving place to one of activity and industry, when great and combined efforts in the little community must be made to replenish their wasted stores and increase their diminished numbers; and for this end the ardour and perseverance of the little race is such, that not only is advantage taken of every favourable hour, but amid dangers and risks innumerable they hazard even life itself in the prosecution of their eager work. It will be remarked how different is the activity of the bee in early spring compared with that exhibited late in autumn when breeding is over. Pollen is the great object of search in spring in every well-conditioned hive, and a good criterion of its healthiness may always be formed by the number of pollen-

laden bees which enter it. This was a favourite test of Bonnar in deciding on the comparative value of any two hives, to count the number of pollen-laden bees that entered in a minute. This is a valuable hint to beginners in choosing a hive, especially when other conditions of age and weight are equal.

The past winter, being so mild and open, has told heavily upon the stores. I do not think I ever noticed such consumption. In an ordinary winter not more than from 7 to 10 lbs. are usually consumed, say from the beginning of October to the middle of March, but this winter the average month's consumption is much exceeded, so that some of my weaker hives are even now at starvation point. I fear, therefore, from the state of hives generally in the autumn, many will succumb to famine unless carefully examined and timely attended to.

For spring I recommend top-feeding for hives weak in bees, the bottle being chiefly used, or a piece of honeycomb placed on the opening at the top, and protected with any small super, in both cases to be closely wrapped with woollens and other appropriate coverings. This brings the food into close proximity to the bees, which in ungenial or cold weather is indispensable. In supplying populous hives with food I discard the bottle as the more troublesome method, and use for spring shallow zinc circular vessels of suitable size, with a central entrance tube, surrounded by a perforated wooden float, and all covered with a lid. For warmth cover over also with woollens, &c.

I cannot approve of careless feeding of any kind, and more especially of the practice of pouring the liquid food over the combs. This is objectionable in two ways: It encourages robbers, and is injurious to the hive itself. Bees, as a rule, dislike wetted dripping combs, and when so supplied largely, as is sometimes recommended, the bees are often dislodged from the "brood nest," and this is highly prejudicial to prosperity. Neither should bees be fed at the entrance-door by the use of a trough or otherwise, unless at night, as it may entice robbers. When adopting under-feeding at all I prefer inserting a trough laterally in a receptacle purposely scooped out in the floor board, away from the doorway altogether. This trough when not used is permanently placed in the floor board reversed. In spring every precaution must be adopted to prevent pilfering and attacks by robber bees. Careless feeding must be especially guarded against, and in all cases of annoyance by stranger bees no time should be lost in narrowing the doorway to the smallest possible dimensions.

I cannot close these remarks without cautioning beginners in bee-keeping against shifting their hives at this season of the year from one part of the garden to another. Mr. Pettigrew will excuse me if I doubt that his experience in this matter justifies the opinion he expressed under date 5th February, when he says that hives may at this season "be removed from one side of a garden to another with safety." Mr. Pettigrew must know that an opinion so expressed from the "paddle-box" is tantamount to a recommendation, and may lead some of the less experienced "crew" to adopt it. I have only to say that in all cases and circumstances such removals are to be condemned, and more especially at this inclement season. Many bees in every case are sure to be lost, and possibly even the hives themselves permanently damaged. We all know how invaluable even a few bees are at this early season, and therefore, as a rule, I strongly advise never to shift the site of a hive to a short distance. At all times, I repeat, it is bad practice, and at this season especially it is sure to be productive of disappointment and loss.—J. Lowe.

### FOUL BROOD IN HIVES.

(Concluded from page 177.)

I SEE, by the proposed schedule of prizes to be offered for competition at the Crystal Palace exhibition of hives, that £5 will be offered for the best essay on the cause and cure of foul brood. As the schedule is presented subject to alteration, perhaps I may be excused for suggesting that the prize be offered for the best essay on the cause and prevention of foul brood, for certainly there is no cure for it. We might as easily cure rotten eggs.

Frequently brood in this changeable climate is chilled to death and becomes foul. In spring and early in summer bees sit loosely over their combs, and spread their brood as widely as they can. A sudden change from heat to cold may cause the bees to creep more closely together, and thus expose some parts of the brood comb to the chilling influence of cold weather, and prevent the bees from properly attending to the brood. The cause here is not hidden. About eight years ago I went to Scotland in September, leaving three hives without sufficient food for the winter. When I returned I omitted to feed these hives till November. When I fed them the weather was open and warm, and the queens began to lay. In about ten days afterwards a severe frost set in and killed the brood. The bees were allowed to remain in these hives till the following March. The reader should, however, know that in nine cases out of ten foul brood is produced, not by chills, but by other causes not

well understood; indeed, foul brood is oftener found in hives that have been full and apparently long on the point of swarming than in hives not so well filled. Hives managed on the non-swarming system are more frequently afflicted with this incurable malady than those managed on the swarming system.

Let me repeat that dogmatic teaching on the cause of foul brood should not be attempted or expected. We are still ignorant as to the immediate cause of the Potato disease, and the cause of foul brood is equally beyond the ken of mortals.

A week or two ago one of our practical teachers in the poultry department of this paper told us that he kept sixteen hens, eight pullets, and eight a year older, and never kept any over two years old. This is the advice I would tender to bee-keepers. Let the half of your stocks of bees be from swarms, and seldom keep any beyond two years old. Thus you will not suffer much in your apiary from foul brood.—A. PETTIGREW, *Salcey, Cheshire.*

A NEW WEEKLY PAPER is announced for the special use and benefit of fanciers, or those who breed for exhibition any kind of pet birds or animals, such as dogs, poultry, Pigeons, birds, Rabbits, Cats, &c. It is to be called "The Fanciers' Gazette," and will be under the editorship of Mr. Lewis Wright, so widely known by his various writings on poultry.

### OUR LETTER BOX.

VARIOUS (I. N.).—We never feed our fowls on meat, beyond giving them the table scraps. We believe, wherever they have a good grass run they get enough of animal life for all useful or necessary purposes. We believe much mischief is done by overfeeding and by seeking out various foods. Excessive fat is not favourable to laying. If you mean to give meat, give it cooked. Raw meat induces cannibalistic habits. You may pinion the Dorking cock as you would any other bird—by cutting off the flight of the wing, but it will probably answer the purpose if you cut the feathers.

ABRAHAM COCKEREL DYING SUDDENLY (Norice).—You have no remedy against the seller. The bird would not have been highly commended by the judges had he not seemed in perfect health. We have never known fowls die of heart disease. They die of rupture of vessels on the brain. Cocks are more subject to it than hens, and it is more frequent at this time of year than at any other. We should set the eggs, and expect them to hatch, but we cannot think why you did not get another cock before.

EGG-EATING HENS (Subscriber).—The best advice we can give you is to sell or kill the hen. She will not give up the habit while she is with you, and it is more than doubtful if she will at all. You should remove her at once, as the others will acquire the habit.

PARENTAGE OF EGGS (C. G. Anxious).—If no other cock have access to the hens, we believe the cock fertilises all the laying. If another cock is admitted, it is then an undecided point how soon he may be supposed to have influence. You may wash your birds with soap and water, wiping the feathers downwards, and cleansing only the dirty—i.e., the outer part of the feathers. When they are clean put the bird or birds in a small open basket with plenty of straw, and stand them in front of the fire till they are dry.

ABRAHAM NOT LAYING (Agricola).—If you consider the weather we have had—the constant changes and great variations of temperature—you will hardly wonder that, being hens and not pullets, your Brahmas have not laid. Have a little patience and all will be well. We do not admire your feeding. Do away with the rice, potatoes, Indian meal, and raw meat; also with the wheat and oats. Give ground oats or barley meal morning and evening; some whole maize at midday; vary by giving the scraps. Give nothing more. We attribute half the complaints and disappointments of the present day to artificial and excessive feeding.

EXTENSIVE POULTRY-KEEPING (Tauri Caput).—You put it out of our power to advise you, because you do not describe your locality and premises. How large is the stackyard? What is the acreage you command? What food can the birds get beside that which is given by hand? Is thrashing always going on? Why do you make no mention of fowls? Do you intend to sell none? There is no doubt poultry will pay if it is attended to, like any other business. The cause of much disappointment is that people wish to treat it as a hobby, as a mere fancy, and yet expect to find it profitable. In every pursuit we know, success is the reward of much and serious painstaking. As you cannot expect to get 130 eggs from every hen, you must make up the sum by selling young fowls for the table. This will enable you to sell the surplus stock of cock chickens. You must also keep a good supply of pullets for winter layers; their eggs will often make 2s. each. We do not believe you can make your poultry a certain income to be calculated like a sum in addition. With painstaking you can nevertheless make it pay, and if you will give us more detail of your appliances we will give you more advice.

BROMLEY POULTRY SHOW.—We have received from "THE TREASURER OF THE BROMLEY SHOW" a letter in reply to "REPORTER," but the defence amounts to no more than is contained in these two sentences—the errors were "for want of time and assistance," and that the mistake about free carriage was the Secretary's. We at once say that these are no excuses, for if any one undertakes to manage a poultry show, he thereby undertakes that it shall be well managed. We never heard of a show worse conducted than that at Bromley—thrift and mis-statements marked it; and as we are writing we have received the following:—"Having won a prize at the late Bromley Poultry Show, I was somewhat surprised at receiving the amount less one shilling, which was charged for the prize card! As a frequent winner at many of our greatest shows, I ask if this is not 'something new?' I will gladly sell the elaborate card to any of our correspondents, as I would rather possess the shilling, and I believe other exhibitors will agree with me. —A WINNER AT THE BROMLEY SHOW." Such proceedings must prevent exhibitors sending birds to any future show at Bromley.

OBJECTING TO JUDGES.—You have struck the right key to open the door for the reformation of a lot of abuse, and though I am not an exhibitor, I am aware of a circumstance where a judge has been treated in the manner

described by "RESPICE AD FINEM," and which cannot be too strongly denounced.—C. B.

DORKING COCK'S COMB FALLEN (Richmond).—The falling comb is a disadvantage to a Dorking cock, but improved condition will sometimes cause it to become upright, except just at the back where it turns. If competition were close the defect would turn the scale against him.

FEEDING BEES (A Monmouthshire Lady Bee-keeper).—In this month's Bee-keeper's Calendar (p. 135) most of your questions have been anticipated. About half a pound of sugar mixed with an equal weight of water, given to each of your hives, will stimulate your bees to breed and keep up the hum of prosperity. Clean the floorboards at once. Widen the entrances at the end of March. You may remove your hives a few feet at any time with safety, and change the covers too, as you intend to do. The loss of so many stocks of bees in your neighbourhood and elsewhere is wholly owing to the ignorance and inattention of their owners. A few pounds of sugar and a little attention would have saved them.

BLEACHING GRASSES (E. H. E.).—Dissolve 2 ozs. of chloride of lime (bleaching powder), in three pints of water, put the grass into the solution, and let it remain in it for an hour; then take it out and rinse it in two or three changes of clean cold water.

### REMARKS.

18th.—White frost; a beautiful winter's day; bright, dry, and cold.

19th.—Another white frost, and again followed by a very fine day.

20th.—Very foggy morning; occasional bursts of sun about noon; thick in afternoon, though a fine evening.

21st.—White frost again; fine till 2 P.M., then less bright, and rain in the evening.

22nd.—Dull though fair all day; slight shower in the evening.

23rd.—Dull, damp, and dark all day, sometimes rain; only one or two gleams of sun.

24th.—Dull morning, rather better in afternoon, and fine night.

Temperature variable, and about 3° below last week except underground and in sun. Barometer high and very little rain.—G. J. SIMONS.

### COVENT GARDEN MARKET.—FEBRUARY 25.

THE present moderate and open weather enables us to obtain a good supply of continental goods, which comprise Lettuce, Endive, Radishes, Artichokes, and Asparagus; the latter, however, maintains a high price. Of fruit there is nothing worth attention beyond the ordinary descriptions, excepting some Easter Beurre Pears. Hothouse Grapes and Pines are quite sufficient for the trade. A large arrival of the latter from St. Michael's took place on Saturday. Good sound samples of Potatoes are in good request, the bulk of inferior very heavy.

From observations taken near London during forty-three years, the average day temperature of the week is 49.1°; and its night temperature 31.8°. The greatest heat was 67°, on the 10th, 1826; and the lowest cold 7° on the 10th, 1847. The greatest fall of rain was 0.69 inch.

## NOTES FROM MY GARDEN, 1873.—No. 4.

## MY GREENHOUSE, AND WHAT I DID WITH IT.

**F**IRST let me describe it; for as I have studied economy of space and construction, what I have done may be found useful to others similarly situated. It is a span-roofed structure, 20 feet long, 12 feet wide, and 11 high; the bars of the roof are fixtures, and there is an opening in the middle of it for ventilation; the sides, down to the brickwork, have their sashes each to open, and there is also a small sash at each end for the same purpose, so that in one great requisite of a greenhouse, ventilation, I am not deficient. For heating I have adopted the simplest plan I could find—the old-fashioned flue, with this exception, that the real flue is only about 6 feet in length, and the remainder, which is carried right round the house, is of drain-pipes 4½ inches in diameter. This I have found sufficient to exclude frost in the severest weather, and that is all that I want. It answers my purpose admirably. The furnace burns coke, cinders, coal—anything; and I have always felt that with a hot-water apparatus, however economical it might be, there was a great waste of power for a small house; moreover, unless it is used continually, there is great danger of its rusting and getting out of order. The inside of the house is arranged with a broad stage on each side, and a walk up the centre; in both of these I have studied utility, and I think, also, the appearance of the house is good. The stage stands 4 feet from the ground, and the walk, which is also made of battens, about 1 foot; underneath this latter I can stow away out of sight either pots or roots, such as *Tropæolums*, *Nerines*, *Lachenalias*, &c., which have gone to rest; while under the stage I can place anything that I may wish temporarily to have under cover. Attached to the house, but on a lower level, is another, about 12 feet long, a lean-to, in which I have a couple of Black Hamburg Vines, and which I am enabled to utilise in other ways. I should have said that I have over the walk in the upper house a hanging shelf running the whole length of the house, and two smaller ones at the end, all about 9 inches wide.

Having thus described the house, let me say something of its inmates. One stage I give up to hardwooded, the other to softwooded plants. It is the month of October, and the house is made snug for the winter. On the hardwooded side I have about three dozen plants of *Camellias*, the same of *Azaleas* of various sizes, and about half a dozen other plants, such as *Genetyllis*, *Acacia*, *Pimelea*, &c.; on the other side I have about four or five dozen of *Show Pelargoniums*—thanks to Mr. Charles Turner, these always being the new ones of the last and present season—these are for the present in small pots in order to economise space; then there are about a dozen *Roses* in pots, three or four *Tropæolums*, a dozen *Cyclamens*, some *Lachenalias*, a few *Primulas*, and some small *Zonal Geraniums* to give me a few winter blooms for specimen glasses. Then, on the upper shelf, I have in store pots

the few *Zonals* that I use for putting out in the garden in the summer; for, as I have previously said, I do nothing in the bedding-out line, and these are sufficient for my small wants.

It will thus be seen that my house is tolerably full; it remains thus until early in February. By that time some of the *Camellias* have bloomed, and are removed into the lower house; this gives more room to the *Azaleas*. On the other side *Lachenalia pendula* is out of bloom, and the *Pelargoniums* are potted into larger pots, and given more space; the *Roses* are beginning to show their blooms, and the *Cyclamens* are in full blossom, while a few *Hyacinths* add both colour and perfume to the house. The month of March sees another change—the *Camellias* have gone into the lower house, the *Lachenalias* gone out of bloom, the *Roses* mostly over, and the space is given to *Geraniums* on the one side, and the *Azaleas* on the other; the store pots of *Scarlet Geraniums* are removed to the lower house, and if I can do so, they are potted-off singly, and placed in a cool frame, and the whole length of the upper shelf holds about eighty plants of *Strawberries*; they can hardly be called forced fruit, but I have, at least three or four weeks before I have any out of doors, some nice dishes of fine and clean fruit. Last season my fruit of Dr. Hogg were grand.

The last change in the house is when these have fruited, early in June; then the *Camellias* and most of the *Azaleas* have gone into the lower house, where I leave them to grow under the shade of the Vines, the shelf is removed, and the entire space given to the *Show Pelargoniums*, which by this time have been tied-out, and admirably occupy the place given to them. I do not mean to say that they are symmetrical plants, but they are not leggy, and they give me a copious bloom. As the spring advances I place inside the glass some of Collinge's shading, which I find quite enough, and yet so thin that it does not require to be taken down until the need for it is past. After the *Geraniums* are over I consider the house free until the autumn again, and I think that it may be fairly considered to have done its duty. And this was what I did with my greenhouse in 1873: the lower house is used to hold a number of *Chrysanthemums* in pots, where they bloom freely and well up to the end of December.—D., Deal.

FRUITING THE *FICUS ELASTICA*.

*FICUS ELASTICA* is a general favourite with all who, like myself, grow a number of plants for decorative purposes. I think many will agree with me in saying that amongst all our valuable plants there is not one more suitable, taking all its merits into consideration, and the extreme low temperature in which it may be grown. As a decorative plant, where is there one which will bear the variable degrees of temperatures as this one? Throughout my twenty years' experience I heard not of its being bloomed and fruited until last year.

In February, 1871, I inserted my cuttings in a common Cucumber-frame without pots. They rooted well, and made a good start in March. They were potted in 60-sized

pots, placed in the stove until July, and afterwards potted in 48-sized pots. I then placed them in the greenhouse. As they became stronger they were frequently placed in vases, kept in the drawing-room for a week or ten days without water, and afterwards returned to the greenhouse. This treatment they endured frequently, until they became too leggy for that purpose. In February, 1872, I potted them in 36-sized pots to grow them on for conservatory purposes, and there they remained throughout the summer and autumn months up to December, frequently throwing roots over the top and underneath the pots, but these roots were cut off. It may be well for me to state that our conservatory was not heated the same autumn, the thermometer often reaching 34°.

In January, 1873, the heads were taken for cuttings, and the old plants removed to the early vinery for a short time. When they had started into growth I noticed at the axil of each leaf something making its appearance as if for producing more shoots, but found that it was bloom. This was in June, but to my disappointment, like the Fig, it bloomed inwardly. I still waited, anxiously looking forward to the ripening period. I could not see any alteration in the fruit until September, when it commenced to change colour. When fully ripe it was of a very dark brown with light spots. The fruit increased about three-quarters of an inch in length. Soon afterwards I was tempted to taste it; it was quite sweet, agreeable, and full of seeds.

The compost which I find suits it best is one-third light loam, one-third peat, adding leaf mould, cow dung, charcoal, silver sand, and a small portion of soot in equal proportions. —H. A. MANN, *Brampton Park*.

#### CULTURE OF WINTER BROCCOLI FAR NORTH.

In the *Journal* of February 19th I see an article on Winter Broccoli by your correspondent Mr. Taylor, in which he complains of the difficulty of getting it of a true strain, and I can fully endorse what he says on that head from experience. Winter Broccoli, in the north of Scotland, from where I write, is often a very uncertain crop under favourable circumstances, and of course much more so when seeds of mixed or inferior quality are supplied. In several places of note as vegetable-growing establishments which I have seen, the quarters selected for winter Broccoli were generally the most favourable which could be had as regarded exposure to the sun, and on being appointed to a master's place, I, of course, followed the same plan with varying success, until a few years ago a circumstance occurred which made me alter my system as far as situation is concerned. Having received a packet of a variety known as Carter's Champion, I had it planted along with the others in a favourable position, as I supposed, sloping to the sun, and in the autumn it looked all that could be wished in a Broccoli to stand the winter and do good service. The winter being a rather mild one all went well till about the middle of January, when I looked through my Champions, expecting them to turn in next month; but mischances will occur between the garden and the kitchen, so it proved in my case.

The first fortnight in February we had hard frosts every night, with bright sunshine by day, during which my Broccoli almost succumbed or was rendered useless; but fortunately a few lines of the same variety were planted in another quarter, where they were shaded in the early part of the day by some trees at 20 yards from them, so that they were partially thawed before the sun got at them. They came in during March, and very good heads they were; so from that time we have always endeavoured to have room for winter Broccoli in such a position as not to have the sun till partially thawed, and have succeeded well since.

It must be noted that ours is a rather light soil, and perhaps the above practice would not suit on clay soils. I know it is the practice in some places to lift and store the Broccoli in sand, and other means of protection afforded; but for one place with convenience for that, there are twenty where such cannot be attempted.

Another great mistake with Broccoli to stand the winter is overcrowding, the consequence of which is that after a few nights of severe frost, followed by sunshine, down go the leaves never to rise more; with the exception of a few near the crown there is little to be expected from such plants. We give 3 feet by 2½, and try to have the ground well trenched and manured, and by such means get stout robust plants fit to face all weathers. The selection of proper varieties, and not too many of them, is

of great importance for winter crops. In summer one can make many shifts, but not in winter.

Your able correspondent, "OLD FRIEND," has pictured but what is really the experience of many a gardener if willing to confess it. Now, in the case of Broccoli, every year brings out new varieties with high-sounding qualities recommending them to the notice of the public; they may or may not be what they are given out for, but as ("Burnt bairns dread the fire"), I always make a point of not dismissing the old tried sorts for the stranger, but rather plant an extra line before trusting him further till assured of his friendship by proof.

There is one introduction of late years which is a great acquisition to us in the north, whatever it may be in the south—that is, Veitch's Autumn Giant Cauliflower. The past two seasons we have cut it in fine condition from September to January, and I do not know how much longer we might have done so had more been planted, and such heads as to put the autumn Broccoli into the shade; it is the only addition of importance we have made to our old varieties, which in ordinary seasons give us a pretty constant supply. We have, first, Snow's Winter White, which succeeds the Cauliflowers; then Granger's Spring White, followed by Wilcove White, a really good sort which carries us well on to the Cauliflower season again. Now, there may be many other varieties of equal merit to these, but as they give us a full supply I am perfectly satisfied with them.

I believe much of success with Broccoli depends on not letting the plants remain too long in the seed bed before pricking them out, and finally planting them before they are too large and drawn-up, for once in that condition they may as well be thrown away. With plenty of room when planted out, and the soil well worked and kept constantly stirred with the hoe, and only such sorts as are to be depended on planted, no one on moderately light soil need despair of having winter Broccoli. But as a great many readers of the *Journal* have clay soils, an article on the management on such would no doubt be very acceptable. —J. S., *Aberdeen*.

#### ERANTHIS HYEMALIS, OR WINTER ACONITE.

This cheerful-looking plant, with its bright yellow flowers, is not half so often met with as it ought to be, for, like many other favourites of former days, it is utterly neglected by the fashionable flower gardener, who, in limiting his display to a certain period, has totally ignored the remainder of the season. and at least the first two and the last two months in the year have no place in his calendar. The plant is of neat growth, and produces rich-coloured blooms, equalling in that respect the best forms of the bedding *Calceolaria*; and although it blooms very often in January, and more abundantly in February, at a time when flowers of all kinds are scarce, its importance seems not to be duly appreciated, probably owing to some idea of its being difficult to manage, and also, perhaps, from its not being sufficiently known. Be this as it may, a plant with bright shining foliage of a clear unspotted green, with flowers larger than the Primrose, supported on stalks not more than 3 or 4 inches high, and appearing almost in mid-winter, ought not to be lost sight of. It is by no means plentiful; possibly it was more so half a century ago, and the places where it is most likely to be found in quantities are some of the old-fashioned gardens which it is a treat now and then to meet with.

Perhaps one of the causes of this plant's not being more frequently met with in fashionable winter or spring bedding is the fact that it does not transplant so well as many others, and the best examples of it are seen where it has been let alone for two or three years; then it rushes up in luxuriance every Christmas, and blooms at the proper time. The best examples of it at this place are planted as edgings to Rose beds, and also as edgings or rings round single trees or shrubs, where it is not disturbed the whole year round. In such places it ripens seed, sows itself, and often comes up amongst the turf, or it may be on the gravel walk, and it also increases itself at the root, but not very rapidly; so that in most cases where an edging of it is wanted I would recommend sowing the seed as soon as it is gathered, and that care should be taken that it is not disturbed till the ensuing spring, when it comes up thickly enough. Excepting transplanting in order to fill-up defective places, I would leave the plants in the seed row, unless they are very close together, in which case thinning may be necessary.

Usually this plant thrives in a dry open soil, but our experience with it shows that it also succeeds well in one of a

somewhat chalky character, as we have seen it in such a position struggling successfully to maintain itself amongst the grass and other herbage under trees. If grown in the mixed flower border a stout stick or other low mark should indicate where it is, as during a great portion of the year the bulbs are dormant and there is no foliage. The edges of rockwork also afford a favourable position, likewise the margins of shrubberies, and similar places. Early in February, when it shows itself along with the Snowdrop and Primrose, no plant is more generally welcomed; and whether growing at the base of a palatial residence, or as a patch by the pathway to a rural cottage, it is equally at home.

Although I have advised sowing the seed where the plant is wanted, the Winter Aconite bears transplanting tolerably well when it has just started to grow, and in such a condition it may be removed without much injury from the seed bed; and as this is often more convenient than the other modes of obtaining a quantity, I may remark that it answers very well. In some soils that suit the plant it is extremely accommodating, and I have seen it overcome grass and other herbage that usurped its place in the autumn; therefore those anxious to have it in abundance need not be apprehensive of its want of constitutional vigour, provided the soil is of the right kind. Its greatest enemies are the spade or digging-fork, and in some cases the scythe; in other respects the Winter Aconite is better able to take care of itself than many other plants, and, as I have already remarked, few are more worthy of notice, coming into bloom amongst the very earliest of the early flowers, and presenting us with the same glittering tint of yellow which renders the Crocus so acceptable, while it is some weeks before it, and altogether of a different character.—J. ROXBOROUGH.

## ROYAL HORTICULTURAL SOCIETY.

MARCH 4TH.

**FRUIT COMMITTEE.**—A. Smee, Esq., F.R.S., in the chair. Apple Annie Elizabeth, a kitchen variety which was certificated by the Committee in 1868, was sent by Messrs. Harrison & Sons, Leicester. The fruit were in good condition, juicy, and solid. The same firm also sent fruits of Duke of Rutland Apple taken from the seedling tree, but they had been badly kept, and were of inferior quality. Pots of Dwarf Kidney Beans were sent by Mr. W. Rapley, gardener to R. Hudson, Esq., Clapham Common.

**FLORAL COMMITTEE.**—Mr. J. Fraser in the chair. Messrs. J. Veitch & Sons, Royal Exotic Nursery, Chelsea, sent fifty-three pots of Roses, comprising the best of the Hybrid Perpetuals and Teas. The flowers were not quite so large as they are at the later exhibitions, but the foliage was very beautiful, and the blooms quite as brilliant in colour as they are to be had at any season. Amongst the crimson shades the best was *Mlle. Marie Radv*, followed by such sorts as *Sir Richard Wallace*, *Duchesse de Caylus*, *Madame Victor Verdier*, and *Fisher Holmes*. Of rose shades *Lyonnaisse*, *Elie Morel*, *Madame Marie Girod*, *Mons. Nonan*, *Paul Néron*, and *Anna Alexieff* were the most noteworthy; and *Bessie Johnson*, a beautiful blush. Teas consisted of *Coquette de Lyon*, *Madame Falcor*, *Marcelin Roda*, and *Madame Willermoz*; the first two are fine button-hole flowers. The same firm sent a collection of well-grown plants of early-flowering Clematis, nice healthy plants furnished with a score of flowers on each. *Lucy Lemoine*, an exceedingly fine variety of the *Fortunei* type, with pure white double flowers, had a first-class certificate. Orchids and *Amaryllis* were sent by the same firm. *Dendrobium thyrsiflorum* was very beautiful. What a pity it is that the flowers are of a fugacious character. *Vanda suavis*, one of the best of the *Vandas*, was also shown, likewise a handsome plant of *Dendrobium glumaceum*. The following, sent by Messrs. Veitch, also obtained first-class certificates. *Rhododendron* *Duchess of Edinburgh*, a garden hybrid resembling *R. Lebbii* in the colour of the flowers, which are a glowing vermilion scarlet—the small seedling plant which was exhibited shows it to be very floriferous; *Rhododendron* *Early Gem*, a very useful early-flowering variety, of which a basket was sent lifted from the open ground—it has a profusion of bright lilac-coloured flowers. In addition baskets of *Ligustrum japonicum* and *L. japonicum lucidum*, broad-leaved Privets, were sent by Messrs. Veitch.

Mr. Bull, of Chelsea, sent *Encholirion cerallina*, with pale yellow flowers and red bracts; a cut specimen of *Medinilla amabilis*, with lilac peach-coloured thyrses; and *Cymbidium Mastersii* noticed in previous reports.

Mr. Denning, gardener to Lord Londeshorough, Norbiton, sent *Epidendrum imperator*, with brilliant cinnabar flowers, with a paler column and rose lip. This was awarded a first-class certificate.

A box of the charming early spring-flowering *Iris reticulata* came from Messrs. Barr & Sugden, of Covent Garden. This plant should be in every garden, as it flowers out of doors, with

the Crocus. But its delicious fragrance is most fully developed, and the intense purple colour shows up to the best advantage, when the sun streams upon the plants through a glass screen.

Mr. Barker, nurseryman, Littlehampton, Sussex, sent a seedling *Imantophyllum* named *Barkeri* with striped leaves, good both as a flowering and ornamental-foliaged plant, though the flowers of the specimen exhibited were not so large as in *I. minimum*, of which it appears to be merely a variegated form. From Messrs. Standish & Co., Royal Nurseries, Ascot, came a group of *Hyacinths*, *Cinerarias*, *Spirea japonica*, *Clematises*, and double-flowered *Zonal Pelargoniums*; and from Messrs. E. G. Henderson & Son, Wellington Nursery, St. John's Wood, a group of seedling *Cyclamens*, and one of *Seldanella alpina*.

## NOTES AND GLEANINGS.

THE TRIALS OF FLOWERS AT CHISWICK this season are the following:—New *Pelargoniums*, for bedding purposes; *Pelargoniums* of the pink and rose-coloured sections, as pot plants; *Fuchsias*, as pot plants, grown to larger size than heretofore; *Pentstemons*, of which some very fine sorts bloomed late last year; and flowering *Begonias* of the *boliviensis* strain, now becoming so numerous. A collection of bedding *Violas* and *Pansies* is also being got together. Those who possess novelties which they desire to have tested, as well as those who are willing to render aid in making up the collections of these flowers for the general information of the floral world, are invited to send their plants to Mr. Barron, the Gardener-in-Chief, at Chiswick, as soon as they conveniently can. It may be mentioned, as an inducement to raisers of novelties to send their own productions direct to Chiswick, that it has recently been decided, on the recommendation of the Board of Directors, to issue certificate cards in the case of all subjects certificated at the gardens, and which will of necessity be made out in the name of the donors. This has not hitherto been done, as the announcement has been reserved for the report; but from the frequent delays which occur in the issue of the latter, it has been thought desirable to issue the certificates immediately after each of the Chiswick meetings.

MRS. MARY TREAT publishes in the "American Naturalist" for December, 1873, a remarkable contribution to our knowledge of the sensitiveness of the leaves of the Sundew, her experiments being chiefly made on the large American species *Drosera filiformis*, the leaves of which capture and kill moths and butterflies 2 inches across. Her observations are in accordance with those already recorded on English species, that the motion of the glands is excited only by organic substances, or if for a very short time by mineral substances, that the excitement passes off almost immediately. The most astonishing of her observations is, however, that when living flies are pinned at a distance of half an inch from the apex of the leaf, the leaf actually bends towards the insect until the glands reach it and suck its juices. In the "Naturalist" for January is an account of Roth's observations on the irritability of the Sundew, made nearly a century ago.—(Nature.)

## KEEPING GRAPES IN WINTER.

1. Thin the bunches more severely than if not intended for keeping.
2. Give them, especially when ripening, plenty of light, and a circulation of dry warm air.
3. Complete the ripening, if practicable, by the first week in October at the latest.
4. Allow no stagnant water about the roots of the Vines.
5. Keep all inside surfaces dry after the 1st of October.
6. Avoid a low stagnant temperature; keep inside of house steadily above the external temperature.
7. Keep the house close during foggy damp weather. Keep the temperature at about 45°, with just a chink of air at top, and this, if possible, so as not to allow the damp to enter.
8. Remove all faulty berries, cut-off all laterals, and, if necessary, remove a part of the foliage.

*Results.*—Out of three hundred bunches kept in a low sunk pit under the above conditions, not 2 lbs. were lost by decay.—(The Gardener.)

## DIG-UP THE POTATO BEFORE RIPE.

THE remedy which is recommended by Mr. Luckhurst is certainly the best and most practicable for avoiding the disease. As an amateur I have practised it for ten years, and can, therefore, fully corroborate all he says. I have grown Fox's Seedling, Dalmahoy, Fluke, Paterson's Victoria, Lapstone, Early

Betty, Sutton's Red-skinned Flourball, and other sorts, and have not by disease lost as many galls as I have practised the method referred to years.

"D., Deal," asks in your number for February 19th, Are the Potatoes to be dug before the skins are set? I have done so for years with the above result. Last year I planted from the 22nd to the 29th of March, and dug my crop and housed it from the 16th to the 31st of July. I dig them on a sunny day, and let them lie open to the sun until evening, when they are carried in-doors, and kept in boxes.—C. B., *Godalming*.

### VELTHEIMIA VIRIDIFOLIA CULTURE.

This is an old-fashioned bulbous plant which has been introduced from the Cape of Good Hope more than a hundred years. It is of easy culture, thriving well in any good light sandy soil. The flowers somewhat resemble those of the Tritoma, and continue a long time in perfection. Single buds in small pots will flower during the winter months freely, and they produce a very pleasing variety among gay-flowering plants. We prefer growing three or four bulbs in what are termed 32-pots. After the flowering season is over gradually withhold water, but take care never to allow them to become dust-dry.

This species is quite hardy, and may be placed out of doors all summer behind a north wall. About August place them in a frame, and give them plenty of air and water. Before frost sets in remove to a shelf in the greenhouse till the flowers appear, when they may be placed among other flowering plants. If kept free from damp the flowers will continue in perfection for three months, or even longer, and they have a very pretty effect among other inmates of the greenhouse in the dull winter months.

It can be readily increased by offsets from the bulbs, which may be potted-off and grown-on until they become strong, when they will produce flowers. This is a very interesting plant, and requires little care or attention.—J. SMITH, *Exton Park, Rutland*.

### ROYAL HORTICULTURAL SOCIETY'S COUNTRY MEETINGS.

WE have received the following from Messrs. Veitch and Sons:—

"You last week published a letter from the Secretary of the Royal Horticultural Society to us with reference to the non-holding of a provincial exhibition this year. We shall feel obliged by your publishing this week the enclosed, which is our reply to the Secretary's letter."

"Royal Exotic Nursery, King's Road, Chelsea, S.W.  
February 28th, 1874.

"W. A. Lindsay, Esq., Secretary, Royal Horticultural Society.

"Dear Sir,—We beg to acknowledge your letter of the 25th inst., to which pressure of business has prevented our sooner replying.

"We must express our very great surprise that it is only at so recent a date that the Council acknowledged that they have been unable to come to any satisfactory arrangement with regard to a provincial show being held this year, that acknowledgment being obtained only in consequence of the protest sent to them by exhibitors who acted on a rumour which had reached them; and we think it is not complimentary to exhibitors as a body, or treating them with the courtesy they are fairly entitled to, to ask them only at the last moment, as it were, to help the Council by 'proposals and suggestions' out of what appears to us to be a very great misfortune for the Society.

"Had the Council really wished to have the opinions and suggestions of exhibitors, we submit that it would have been much better to have solicited them last autumn at some of the meetings held for regulating the prize list for this year.

"When the Annual Report was issued by the Council a short time since, we noticed that the Provincial Show at Bath last summer was specially alluded to as a 'horticultural and financial success,' also that 'very material alterations were proposed in the arrangement of future provincial shows, with the object of increasing their scientific value and social comfort.'

"We think, therefore, from the Council's own statement there is every cause to regret their inability to arrange for such an exhibition, and under the circumstances of the case we fail to see why the last portion of the paragraph quoted was thought necessary, when they must have known that no exhibition was likely to be held this year. We must also add, that as you say in your letter to us, 'the Council are most anxious to promote and encourage these shows,' it seems to us extraordinary that they are unable to carry out arrangements which were so successfully managed by the late Council during the last six years.

"In conclusion we wish to say that we are only now stating our own views, having had no opportunity of conferring with those gentlemen who signed the protest with ourselves.

"We are, dear sir, yours faithfully,  
"JAMES VEITCH & SONS."

WOULD you let me correct a printer's error in the letter that you were good enough to print last week? I spoke of gardeners as "these more working bees;" the change of a letter has made it *mere* working bees. No one who reads the articles

in your Journal by gardener contributors or Mr. Fish's speeches would call first-class gardeners mere working bees.

I see the question of a country show is being revived. As I read the printed accounts, they seem to show that not only all the old country show fund, but the surplus from the show at Bath last year, have been spent by the acting Council for the general (that is, mainly Kensingtonian) purposes of the Society. But still it seems a vast pity that such a temporary misappropriation of the surplus should lead to a break in country shows which have really helped horticultural progress.—GEORGE F. WILSON, *Heatherbank, Weybridge Heath*.

### FLOWERS FOR OUR BORDERS.—No. 27.

TRITONIA AUREA.—GOLDEN-FLOWERED TRITONIA.

THIS fine Caffrarian Irid when vigorously grown, and with healthy foliage, is, undoubtedly, one of the handsomest species not only of its genus, but even of the natural order to which it belongs. Unfortunately, its thin membranous foliage not seldom becomes in a dry atmosphere a prey to that pest of the

*Tritonia aurea*.

gardener, red spider, and its vitality being thus weakened, the development of the flower-spike is checked, and the plant is shorn of much of its beauty. With ordinary care, however, and the occasional use of Gishurst compound or Fowler's insecticide, followed by the syringe, it is by no means difficult to preserve the foliage in a healthy state, and the plant will well repay the amateur for these slight attentions.

Strong corns will produce stems from 2½ to 3 feet high, with a branched spike bearing numerous flowers of a rich apricot colour, each 2 inches across.

It is found to succeed best in a mixture of equal parts of heath soil, loam, and leaf mould, with a small portion of sharp white sand; in short, in the same compost in which the *Gladiolus*, *Ixia*, and most of the plants usually classed as Cape bulbs are known to flourish. The corns should be potted about October, in well-drained pots filled with the above compost, and placed in a cold frame, with just sufficient protection to ward-off severe frost; and during the midwinter months it should be kept nearly dry. Where there is not the convenience of a cold frame the pot might be safely placed in the window of a cool room; and in either situation it may be retained till May, when it should be stationed out-doors, in a partially shaded border, upon ashes, to exclude the worms. As soon as the flower scape appears the plant may be removed

to the window, or a cool greenhouse, where the development of the blossoms will proceed more favourably than when fully exposed. In the southern counties, in favourable localities and in suitable soils, it may be planted out after danger of frost is over; but the corns should be reotted in autumn, as it is incapable of resisting severe frost.

*Tritonia aurea* may be increased by seed, which is produced by the strongest flower scapes, if the plants are continued in growth after flowering; and the seed should be sown as soon as gathered, the young plants being carefully preserved from frost the following winter. It is worthy of remark in connection with the growth of this plant, that the new corn annually produced is found at a distance varying from one to several inches from that of the previous year, with which it is connected by a stout fibre. Whether the older corns perform any useful function is uncertain, but they never flower but once, though often remaining undecayed for years. As the bulbs of some species of *Tritonia* may be preserved in a dry state for weeks, it is necessary to point out that in the case of *T. aurea* the drying-off process must not be attempted. When the foliage withers water may be partially withheld, but the soil must on no account be permitted to become quite dry.

The blossoms of this plant when dried, and afterwards moistened with warm water, give out a strong odour of saffron, which circumstance has induced Dr. Planchon to constitute it a new genus under the name of *Crocisma*, by which it sometimes occurs in catalogues.—(*W. Thompson's English Flower Garden, Revised by the Author.*)

### A NEW ENEMY OF THE POTATO.

I wish to say a few words about an enemy which threatens to lay waste one of Europe's most valued esculents, the Potato. For a long time North America has had to contend against two foes, which devoured the early shoots and leaves of the Potato, and thus destroyed the hopes of the farmer and gardener. These were beetles belonging to the same family as the Blister-fly, and named *Lytta atrata* (or *vittata*) and *Cantharis vivaria*. They can be kept within bounds; but of late a third beetle has appeared among us, which really threatens to drive the Potato out of cultivation altogether. It bears the name of the Colorado Potato-beetle (*Doryphora decem-punctata*); and should it once reach the Atlantic coast, and be carried unobserved across the ocean, then—woe to the Potato-grower of the old country!

A man must witness the myriad legions of this insect, and the ravages of its never-tiring larvæ, in order to form an idea of the terrible danger with which Europe is threatened. For myself, judging from the tenacity of life exhibited both in its larval and perfect condition, I have not a doubt that it will soon overstep the bounds of North America, and make a home for itself in other lands.

Its true domicile is in the Rocky Mountains, where it feeds on a species of wild Potato, *Solanum rostratum* (or *carolinianum*). No sooner, however, had the edible Potato (*Solanum tuberosum*) been planted by settlers at the foot of these mountains, than *Doryphora* attacked it greedily; the more largely its cultivation extended westward, the faster did its insect foe travel in an easterly direction, and scatter itself over the land. In the year 1859 it was located one hundred miles west of Omaha city, in Nebraska; in 1861 it showed itself in Iowa; in 1865, not only had it begun to devastate Missouri, but it had crossed the Mississippi in Illinois, everywhere leaving behind it flourishing colonies. In 1868 Indiana was visited; in 1870 Ohio and the confines of Canada were reached, also portions of Pennsylvania and New York; and its entrance into Massachusetts was notified. During the year 1871 a great army of these beetles covered the river Detroit in Michigan, crossed Lake Erie on floating leaves and similar convenient rafts, and in a very short time took possession of the country between St. Clair and Niagara rivers. Having got thus far, in spite of all efforts to stay their progress, there is every reason to believe that before long we shall hear of them as swarming in the streets of New York and Boston (as they already swarm in the city of St. Louis), and then their passage across the Atlantic is a mere matter of time. Moreover, the beetle in its different stages is so entirely unaffected by the extremes of heat and cold, of wet and dry, which it has met with here, that I have no doubt it will care as little for the changes of climate which occur in the temperate zone of Europe, and, once settled, will quickly become naturalised.

The devastations of the Colorado beetle are all the greater

from the fact of its propagating itself with extraordinary rapidity, several broods following each other in the course of the year. The first batch of infant larvæ appears towards the end of May, or, if the weather be mild, of April. In fact, scarcely has the Potato plant shown itself above the ground, before the insect, which has been hibernating during the winter, also wakes to life. The female loses no time in depositing from seven hundred to twelve hundred eggs, in clusters of twelve or thirteen, on the under side of a leaf. Within five or six days, according to the state of the weather, the larvæ escape from the egg and begin their work of devastation, which goes on for some seventeen days, when the little creatures retire below the soil, in order to undergo the pupal condition. After a delay of ten or fourteen days the perfect insect comes into being, and the business of egg-laying commences anew. In this way, according to recent observations, three broods follow each other; the last, as just stated, wintering below the surface of the ground. No description can do justice to the marvellous voracity of this insect, especially in its larval state. When once a field of Potatoes has been attacked all hope of a harvest must be given up; in a very few days it is changed into an arid waste—a mere mass of dried-up stalks.

Fig. 1.—Colorado Potato beetle in different stages, from egg to perfect insect.

At one time the cultivator indulged in the vain hope that *Doryphora* was a mere passer-by, that he would do his worst and then move on, without becoming a permanent nuisance. Others, again, fancied that a hot summer and autumn, followed by a long drought in the ensuing year, tended to diminish its numbers. But it has been proved incontestably that the diminution was only due to the circumstance of many of the larvæ perishing, through being unable to enter the ground hardened and baked by the great heat; plenty were left to continue the breed.

Of the many nostrums that have been employed for the destruction of this beetle, one only has shown itself to be of any value. I mean, dusting the plants with the highly poisonous substance Paris green—a compound of arsenic and oxide of copper. However, setting aside the dangers of inhaling this deadly mixture while spreading it over the fields, there is the additional peril of impregnating the soil with it—a peril which experiments carried out at Washington have shown to be well founded. There remains, therefore, only the plan of hand-picking, day after day, the eggs, larvæ, and beetle; but even

Fig. 2.—a, Colorado beetle. b, Foot of ditto. c, Pupa of ditto. d, Winged insect, enlarged.

this operation requires considerable care, for the juice of the crushed insect and its larvæ produces bladders and blisters

wherever it comes in contact with the skin. If a wounded spot be touched by it, severe inflammation ensues, which is liable to pass into ulcers, and an application of it to the eye endangers vision to a very serious extent.

Fig. 1 gives an idea of the Colorado Potato beetle in its different stages. The eggs are of a deep orange-yellow. The larvæ on first emerging are of a blackish hue, which passes quickly into a dark red, with a slight orange tint. On attaining their full size the colour varies between orange, reddish-yellow, and flesh. At c, fig. 2, is shown the pupa; at a the perfect insect, natural size; a foot is portrayed at b; a wing-case considerably enlarged at d. The ground colour of the latter is creamy-yellow (*rahm-gelb*), with five black longitudinal stripes, of which the third and fourth unite at the base.

*Doryphora* does not by any means confine itself to the Potato. In places where that esculent is wanting, it will support itself on any other member of the Solanaceous order—the Egg-plant (*S. Melongena*), the Tomato (*S. Lycopersicum*), or the Winter Cherry (*Physalis viscosa*). Indeed, in the northern parts of Illinois and in Wisconsin, incredible as it may appear, it has established itself in the Cabbage garden as readily as in the Potato field.—FR. H., *State of Illinois*.—(*Hardwicke's Science Gossip*.)

[Our attention to the above was enforced by the following note from a gardener's worthy companion:—

"My husband's eyes are not in a writing condition. He asks me to send you a paper (but doubts not that you have seen it) containing a notice of the Colorado Potato beetle. It has been sent to my husband by Mr. Beulah, an intelligent farmer and Journal admirer, who has for a long time been making inquiries, and says that his private information from the States warrants him in saying that the account is nothing overdrawn. My husband thinks if the pest find its way to England it will be in a pupa state with seed Potatoes, or that some enthusiastic naturalist will nurse some precious specimens, and get them over alive, and then expect a medal from the Entomological Society for his skill and perseverance."]

### A SUGGESTION.

A thought has struck me that the Royal Horticultural Society might do good service by offering prizes or certificates of merit for the best-managed gardens in the district in which it holds its provincial exhibition, thus taking a lesson from our cottage-garden societies. It does not take a very sharp eye to perceive the improvement that takes place in village gardens where merely nominal prizes are given: weeds disappear, crops grow more vigorously, and the men are better. I am aware that the difficulties would be greater in judging large gardens—it would be difficult to find judges in whom everyone could place confidence, but I believe competent and impartial men are to be found. The expenses would be great, but I think the benefit to be derived would be greater.

The provincial meetings of the Royal Horticultural Society are getting to have the character of annual gatherings of gardeners. We can always reckon on meeting some old friends and making a few new ones; and I must confess that I attend these meetings more for this purpose than for seeing the exhibition itself. We can also generally arrange to make our little holiday tour at the same time by visiting some of the places in the neighbourhood. But there is a difficulty—there are always more places within reach than one can find time and money to visit. All these places are reported in the horticultural papers to be wonderfully good, and it is true there is something good in each of them; but one cannot get at the comparative quality of them, and is always disappointed in all because some are better and some worse than expected. In a little tour I took at the time of the Exhibition at Manchester last September I had the pleasure of seeing what I believe was the best managed garden I ever saw, and I had hardly heard the name of it before, and certainly should not have thought of going there to look for good gardening had I not been directed by one who knew. If some scheme could be launched whereby we could have an authoritative comparison of some of the best gardens within reasonable distance of the exhibitions it would be a great assistance to those who, like myself, are anxious to pick up as much information as possible in the shortest time, while the man who should be fortunate enough to be marked out as the best gardener within twenty miles would have something to be proud of. We know we cannot be certain that a man is a good hand at his profession because he sometimes takes the first prize for Grapes or Cauliflowers.

Perhaps his principal attention has been given to those particular things he exhibits and others have been neglected, or they may be the only good specimens he has; but examine them where they are growing, and give prizes or certificates for the best house of fruit of any one kind, the best managed kitchen garden, or the best general gardening, and you at once stamp the recipients of these honours as something to admire and imitate.—WM. TAYLOR.

### ROSE PETALS.

I wish to say a few words in favour of Roses with large petals. Grace and beauty of form in our floral queen must go with large petals. The smaller-petalled Roses are to the eye of the artist often too confused and abrupt in their curves to be nearly so graceful as the larger ones. We must all admit that the most beautiful shape for a Rose is the deeply-cupped or half-globular form, as in Madame Rothschild, Pierre Notting, Maréchal Niel, &c. With this shape it is evident that much of the reverse or back of the petal is seen, and when in red Roses this is of a whitish tint or dull leaden purple, which is too often the case, the beauty of the form is seen to disadvantage, as colour attracts and fills the eye before it takes note of shape: therefore it is most desirable that brilliant-coloured Roses should be thorough, or the same on both sides; and it would be well in judging a new Rose to bear this in mind, as well as the importance of large well-curved petals.

The most perfect specimen of a large-petalled Rose I ever saw was a *Lælia*, nearly globular, measuring  $5\frac{1}{2}$  inches in diameter by nearly 4 inches deep. After this magnificent bloom had stood three days, and been twice exhibited, I measured some of its singularly large, thick, shelly petals, 4 inches in diameter, and like lovely pink saucers. The curved, arched, or shell-shape of the petals adds greatly to the endurance of the flower, and exhibitors have often proved that the best Roses to stand long journeys are those approaching the globular in form.—HENRY CURTIS, *Devon Rosery, Torquay*.

### JAPANESE GARDENS.

Shimonoseki, November 25th, 1873.

I ARRIVED here from Yamajuchi on the evening of the 22nd, having travelled overland. I found the Rice crop all secured, and the price has fallen to about 1½d. rio or 6s. per picul. The country is now beautiful in appearance, owing to the different colours of the leaves on the trees. On the hillsides the Japanese Wax tree (*Rhus succedanea*), which is extensively cultivated south of Kobé, and which grows to the size of an ordinary Apple tree, or the Chinese Tallow tree, has now turned the colour of its leaves from green to a deep blood-red, and as they ripen they fall off.

The country between Nagasaki and Kobé is, as I have before stated, noted for its excellent climate, and here flowers and shrubs grow to great perfection. At the present time you can hardly pass a single house without noticing the beautiful Chrysanthemums, some of the blooms fully 6 inches across them, and of every colour. As this is the royal flower it is cultivated to a great extent, and the flowers are taken to the large towns, where there is no room for small gardens, and sold to the merchants, &c. The Japanese gardener understands the art of cultivating the Chrysanthemum far better than we do in England, and there is much for our floral friends to learn in their cultivation. I can assure them that the wonderful size to which these flowers are brought would astonish them. I find that the Japanese are very careful in selecting the best soil they can procure, and only allow two or three blooms to come to perfection at the end of each shoot. Some of the flowers are remarkable, and most peculiar in form and colour, and I never saw any like them in England. We have white petals striped with red like a Carnation or Camellia, others looking like the fringe of a shawl.

When I was last at Nagasaki I visited several large nurseries at that place, and found several shrubs and plants of extraordinary size. What would some of our English florists say to having *Azaleas* 15 feet in circumference?—such was the case with one of which I took the measurement. The Japanese, as I have before informed you, have a neat way of cutting and training their shrubs. Some are perfectly flat at the top, reminding you of a dining-room table, and when in flower the *Azalea*, trained in this way, is a gorgeous sight. I also noticed several variegated plants, the names of which I have been unable to learn, except those which are very general, includ-

ing the *Farfugium grande*; also the *Sciadopitys verticillata*. Amongst the trees I observed a Fir which was very remarkable, and must have given its owner considerable trouble in training. It was about 20 feet high, but the branches were brought into the shapes of tables and chairs, which must have been a work of constant labour.

There is a Japanese gentleman connected with the custom-house here who is a great florist, and spends a fortune on his plants. On the morning after my return here I noticed a boatload of Camellias coming on shore from a steamer which had just arrived; and as you are aware I have always taken the greatest interest in all connected with horticultural matters, I went to examine them. This gentleman had just imported them from Hong Kong, and as he found I took an interest in flowers he invited me to see his gardens, and well did it repay me for the short walk. His house is situated on the hillside, overlooking the entire straits, and is protected from all the north-east and northerly winds by nature; and owing to the way in which he has laid out his grounds by planting Bamboo and other trees, he acquires artificial protection from other points. He has had a greenhouse built after the English plan, and there I found one of the finest collections of Ferns perhaps in the world. I counted sixty-nine different species, all looking the picture of health. If I could have only had Mr. Baines, of the Yorkshire Museum, along with me, or some other of my floral friends, I should have been enabled to have given your readers a far better description of these grounds than is now in my power. I will, nevertheless, attempt to describe them. However highly I may speak of them, I shall be unable to do them the justice they deserve.

Situated on the mountain side, the rear protecting them from north-east and east winds, stand a number of fine forest trees, which are common in this district. There is the *Abies firma*, *Pinus Massoniana*, *Cryptomeria japonica*, *Sciadopitys verticillata*, *Salisburia adiantifolia*, or Maiden-hair tree. There are about ten of the latter, all of which have attained a great size. As I have had to translate the names from Japanese I may have made errors—I hope your readers will excuse me. The Bamboo grows thickly amongst them. To the front, or south, the land and sea view is splendid, giving a prospect of the entire straits with the numerous mountains on the opposite side. His house is situated close to the trees, and there are three terraces, which must have been some considerable expense in their construction. These are laid out in all kinds of designs. The highest terrace, or No. 1 terrace, is adorned with miniature gardens, comprising shrubs such as the *Parasol Fir* (*Sciadopitys verticillata*) and Pines of other varieties; there are also a number of fish ponds, in which perhaps from twenty to a hundred gold fish are alive, swimming amongst the Lilies, which almost cover the entire surface of the water. On the second terrace *Azaleas* predominate; and I expect next spring I shall have a treat in again inspecting this garden, as each plant is different in colour. There are, amongst other shrubs I had pointed out, a species of *Eurya*, and a shrub, the name of which I have been unable to ascertain, but the description given by its owner is that it bears sweet-scented flowers in the first place, and now, as I see it, looks like our Holly, being covered with red berries. On the lower terrace there are more artificial gardens, and the *Camellia* here is the principal plant grown, though there is such a collection of variegated shrubs cut in the most beautiful shapes that I have ever seen, thus taking away the effect of the *Camellia* being too monotonous. On the border the *Chrysanthemum* in every shape and colour is now in full bloom, producing a very beautiful effect. On a future occasion I will give your readers an account of a visit to another garden in this neighbourhood.—JOHN TASKER FOSTER.

#### A WORD FOR CAST-IRON BOILERS.

Up to the present, stern winter has favoured our fuel bills considerably, but should the wind by chance, nautically speaking, chop round to the north-east now that nearly everything under glass is pushing into growth much heat will be required to prevent injury to young and tender plants, and would greatly affect this item of garden expenditure, although the season is so far advanced. Any information, therefore, how to avoid heavy fuel and new boiler bills is sure to be interesting to the many, and I for one feel much obliged to Messrs. E. G. Henderson & Son for their able letter, giving their experience with Messrs. Green & Son's wrought-iron boilers; but at the same time I regret they should have omitted to speak on the most important points—durability and the loss of heat in the

stokehole, which latter is inevitable with any apparatus not surrounded with brickwork or “insulated” to stay the radiation, and it is obvious that the heat escaping by this means cannot re-enter the piping for distribution where required. This necessarily involves a serious loss.

With self-setting boilers, generally speaking, the doors and frames are in dangerous proximity to the fire; these mostly become red hot even if the apparatus is but moderately pushed, and if composed of wrought iron will soon scale, and warp, and become defective. This, I am under the impression, is a serious objection to these kinds of boilers; but perhaps Messrs. E. G. Henderson will kindly enlighten us as to their probable lasting powers, as I understand from the conclusion of their letter that four by the same makers have been selected to replace others.

In carefully going through their letter I find with regret that the cast-iron tubular alluded to has not received that respect it is justly entitled to in this instance, and I need not say it is of the utmost importance when criticising any article of commerce that there should be no reserve or motive beyond benefiting the public at large; and further, if my memory does not fail me in dates and years, the fractured tubular served them considerably longer (doing its work cleverly to the same piping) than two of the wrought-iron now spoken of by them in such eulogistic terms.

In conclusion I should be glad to learn how much the two removed wrought-iron boilers were fractured less than the tubular, and why removed to give place to others composed partly of wrought and cast iron.—N. B.

#### TRIAL OF ONIONS AT SEAHAM HALL, DURHAM, 1873.

Name.	Ripe.	Keeping Qualities.	
Brown Globe .....	Aug. 12	Good	A good old variety of the true shape.
Blood Red .....	" 13	Good	A dark red variety; seems likely to keep a long time to come.
Brown Spanish .....	" 12	Good	A good useful sort of medium size.
Bedfordshire Champion ..	" 20	Good	Good shape; seems to keep well.
Deptford .....	" 13	Very good	A large variety, sandy brown colour, and good shape.
Danvers Yellow .....	" 12	Good	Much the same character as Bedfordshire Champion.
Flat Italian Tripoli ....	Sept. 1	Bad	Very much like the Blood Red in shape and colour.
Globe Tripoli .....	Late	Bad	These two varieties resemble each other both in shape and size. Kinds more suitable for autumn sowing.
Giant Rocca .....	Late	Bad	
Giant Madeira .....	Sept. 3	Bad	A large globular-shaped variety.
James' Keeping .....	"	Good	A nice compact-looking kind, much like Brown Globe.
*Naseby Mammoth ....	Sept. 12	Good	One of the best in this trial; fine for exhibition.
*Nuneham Park .....	" 12	Good	The same as Naseby Mammoth.
Neapolitan Marzagole ..	July	"	An early white variety.
New Queen .....	"	"	Similar to the last-named.
Reading .....	"	Good	A well-known good variety, but not so large as Naseby Mammoth.
Silver-skinned .....	"	"	Good for pickling.
Two-bladed .....	Aug. 12	"	An early variety of no great merit.
White Lisbon .....	"	Bad	Similar to Silver-skinned.
Welsh .....	"	"	Foliage upright; of no great merit.
White Spanish .....	"	Bad	Good for autumn use.
White Globe .....	"	"	The same as Brown Globe.
White Italian .....	"	Bad	The same as Silver-skinned.
Harrison's Improved Leicester .....	"	Good	Fine for exhibition, and rather larger than Nuneham Park and Naseby Mammoth.

Those marked with an asterisk (\*) are the best in this trial.

—R. H. D.

#### MYRSIPHYLLUM ASPARAGOIDES.

This beautiful and useful plant is not grown in any quantity as it ought to be.

An American friend, who has been in a florist's business in Boston fifteen years, going through the houses here, seeing a batch of this beautiful old favourite, speaks of it as follows:—

"This plant we grow in America by the thousand. I have a house 100 feet long and 20 feet wide devoted entirely to it; and although it grows yards in a few weeks, I have a difficulty to keep up a stock equal to the demand. It is used principally for making wreaths, house decoration, mixing with cut flowers, ornamenting the hair, trimming ladies' dresses for balls and parties, and is never sold for less than a dollar per yard. It is of very easy culture in a cool greenhouse or conservatory; it will grow yards in a few weeks from the time of sowing. It is planted in boxes or pots. Small twine is placed for it to cling to. It is very much admired here, and I hope before this is in print that I shall have thousands of it for decorating purposes." It is many years since this plant was introduced into England, but like many more old favourites it is east away to make room for the newer and less useful.—H. COMLEY, *Hendre Gardens, Monmouth.*

"We quite agree with our correspondent. It is many years since we saw its white flowers adorning a conservatory in winter. It is a native of the Cape of Good Hope, and was cultivated in this country as long ago as 1702.—EBS.

### THE MARMORA RAIDISSEUR.

FRUIT-TREE walls are now so frequently wired for convenience of training, as well as to prevent the brickwork being pitted with nail holes, that a cheap and efficient raidisseur or wire-strainer is sure to meet with extensive adoption. There are many such contrivances in use at the present time, but one of the simplest and most effective is that invented by the Abbé Marmora some years ago, and figured and described in the "*Revue*

The Marmora Raidisseur.

*Horticole*" and other French gardening periodicals. As will be perceived on reference to the engraving, it is on the same principle as the capstan. One end of the wire is passed through a hole in the middle of the capstan, which is in fact a small iron cylinder, and made fast to a hook in the wall. The wire is then unrolled and its other end fastened in the same way; the capstan is then moved to the centre of the length, and two pieces of iron wire, as thick as a quill and 8 inches long, used as levers, serve to turn the capstan and roll on it the wire from each side. When the wire is tightened-up one of the levers is left in its hole, the far end resting against the wall, or the U-handle against the strained wire, as a stop to prevent unwinding. For espaliers an S-shaped capstan is used, and the wire having been first passed through posts at the requisite distance apart, is carried through the hole in the capstan, and tightened-up by turning the two ends. When this is satisfactorily completed the ends of the capstan are placed vertically against the post to prevent the wire unrolling. A still more simple form of this wire-strainer consists in doing away with the bent handle, represented in the figure, and retaining the capstan alone, which in this case is made to turn in the grip of two hooks driven into the wall a short distance apart, or of one double-clawed hook.

### GARDENERS AT THE ROYAL PALACES.

In answer to a correspondent, "C. TORRENS," we have very little doubt that in fact there were gardeners, because there

were gardens, attached to the royal residences soon after the establishment of the Norman dynasty.

In the "*Liber Niger Domus*" of Edward IV. (1461-1483) are detailed the duties of the various officers of the royal household, and among them that the "Serjeant of the Confectionary" had the care of "dates, figges, raisounes, wardens, pears, apples, quinces, cherries, and all other fruytes after the seasonne." He was to take care that there was a sufficient supply "had of the King's gardynes, as cherries, peares, apples, nuttes greate and smalle, for some season, and for lenten wardens, quinces, and other." So there were royal gardeners then. In the "Privy Purse Expenses" of Elizabeth of York, afterwards Henry VII.'s queen, in the year 1502, mention is made of "the keeper of the litle gardyn at Windsor." Baynard's Castle, London, was also then a royal residence, and one entry is "to Walter Reynold, keeper of the garden at Baynardes Castle, for his wages for a hole yere ended at Michelmas last passed, sixty shillings and ten pence." We may reasonably conclude that "gardening and gardeners" benefited the community two centuries earlier, for from a MS. of cookery, written early in the fourteenth century, possessed by the Royal Society, we learn that there were served to table various preparations of (we retain the spelling) lekes, onions, cabaches, rapes, gourdys, green pesen, parsell, sage, saveray, ysopo, chebolles, mynt, peletur, costmaryn, fenell. At that time our grocers' currants were called "raisyns of corance."

Descending lower in the order of time we find mention of a gardener named Woolf, and Gough the antiquary says that he was a French priest. Henry VIII. (1509-1547) sent him to travel on the continent for the purpose of acquiring a better knowledge of gardening, and it is recorded that he brought back various varieties of fruits and vegetables. He was probably gardener at Windsor, for we find in the "Privy Purse Expenses of Princess Mary," in 1536, that "Jaspar was keeper of the garden at Newhall," or Beaulieu, as it was also called, another royal residence in Essex, and a "Frenche gardener at Westminster," probably St. James's, and this might be Woolf before mentioned. She also mentions "the keeper of the King's garden at Grenewiche;" he brought her "herbes and flowres," and on which occasion she gave him 2s. Mention is also made of "the Qwene's gardener at Hampton Court," and another entry shows that his name was Chapman, and that he carried Pears to Princess Mary; but six years later the gardener's name was Edmund, and he received 5s. for the Strawberries he brought.

Queen Elizabeth (1558-1603), among "artificers," in her pay had a "maker of hearb-bowes and planters of trees," his fee being £25. Her "gardiner" at St. James's fee was £9 2s. 6d.; at Hampton Court, £8 1s. 8d.; at Chelsea, £6 1s. 8d.; at Eltham, £11 11s. 4d.; at Greenwich, £7 8s. 2d.; at Richmond, £4 11s. 3d.; at Windsor "the keeper of the garden under the Castle," £4; and at Woodstock, £3 0s. 10d. Besides these she had in pay many keepers of parks and other appurtenances of her very many residences, among which it now reads comical that there was in "Maribone, keeper of the howse, Covent Garden and the woodes," his fee was £10.

We have before us an original order for the payment of Queen Elizabeth's gardener at Hampton Court. It was at the close of her reign, and the wages were higher than just named.

"MY VERY GOOD LORD,—This bearer, John Dinye, her Majesty's gardiner at Hampton Court, to whom her Majesty hath granted a Privy Seal of two shillings by the day for himself and tennence for his man, hath continued in daily employment there from the feast of the Birth of our Lord God last past, until the feast day of the Annunciation of our blessed Virgin Mary then next following, which I am from time to time to signify to your Lordship. And therefore I pray your Lordship that upon this my certificate he may receive his pay due unto him accordingly. At the Court at Whitehall this 27th of March, 1601.

"Your Lordship's very assured kinsman and friend to command,  
"NOTTINGHAM."

In King James I.'s reign (1603-1625) it puzzles us to discern why Alphonsus Fowle, keeper of St. James's garden, had £160 yearly, whilst Edward Lonnel, keeper of the garden and orchard at Richmond, had only 49s. 4d.

### OGSTON HALL.

THE RESIDENCE OF MRS. TURBUTT.

For natural scenery there are few English counties which can vie with Derbyshire. It does not present the soft rural landscapes of many of the more southern parts of the country, the thatched cottages nestling in the valley, or clustered round

the white-towered church, and forming a little village where all bespeaks a peace and comfort a closer inspection but too often proves to be imaginary; no, on the contrary, Derbyshire scenery is of a holder, wilder character, and as we travel northwards into the Peak district it becomes even majestic. From hill and dale and rapid river we pass to precipitous frowning rocks, foaming torrents tearing madly over their broken stony beds, dense woods, and wide moors, which when the Heather is in blossom are grand examples of Nature's colour-pictures. Although the natural features in the Alfreton district are not nearly so striking as those between Matlock, Buxton, and Chesterfield—where, too, there are numerous gentlemen's seats, foremost among them being Chatsworth and Hardwick Hall, belonging to the Duke of Devonshire—still the country offers many beautiful views from the ridges which rise up towards the hills. Capping one of these emi-

nences, and at a considerable elevation, is Ogston Hall, a handsome stone-built mansion, which as it at present stands may be considered an entirely modern mansion, having been in a great measure rebuilt by the late Mr. Turbutt, who was the principal landowner in the neighbourhood. At one time we believe it belonged to Sir Joseph Banks, but more of its history we are unable to say.

Adjoining the mansion is the handsome architectural stone conservatory seen in our engraving,\* and which forms, indeed, the most important feature in the garden at this season. It is 46 feet long, 22 feet wide, 24 feet high, and is furnished with excellent taste and effect. Occupying a vase in the centre is a handsome plant of *Picksonia antarctica*, and on the pedestal are grouped Chinese *Primulas* literally masses of bloom. Other groups of the same flower are placed here and there, and these with *Camellias*, *Epacris*, and *Cinerarias* give an

THE CONSERVATORY AND FLOWER GARDEN AT OGSTON HALL.

agreeable glow of colour to a house in which the green is not, as is often the case at this time of year, the predominant hue. Among other plants, besides Orange trees, *Cordylines*, *Lomaria gibba*, and *Chamerops humilis*, one of a good pair, of which the fellow was in another house, there were excellent specimens of *Aphelexis humilis*, *Polygala Dalmaisiensis*, a *Pteroma*, &c., which figure at the summer exhibitions of the district. *Rhododendron Edgeworthii*, one of the most fragrant as well as the most beautiful of the Indian *Rhododendrons*, here blooms freely; the plant, though not large, having generally from twenty to thirty blooms, and perfuming the whole house. Mr. Reynolds finds that it is necessary to keep it rather confined as regards pot-room, otherwise its tendency is to produce wood instead of flowers. It may be added that the plant is now showing indications of again flowering freely. Opening out from the conservatory is a small fernery, containing several good specimens of greenhouse Ferns of moderate size.

South of the terrace, in front of the conservatory and of the house as well, is a neatly-laid-out flower garden on grass, with beds converging towards a fountain in the centre, separated from each other by pathways of Derbyshire spar; and this again overlooks the croquet lawn, from which the ground slopes down to the lake, and a picturesque wooded valley beyond. Belts of shrubs, chiefly *Rhododendrons*, form the set-

ting of these terrace gardens, and in front of the shrubs in summer, flowers and coloured-leaved plants are ribboned and vandyked. Forming the background and shelter to the whole, as seen in the engraving, are lofty Elm, Beech, and Oak trees.

The kitchen garden is of no great extent, being less than an acre within the walls, and including an orchard there is perhaps as much outside; but it is remarkably well ordered. The paths are all asphalted, and in a pouring rain were clean and—well, not dry as one would be apt to say—but for walking practically so, and defined by a neat, dwarf, narrow, Box edging. The soil is light, apparently a decomposed sandstone, resting on the rock, and suits vegetable crops well, especially early ones, and fruit trees tolerably well, but the ground is very shallow in places. The wall trees are well managed; and some espalier Pears in front of the west-aspect wall border trained on high iron fencing are excellent examples of that mode of training, and very satisfactory in regard to production as well.

The extent of glass is but small. There is a small Peach house, forming a lobby to the vinerie, of which there are two lean-to's 24 feet by 16, one used as an early, the other as a late house. In the early division, besides the Vines were *Azaleas* and *Rhododendrons* to come into flower at Easter, likewise

a number of pots of *Lilium speciosum punctatum* and *album*, with which Mr. Reynolds, the gardener, is very successful; repotting the bulbs in November in peat, loam, and silver sand, placing three in a 9 or 11-inch pot, from which he obtains from twenty to thirty flowers, which render the conservatory extremely gay at the end of summer. In the late vinery there were some excellent Muscats hanging, though the best bunches had been cut, and Alicante was in good preservation. Some bedding Calceolarias had been removed thither, though Mr. Reynolds did not approve of the practice, as they are far more healthy and free from insects in frames; but there the mice attacked them and cleared off row after row, so that they had to be removed to the only available place of safety. In a span-roofed stove were good plants of *Maranta zebrina*, *Stephanotis floribunda*, *Cypripedium insigne*, *Dracena terminalis*, and some others; but the Poinsettias, with which it had recently been very gay, were nearly over; not so that useful plant *Euphorbia jacquiniiflora*, which was still in beauty. A lean-to orchard house, 33 feet by 12, is found very useful for a variety of purposes, as well as yielding an abundance of fruit. The practice is to plunge the pot trees out of doors when the wood is nearly ripe, and to plunge them in-doors when about to come into flower. For top-dressing, horse droppings and loam are applied when the trees are turned out, and when this dressing disappears horse droppings alone. Some small Pear trees planted out in the back border had borne well, especially Marie Louise.

We have only to add that the management of the place was highly creditable, especially as Mr. Reynolds has, besides the garden, the home farm of some eighty acres to look after.

#### NOTES ON VILLA AND SUBURBAN GARDENING.

VERY much of the pleasure of a garden will depend on the manner in which its walks are formed. A walk that becomes cloggy or slimy in wet weather or after frosts, or allows the water to lodge upon it during and after rains, and has a surface of coarse and harsh or loose materials, will do much towards deterring persons from using their gardens constantly, or at least will rob them of a good deal of enjoyment. Dryness can be obtained in a walk by shaping the ground properly in forming it, by rounding it slightly in the middle, by giving it a decided fall in some direction, and placing gratings and places for water at the lowest points, and by using suitable materials both for the foundation and the surface. In the ground formation of a walk a firm bottom should be obtained, and it should be pared as smooth as possible, keeping it from 3 to 6 inches higher in the centre, according to its width. At both sides the ground should be sloped gradually down for about a foot or 18 inches in width to the extreme margins, where it may be 6 or 9 inches deeper than at any other part. These extra cuts at the sides are to be filled with rougher materials, and to follow the general inclination of the walk for the purpose of drainage. By laying the groundwork of a walk thus high in the centre, and smoothly sloping to a kind of drain at each side, the utmost possible dryness will be gained.

The first operation on land will be to thoroughly drain it. No description of ornamental or useful plants will thrive well upon undrained ground that is not naturally dry and open, nor can such land ever yield any permanent enjoyment and comfort. A cold damp soil is decidedly uncongenial to both animal and vegetable life. Drainage is not merely valuable in the removal of stagnant water, which is so injurious to plants and so productive of discomfort; it also has the direct effect of making the soil warmer, and admitting air and gases freely. The temperature of ground that is saturated with water can never be greatly increased by whatever power of sun it may be acted upon, nor can air circulate properly through a liquid medium. Warmth and air to the roots being therefore essential to the healthy growth and fertility of plants, drainage becomes of the highest consequence in soils that are naturally wet.

In the greenhouse and pits proceed with potting plants for bedding-out. Calceolarias and other softwooded plants that require it may also be potted, taking care to drain the pots well. The propagation of plants for bedding-out may now be proceeded with, according to the number required; but clumps should not be kept shabby for the want of a few plants, as they are readily propagated at this season. For cutting-pots I generally use 18's prepared in the following manner: Over the hole at the bottom I place an inverted 60-sized pot, and round it potsherds broken small, over these some moss, and then fill-up with a compost of peat, sand, and leaf mould in equal quantities, leaving about half an inch of white sand at the top, which runs into the holes as the cuttings are inserted. A stock of pots thus prepared should be kept in a frame or propagating house, as nothing is so injurious to cuttings taken from plants growing in heat as to put them into cold soil. Cuttings cannot

be too short if they have the necessary buds to form a plant, neither can they be inserted too shallow if they are made firm in the pots.

Trenching vacant ground in preference to digging should at all times be practised if time permit. The amateur should endeavour to get the whole of his garden trenched over once in the course of three years at the farthest. He should go to the very bottom of the surface soil, taking care not to bring up the surface soil; this should be loosened with a fork deeply, and left in its place.

In the Vegetable department sow either on a slight hotbed or in pans the first crop of Seymour's White Celery, and some early Cauliflower, also a small crop of Impregnated Early White Broccoli. If the crops before recommended are not sown, no time must be lost in getting them in. Make your first sowing of Marrow Peas, also put in the last crop of early ones. Spinach, Lettuce, Radishes, both long and Turnip-rooted; Dutch Turnip, and Early Horn Carrot if wanted early, must be sown without delay. A good breadth of early Potatoes must be planted, and get the ground ready for Carrots in the early part of the month.

The first thing to attend to in the out-door planting is trenching the land. This must be done to a considerable depth, say about 2 feet or 30 inches. If an orchard or a flower garden is to be laid-out for the first time, the general drainage must be looked to before success can be hoped for; but if a new bed is only contemplated, or the planting of a single tree, the soil must be well disturbed, and if the subsoil is inclined to retain wet an artificial drainage of bricks and stones is desirable. The digging must also extend much beyond the hole necessary for admitting the roots of the tree. The further this is done the better, as it is often the case that the surrounding soil has not been disturbed for some time, and roots placed in a hole encompassed by such a hard mass will not ramify, but will be similarly situated with those in pots. Trees and shrubs should always be planted high to counteract the evils arising from unsuitable subsoils, and also to allow the air to get at the roots. People seem to think that, provided the stem appears above ground, it matters nothing where the roots are, and we often see newly-planted trees covered-up to the stem with paving stones or gravel. The nearer the roots are to the atmosphere, and the more porous the soil above them, the better. In the matter of roots the smaller ones should be carefully preserved, arranged round the tree as much as possible, and kept near the surface. It thus appears that in transplanting care should be taken to preserve the bunches of roots and fibres, which are too often torn from the stronger roots and left in the ground. It is to be lamented that even in some nurseries too little attention is given to this matter, for we often see trees sent out with only a strong stick of old roots attached, all that was really valuable having been cut or rent away. The remedy for this unworkman-like treatment is for amateurs to be more knowing on such matters themselves, and to refuse to purchase trees which are so roughly treated. Firmly tread-down and water, and your work is done, always remembering to keep a watch as to drought during the first months of spring and summer.

The seeds of all hardy and half-hardy annual plants should now be sown in their respective stations, some in the open ground, some in pots, some in cold frames, and some in a slight hotbed. Finish pruning all kinds of deciduous trees and shrubs which are not done. Attend principally to spring flowers, which are, perhaps, the most cheering which a garden can afford on account of the pleasing associations generally connected with them.

The amateur will find it interesting to note annually the time when his favourite plants come into flower, and when particular trees are leafing; and a series of well-authenticated facts on points such as these would not be without their use to professional gardeners.—W. KEANE.

#### DOINGS OF THE LAST AND PRESENT WEEKS.

ONE of the most important matters connected with a garden is the *water supply*. In districts where the rain-gauge registers over 21 inches in the year, watering out of doors cannot take up very much of the gardener's time. 1873 was not considered a dry season, and our rainfall was only 21.60 inches; in some seasons it has not reached 20 inches, and the soil being naturally dry it is highly necessary to water both flowers and vegetables out of doors, and if rain water can be obtained for this purpose so much the better. At all events it is of much importance to have it for watering pot plants, especially for Heaths, Azaleas, Camellias, and others of a hardwood nature. When the hot-houses were built at Loxford tanks were made at the same time to hold all the rain water that might fall on them, and so large has been the provision made that it is seldom necessary to use other than rain water for the plants and the Vine borders. There is a little extra expense when the houses are built, but this is more than compensated by the convenience afterwards. For instance, when a vinery is built it is necessary to go down at least 4 feet for the foundation of the walls, in order to allow of a foot

for drainage and 3 feet for loam, &c. If it is a high lean-to vinery the back wall must be 14-inch brickwork, and to make a sound tank at the base of this wall a little extra expense will be incurred in the first instance by carrying-up the inside 4½ inches in cement; the rest of the wall may be mortar. Another wall of 4½-inch work may be carried-up parallel to this, and at the distance of 2 feet 6 inches all the length of the house. The tank must now be thrown into divisions by walls of 4½-inch work, which will strengthen the other wall, and be more convenient for dipping-up the water. The cross walls should be about 6 feet apart; and as one tank is filled from the roof the water will overflow into the next, and so on until all are filled. The same arrangement should be made in all houses, so that plenty of rain water can always be dipped up. The insides should be coated over either with Roman or Portland cement. It would also be a great boon to gardeners if underground tanks could be made to receive the water that ran from walks or from other hard surfaces in the kitchen garden. It is a great convenience to have water laid-on by pipes from waterworks, or from a raised tank where the water has been pumped-up by some means, but it is well to bear in mind that no pump water is so good as rain water. The barometer had been falling for the last few days, and rain began on Thursday; it rained heavily on Thursday night, and on Friday morning the rain-receiver contained 0·65 inch of rain water. This was very acceptable to fill the tanks, as well as beneficial to newly-planted shrubs, which were suffering from drying east winds.

#### KITCHEN GARDEN.

The ground was in good order for planting, and as there were evident signs of rain the second early Potatoes were put out. There is no better sort than Dalmahoy for the second crop. The White Don is also good, but it is more susceptible of disease. Pricked out Cauliflower plants from seed-boxes into others, and removed them again into a cold frame. The plants that have stood the winter in hand-lights are looking well; some that were wintered in boxes will be planted out during the week. It is a good plan with these as well as other tender plants to draw a deep drill with a hoe and to plant in this; the plants are thereby sheltered a little from cold winds. Put the plants out about 2 feet apart each way.

Endeavour by all means to maintain a supply of good *salad*. Besides Lettuce, which was planted in a sheltered position in autumn and is now making good progress, a sowing was made under glass early in February, and the plants will be ready to go out in two or three weeks. Radishes under glass are in a forward state. Sowings must now be made for succession. Mustard and Cress may also be sown out of doors, but if there is convenience it is better grown under glass as yet.

Sea-kale may be covered with pots, and some fermenting material placed round them will be necessary to force it in quickly.

#### FRUIT AND FORCING HOUSES.

*Vineries* now take a large share of attention. In our earliest houses the Grapes are flowering. This is a very critical time, as the fruit does not now set so readily as it does in May. It is a good plan to go over the house twice a-day and gently shake the laterals, at 10 A.M. and 2 P.M. This serves to distribute the pollen. Another source of danger is to be found in the ventilation. During the present month east winds blow keenly, and at the same time the sun has a powerful effect upon the glass. There is thus a choice of two evils—the leaves being scorched on the one hand, or the Grapes becoming injured by rust on the other; both, however, may be avoided by skilful management and unremitting attention. Should red spider appear on the leaves, it is better to wash them by hand with a sponge dipped in soapy water. Sulphur applied to the pipes sufficiently strong to kill the spider, will certainly cause the Grapes to become rusty; when the berries are near the stoning period there is not then so much danger of this. When the fruit is setting, water should not be allowed in the evaporating-troughs. Damping the walls and paths of the house twice a-day will be enough at this time.

*Peach Houses*.—The growing sheets in the earliest house should be tied-down to the wires, and by all means avoid overcrowding; in most cases one leading shoot and another trained-up from the base of the last season's wood will be enough. No greater mistake can be made than to grow a thicket of wood which has to be cut-out at the winter pruning. The house may now be kept at 65° at night, with a rise of from 5° to 15° more in the daytime. There will be no red spider on the trees if they have been syringed daily with rain water which has been allowed to stand in water-pots over the hot-water pipes to become warmed before using it. We do not approve of using manure-water for Peach and Nectarine trees; but if the border is not rich, as Peach borders ought not to be, the surface may be dressed with manure to which a third part of loam has been added. This encourages the roots to come up to the surface, and all waterings from the syringe or otherwise wash the nutriment down to the roots.

*Figs in Pots*.—It is only in very large establishments that a house is entirely devoted to the culture of Figs; but where this

is the case the atmospheric conditions are similar to those recommended for Vines. A few trees in pots can be grown in any garden where there are suitable glass houses, and they succeed best when placed near the glass and freely exposed to the light. In such a position, if the fruit is required early, a night temperature of 70° may be maintained after the trees have started into growth. A high temperature before growth has commenced will cause the fruit to drop off. Water freely at the roots, and syringe the under sides of the leaves to destroy or keep red spider in check.

*Desert Oranges*.—The trees have passed through the flowering period, and the fruit seems to have set well. At the time of flowering, a dry atmosphere and a temperature of 65° are the most suitable for them. When the fruit has set, syringe the trees daily. The only insect enemy that attacks our trees is the brown scale, and the only way to cleanse the trees from this pest is to wash it off with a sponge and soft soap dissolved in warm water. The trees ought to be thoroughly cleansed from it, otherwise the leaves cannot be kept clean, or the trees maintained in health.

#### STOVE AND GREENHOUSE.

This is a trying month for tender stove plants, owing to the exceedingly changeable weather; drying winds and bright sunshine injure the delicate fronds of Ferns and young growths of plants. Instead of giving too much air it is better to put-up the shading, which ought to be attached to a roller, so that it may be readily rolled up or let down at pleasure. Caladiums which had been wintered underneath the stage had started to grow, and were taken out, watered, and removed to the Pine house. They will be turned out of the pots and repotted in a few days. Gloxinias, Achimenes, &c., should be started into growth now; the pots to be placed near the glass. The greenhouse or conservatory should now be gay with flowering plants. The principal work has been removing Hyacinths, Lily of the Valley, &c., that have gone out of flower, introducing a fresh supply, and re-arranging the plants. Tying and training the growing shoots of *Lapageria rosea* and *alba*; the latter is the stronger grower, the growths must be trained before they twine into each other. Camellias that have finished flowering should be placed in a hothouse or vinery at work to make their growth. If they make their wood early they will flower proportionably early next year. This is the only way to obtain early flowers, as the Camellia will not bear forcing to bring the plants early into bloom.

#### FLOWER GARDEN.

The zonal *Pelargoniums* have been in boxes longer than usual. It is better to pot them off in the autumn. In our case want of space was the reason they were not potted at that time, but we have now finished doing so; keeping the house close for a few days, and a little heat in the pipes, serve to start them into growth. Boxing-off *Verbenas*, *Ageratums*, and a few other bedding plants which succeed better in boxes than they do in pots. We also put in cuttings of *Verbenas* of which there is not sufficient stock. Many persons are very careful to make their cuttings of *Verbenas* at a joint, and this necessitates cutting over the plant lower than is desirable, whereas it is not at all necessary, as the cuttings will strike roots and form plants if there is no joint under the surface at all. Planted out the first lot of *Gladiolus*. Seedlings which had been grown in pots were watered after the leaves had died-down in the autumn, this caused them to start into premature growth; they were placed in boxes and removed to a house where they were kept cool, but from which severe frost was excluded. Some sandy loam has been placed round the roots.—J. DOUGLAS.

#### TRADE CATALOGUES RECEIVED.

J. Coombs, The Ferns, Enfield, Middlesex.—*Catalogue of Cuttings of Geraniums, &c.*

F. & A. Dickson & Sons, 106, Eastgate Street, Chester.—*Catalogue of New and Select Farm Seeds.*

George Poulton, Fountain Nursery, Angel Road, Edmonton, London, N.—*Catalogue of Dutch Flower Roots, Vegetable and Flower Seeds.*

#### TO CORRESPONDENTS.

N.B.—Many questions must remain unanswered until next week.

BOILER (Brooklands).—Write to the maker, and ask where you can see it in operation, and any other particulars you require.

GLASS CUTTER (J. L. King's Road).—Having tried it ourselves we can testify that you are mistaken.

PRUNING VINES (Robert Hughes).—The system upon which your gardener has pruned your Vines is quite correct. It is what is known as "the close-spur" or "single-rod" system. You will find that from every spur shoots will be emitted, and all you have to do is to encourage the strongest by rubbing-off all the weaker ones.

RATING MARKET GARDENERS' GLAZED STRUCTURES (J. A. P.).—We are of opinion that they are not rateable. All that we can say on the subject we said in our No. 622, page 183.

VINES AFTER PLANTING (Amateur).—If you have not yet planted the

Vines we should not do so until they had made shoots an inch or two long, but keep them in the house with the soil moist, and instead of pruning rub off the eyes, so that when the Vines are planted shoots will be produced at the bottom of the rafters, or where you wish for side shoots, at which point we should leave three shoots—two for spurs, and one to train-up for the rod. In planting, the roots should be disentangled and spread out, whether you plant now or after the eyes have broken. In the latter case the Vines should be shaded for a few days and watered. The temperature for the first month may be 50° to 55° at night, and 65° by day; for the second month 60° to 65° at night, and 70° to 75° day, on which a rise of 10° to 15° may be allowed with sun and air.

**PLANTING JERUSALEM ARTICHOKE (*A. Subsericea*).**—We fear your north border deprived the plants of sun and warmth needed for their full maturation. Give them an open and sheltered position, and a light soil if possible, well dug and moderately manured, and plant in rows 2 feet apart, the sets 9 inches or a foot from each other, and 6 inches deep. Plant at once. Last season was not a favourable one, but we attribute your non-success more to the position than the season.

**RULES FROM JAPAN (*Tom Mason*).**—A compost of equal parts light fibrous loam, sandy peat, and leaf soil, with a sixth part of silver sand, will no doubt be suitable, as it is for most bulbous plants. We should pot them so that the bulbs would be covered with soil level with their crowns, and, if there are any Lilliums, so that the pots may not be more than three parts filled with soil, to allow of the plants being top-dressed after they have made shoots a few inches long. They should be placed in pots, which should be drained efficiently, and in no case need exceed three times the diameter of the bulbs. The soil ought to be kept just moist until growth fairly commences, and then water more freely, but be careful not to water over the bulbs, especially not until they are well started into growth. Afford them a light airy situation. They will succeed in a greenhouse.

**VINES FOR SMALL VINERY (*Alipatis*).**—Your house being heated so that you can command a good temperature, and having also a pipe in the border, you may plant, as you propose, Duke of Buccleuch, Muscat of Alexandria, and Lady Downe's; but the first will succeed in a temperature much lower than is required for Lady Downe's, which we should omit, and have Madresfield Court.

**SOWING ALTERNANTHERA AMERINA AND COLEUS (*An Old Subscriber*).**—The Alternanthera is not difficult to raise from seed when this can be secured. The Coleus may be sown in pots filled to within three-quarters of an inch of the rim with sandy loam and leaf soil, two-thirds of the former to one-third of the latter, adding a sixth of silver sand, and making the surface fine and even; then scatter the seed regularly, cover about an eighth of an inch deep with fine soil, place in a hotbed, and keep moist, being careful not to overwater or the plants will damp-off. Keep near the glass, and when large enough to handle pot-off singly, return to the frame, keep shaded from sun until established, and shift into larger pots as the roots reach the sides, removing to the greenhouse in June, and hardening well off.

**DWARF LOBELIA—WHITE-FOLIAGED PLANT FOR CARPET-BEDDING (*Idem*).**—There is no dwarfier blue Lobelia than *pumila grandiflora*, which though not so deep a blue as some of the taller sorts, is nevertheless good. A dark blue sort is Brilliant of the speciosa class. Carter's Cobalt Blue is a clear pure blue. Antennaria tomentosa is one of the best white carpet plants and hardy, as is Cerastium tomentosum. The latter we consider best for your purpose.

**SOWING NERTEA REPRESSA (*R. S.*).**—The red capsules should be opened and the seeds scattered over a pot well drained and filled to within half an inch or so of the rim with fibrous loam, sandy peat, and a little leaf soil, making the surface very fine and even. Just cover the seeds with very fine soil. The soil should be watered before sowing the seeds. Place in a greenhouse, and cover with a hand-glass or a bell-glass, but it ought to be slightly elevated. Keep moist, and to lessen the necessity for watering, shade from bright sun. The soil ought to be moist. When the young plants appear admit air by raising the glass, and increase it with the growth, removing altogether in a short time, the main thing being to keep the plants from being dried-up, and, on the other hand, not soddened with wet. We should be glad if you would send us a few capsules. The Oviandra fenestralis would not have sufficient heat, we fear, in a warm sitting-room, but we should be disposed to give it a trial if you can command a plant without any great outlay. It would be a most interesting subject for a sitting-room, and if you succeed we should be glad to hear of it.

**GLASS FOR ROOF CONSERVATORY (*J. C. B.*).**—Rough plate glass is good and prevents scorching to a great extent. We use plate glass polished and ground on the side placed interiorly, and not so treated on the outward side. It answers admirably, but is more costly than rough plate. The ground glass is a quarter of an inch thick, and the rough plate ought not to be less. Ours is half an inch to five-eighths of an inch.

**ROSES OF 1873 (*J. W. B.*).**—It is impossible to give a reliable opinion on them yet. We do not know what you mean by "stopping Briars to prevent their dying-down below the shoot."

**SOILS (*Crow*).**—Either would do for potting if mixed in due proportions with other materials suitable to the plants to be potted.

**SUTTON'S RED-SKINNED FLOURBALL POTATO (*Sicklinghill*).**—It is a late round sort, good cropper, of good quality. You will find a coloured illustration of it in Messrs. Sutton's "Farmer's Year-Book."

**PLANTS FOR EXHIBITION IN AUGUST (*Young Exhibitor*).**—The Dracophyllum, Pimelea, and Kalosanthes you will need to retard, keeping them as cool as safety permits until June, when you may make an awning of tiffany to shield them from heavy rains and shade them from bright sun by day; but let them be exposed at night, unless heavy rains prevail, when covering should be placed over the plants. The Heaths will need to be kept back in the same way. As your house receives but little sun in summer it might be shaded and air freely admitted; thus you may keep them back nearly as well as out of doors. Keep the Polygala in heat until the growths are complete, and then remove to the cool house. It will flower when you wish it, but may need to be placed in a gentle heat again a month before the show. The Erythraea should be started early in April and begrown in a light house. Vallota should be placed in heat now, so as to get the growths forward, and by the middle of June it should have a light airy position in a greenhouse, giving no more water than will keep the plant from flagging. By introducing the plants into heat you may flower them when you wish, or they may not require forwarding. To have plants in flower at a stated time requires considerable judgment. No decided instructions can be given without seeing them, their present condition being everything.

**PLANTING LILIUM LANCEFOLIUM AND ATRATUM (*Horton*).**—Pot them at once in a compost of equal parts of fibrous loam, leaf soil, and sandy peat, with one-sixth of silver sand. After draining the pots efficiently place an inch of the rougher parts of the compost over the drainage, and three parts fill the pots with the compost thoroughly mixed and made fine but not sifted, and then introduce the bulbs, placing some silver sand under and around them, then make level with the crown with soil, pressing the latter gently round them. Place in the greenhouse and keep moist, increasing the supply of water as the growth advances, and afford the plants a light airy position near the glass, allowing for growth. Top-dress the plants when they show roots, as they will just above the bulbs on the stem, adding a fourth of well-rotted manure to the compost above named, bringing it level with the rim of the pot, but allowing a little space for watering. Victoria Aster we think the finest.

**IVY FOR WINDOW BOX (*W.*).**—The neatest Ivy, if you wish for a green-leaved sort is Donerailensis, and taurica is good. The neatest silver variegated is elegantissima. The small-leaved variety of Virginian Creeper (Ampelopsis Viticilla) would answer well; but both it and Ivy would take a time to cover the sides of the box, and would take in the soil, but not so much as to injuriously affect the growth of Geraniums, &c.

**FLOWERS FOR A VINE BORDER AND UNDER THE SHADE OF TREES (*M. A. B.*).**—It is bad practice to grow flowers in a Vine border. The gross habit induced by the rich soil may be avoided by surrounding the roots of the flowers with soil of a poorer description. Polemoniumeruleum variegatum, or the Golden Tricolor Geranium Lady Cullum, would answer in place of the Calceolaria. Santolina incana, by its neat, dwarf, and very compact growth, forms an admirable substitute for the Cerastium, to which it is really superior. Propagate the Viola by cuttings now, plant in the beds in May or June, and it will continue in full beauty till the autumn. Chenopodium atriplicifolium raised from seed sown in March will probably answer well in your climate as a substitute for Humea. The tall-growing scarlet Lobelia, too, make capital central groups: the dark crimson stems and foliage crowned by bold spikes of a deep, rich, liquid scarlet producing a very fine effect. The old stools are taken up late in autumn and kept in a cool pit or frame during winter, and abundant offsets may be taken any time during the present month. If you are unacquainted with this lovely and important species, do not confound it with the dwarf blue kinds, from which it is totally distinct. There is no flower of the same colour equal to the blue Lobelia. Have you tried L. pumila grandiflora? Its deep blue flowers are produced abundantly, and its habit of growth is very dwarf and compact. Vesuvius Geranium will not answer under the shade of trees; besides, the effect of a line of it next Beet would be extremely sombre and heavy, more particularly in such a position. Substitute for it the elegant grey-leaved Centaurea Clementei or C. ragusina. Do not hesitate to repeat the grey, for it will impart precisely the air of brightness that you require.

**POTATO PLANTING (*A. P.*).**—The crown cut off, as recommended at page 175, is not to be planted. The cluster of eyes of the crown produces a group of small weak stems if it be planted, that weakens the more robust stems produced from the large eyes.

**VINE ROOTS DECAYED (*S. A.*).**—We planted a viney in three divisions, and the borders were made up of turfy loam, crushed bones, charcoal, and lime rubbish, with the addition of some rotted manure. The borders were well drained and aired. The first year the Vines grew to the top of the rafters, and the canes were all that could be desired; but what was our surprise to find the second year that many of the roots were dead, and others decaying similar to yours. The third year there was no improvement. In the fourth about 3 inches of the surface soil was removed, and some turfy loam put in its place; the roots eagerly ran into this, and the Vines have done well ever since. The soil you have sent is very similar to that of which our border was made; what we surface-dressed with was of a much lighter nature. Roots similar to yours were forwarded to us from a gentleman about this time last year, and his border had been made on the most approved principles. Probably the soil is too retentive in your case, as it was in ours. You ought to remove 6 inches of the surface of the border, and replace it with some turfy loam of a more sandy character; the turf should be cut only 2 inches deep.

**CAMELLIA—GERANIUM LEAVES (*C. L. T.*).**—We cannot name the varieties of the Camellia or any other florists' flower. The leaves indicate that the roots of the Geranium do not supply sufficient sap. Try watering with very weak liquid manure.

**PARTLY OBLITERATED NAMES (*J. L.*).**—1, Enfant Amoureux; 2, Empereur de Maroc; 3, La Ville de St. Denis; 4, Monsieur Nomin. There is a Rose called Gloire de Ducher, but none called "Ducher" alone.

**NAMES OF FRUITS (*L. Holmes*).**—2, Golden Winter Pearmain; 3, Claygate Pearmain; 4 and 5, Dumelow's Seedling; 6, Golden Russet; 7, Boston Russet.

**NAMES OF PLANTS (*F. E. T.*).**—Habrothamnus fasciculatus. It is a native of Mexico, and was first bloomed in the Chiswick Garden of the Horticultural Society in 1845.

## POULTRY, BEE, AND PIGEON CHRONICLE.

### BLACK BANTAMS.

Not long ago exhibitors of Black Bantams had, generally, to be content with showing their fowls in the "Any other variety" class, there seldom being any other class in which they could compete, and the consequence was Black Bantams were neglected, and by only a few were care taken in breeding them. But now the committees of most of our poultry exhibitions have allotted a separate class for Black Bantams, with a result most gratifying to the exhibitors and encouraging to the committees. Fowls of this variety which only three or four years ago took prizes at our leading exhibitions would now, if in existence, very often find it difficult to obtain a place at many of the local shows.

In most of our poultry books only a limited space is devoted to the description of these fowls, which description is, in many cases, very scant and without attempting to enter into detail; and it is with a knowledge of this defect in our poultry lore

that I am persuaded a detailed description of Black Bantams will not be unacceptable, to some few amateurs at least.

Black Bantams are of diminutive size, the cock never exceeding, when full grown and in good condition, more than 20 ozs. at the utmost in weight, and the hen weighing about 2 ozs. less than the cock. The plumage of both sexes is of a very rich black throughout. The hackle of the cock is full, the feathers of the saddle and hackle being long, those of the latter flowing well over the shoulders. The tails of both cock and hen are full and expanded, and are carried upright; the cock's tail is adorned with handsome well-curved sickle feathers. The comb, which is double, and fits close and straight on the top of the head, without inclining on either side, is square in front, and is very much more developed in the cock than in the hen. The comb, the top of which is covered over with small points, has a peak behind which turns slightly upwards. The wattles of the cock are rather long, broad, thin, and well rounded on the lower edge, those of the hen being very small and thin. The comb and wattles, as well as the face, are of a bright vermilion colour. The head is small and round, and is carried very erect by the hen; and by the cock is carried well back towards the tail. The beak is rather short and curved, being of a dark horn colour, or black, becoming rather lighter towards the point. The deaf-ear, which is one of the chief points of beauty, has a flat and even surface, without wrinkles, and is of a pure opaque white, free from any stain. The deaf-ear is a beautiful contrast to the rich black plumage and the bright red of the comb, wattles, and face. The carriage of both cock and hen is upright and strutting, the cock being particularly bold and erect, with a very proud gait. The breast is round and prominent, and is carried forward by the cock. The neck of the cock is very taper, and is gracefully curved well back, so as to bring the back of his head into close proximity with his tail. Their legs are short and clean, and of a dark leaden colour, or black; their thighs are also short.

Many exhibitors of Black Bantams confine their fowls prior to exhibiting them in a dark and warm room, which has the effect of increasing the purity of whiteness of their deaf-ears, which are apt to become tinted with red from too much exposure.

There are many amateurs who have not sufficient accommodation to keep the larger breeds of fowls, but who delight in keeping a few Bantams, and to these I could not recommend a prettier variety than the Black. They are hardy, moderately good layers, and the chickens are not difficult to rear.—WALTER B. ARUNDEL.

### OBJECTING TO JUDGES.

YOUR correspondent of last week draws the attention of fanciers to the practice of parties forming themselves into rings or cliques against certain judges officiating at shows, and sending their entries subject to the condition that if a certain judge officiates their entries are to be returned. Such conduct is reprehensible in the extreme. If such conduct were to be followed we should very soon have no judges at all. There are various ways in which such practices can be put a stop to. First, committees should be above cringing to the dictatorial views of any rings or cliques, and appoint their judges fearlessly. Second, as soon as the schedule of the show is prepared have the judges engaged and publish their names along with the schedule. If such simple rules were attended to, shows upon the whole would be better patronised by the true fancier. In this northern part of Her Majesty's dominions there have been several shows where I and others would not enter our birds because the judges' names were not published, and we had not the confidence in the parties who were reported as being engaged to judge. Our surmises were right, for the judging has given general dissatisfaction. I do not think your correspondent need fear that the combinations he refers to are likely to be of long standing, or ever to be acted upon except in isolated places, but I am sure that if the hints I have given were attended to there would be no cause of that fear described by your correspondent.—A NORTH-EAST-COAST-OF-SCOTLAND FANCIER.

YOUR correspondent in his remarks on "Objecting to Judges," in last week's issue, proclaims the existence of a "clique" or poultry exhibitors' league. Will he further enlighten the fancy by stating where such institution exists, and how it may be communicated with? If its *modus operandi* is not aggressive but strictly defensive, and if its council be rightly directed, it may add very materially to the stability of some of our present poultry societies, and ought to be known. I fail to discover the force of your correspondent's argument, or rather I cannot view it from the same standpoint. He complains that the prospects of Mr. A have been destroyed as a judge by the combination of a few fanciers. It must be assumed that this Mr. A has been tried as a judge (or there would be no pretext), and his awards have proved conclusively that he does not possess the necessary qualifications of an efficient judge. Few will deny that the sooner such a person passes into oblivion, so far as the

poultry world is concerned, the better, though the result may have been effected by a coalition of the fancy; fewer still will, I think, "act in concert" to utter a wail of plaintive sympathy for the blighted prospects of such a judge with "RESPICERE AD FINEM." If in answer to the "outcry on all sides for more judges" gentlemen usurp the office who are incompetent, and whose decisions subvert those of our most able, popular, and oldest judges, what more reasonable than that a "few individuals should act in concert" for the removal of such novices?

The appointment of judge deserves far more careful attention than it receives at the hands of the promoters of some of our poultry exhibitions. The arrangements of a show may be most honourably and laboriously carried out to their minutest details, but an error in selecting a judge will prove a fruitful source of disappointment and dissatisfaction.

Through the courtesy of the secretaries to the different societies, I receive, being an exhibitor at all the large shows, a schedule of the prizes of the coming exhibitions. My first concern is to ascertain the name of the judge; in some lists this is "conspicuous by its absence," I therefore consign such, without further ceremony, to the waste-paper basket.—PRO BONO PUBLICO.

I AM glad to find that a letter has been written to your Journal complaining of the errors of those who object to certain judges. It appears to me, that so long as the names of judges are hidden from the public and exhibitors until the exhibition opens, so long is there just reason to object. There is a very great deal of annoyance and dissatisfaction caused by the names of judges not being known to the intending exhibitor at the time the entries are made. I have been a large exhibitor for many years, and I certainly do most strongly protest against committees not advertising the judges' names on their prize schedules. For instance, we have all our likes and dislikes, and I have often seen birds that have received the cup in their class at one show under one judge, at the next show passed by unnoticed by another judge. Considering the enormous charges railway companies levy upon all exhibitors for carriage, and the amount of entry fees, I certainly do think it would have a most beneficial effect if every committee published the names of their judges on the prize schedule. I quite agree that a new set of judges is necessary, but I am sure we have several gentlemen who act at present and whose valuable services we could not afford to lose.—A LOVER OF FAIR PLAY.

### DORCHESTER POULTRY AND PIGEON SHOW.

THERE were good shows at Dorchester twenty years ago. They were held under difficulties. They had no convenient place for them. Much zeal and management did contrive to put-up pens in the West Market. It was one of the good shows of that time. The Cochins of Essex and Suffolk, the Dorkings of Sussex and Lancashire, the Ducks and Geese of Buckinghamshire met there to compete for the pieces of plate for which the ancient town was famous. It had the reputation of giving things of intrinsic value. And then, like many others, they were given up and became things of the past. "*On revient toujours à ses premiers amours.*" The snake was scotched and not killed, and the good old Roman town woke-up one day determined to begin again. It possessed all the requisites for success—good funds, energetic men, and an inestimable fund of experience in the person of Mr. Andrews, so well known as a former breeder and great judge. There was no longer any difficulty. A pretty and commodious building has lately been erected for town hall, market, or general purposes. Spacious, lofty, well lighted, and airy, it left nothing to desire when it was proposed to use it for this Exhibition. It had another great recommendation—the lighting being from above there are no draughts. Its walls are hung with shields and otherwise decorated, and at the extremity a music gallery gave ladies the means of standing and enjoying a very pretty *coup d'œil*. It is a great point, where anything is contrived for public amusement and must depend on the public for support, to start with all necessary appliances. An apology is a bad beginning. The culprit is afraid of the verdict when he applies beforehand for the benefit of extenuating circumstances; and so when one of a body of promoters and managers begins by saying you must excuse this and that, other wants are found or imagined; and the man who is working for others is advised, before he helps to get up another, to go to Bingley Hall or Manchester, or some other great show. He is told he cannot compare with them. They are Callipash and Callippee, while he is calves' head, and

"Calf's head hashed must be confessed  
To be mock turtle at the best."

We have often thought it would be wise to station people at the entrance to a show for the purpose of assuring everyone the place was crowded. Once assured that a place is inconveniently full, gout and corns are forgotten, and babies in arms afford no argument for staying away. "Good wine needs no bush," and Dorchester had nothing to apologise for, or to explain away.

Market-room and town hall were both full of pens, and they were full of good birds. The low at the end of the room was fitted with large and commodious cages, tenanted by the various Pheasants and wild fowl. The entire flooring of these cages was composed of close-cut turf. A large reserve pile of the same was in requisition to replace any that might be scratched to pieces, or otherwise become an eyesore. The small alcove behind was occupied by three purple-velvet rising shalves, on which were displayed cups, showing that true to tradition they were worth their nominal sum. The Show was crowded, and the life of the county were there. Everyone was glad it was revived, and hoped it would continue. So did we. Our notice of the different classes will be of necessity short. Full information is supplied by the prize list which appears in this number.

The *Game* were very good, especially the Brown Reds that took the cup. In these, as in other classes, there were good specimens from the Channel Islands. We are, however, of opinion that there is a tendency to breed them too leggy. A *jocosus puer* in these classes had perpetrated a joke. Wishing to exhibit five very beautiful tame Partridges, he had entered them in the Game classes. The Coloured *Dorkings* were worthy of any show; the Silver-Greys weak, the White *Dorkings* marvellous; many of the hens weighed over 9 lbs. each, and one cock 10½ lbs. The *Spanish* were excellent, so were the *Cochins*, but the Grouse carried the cup from Buff, White, and Black. There were three pens of the latter. There were forty-five pens of *Brahmas*; the Light took the cup from the Dark. They were good classes, but in many of these, as in the *Cochins*, the feathering is becoming preposterous, presenting a huge mass of fluffy feathering without shape, form, or symmetry. There were fifty-four pens of *Hamburghs*. The Golden-pencilled were beautiful and perfect. Golden and Silver-spangled were very good, but we cannot understand why the Silver-pencilled should have fallen off so much, and should everywhere cut such a sorry figure. We saw among the Silver-spangled that which was common formerly, but very rare now, a henny-tailed cock. *Polands* and *Malays* were competitors for one cup. They were both well represented in every way, but the former were strong enough to take away the cup. We have seldom seen better birds than were shown in these classes. *Houdans* and *Crève-Cœurs* are become poultry facts, but we were surprised to see five pens of good *La Flèche*. Many of the *French* birds were of great size. The *Various* were various and curious. *Game Bantams* had the same number of classes as their larger brethren. They brought between forty and fifty pens, among them some of the best *Duckings* we ever saw. Seventy-three pens of selling poultry, single cock or pair of pullets not exceeding 30s. in value: these are essentially popular classes, they afford an outlet for extra stock, and a moderate but reliable market for purchasers. The sales were very numerous.

*Geese*, *Ducks*, and *Turkeys* were all good.

The entries for dead poultry were bad, only one prize was awarded, and we would not give much for the recipients. Much may be made of this class, and it will be done under proper management. Fifteen competitors for three prizes for eggs. This class, again, has a future before it.

The *Pigeons* were numerous, and many of them very good. The Committee were at the Show early and late, and richly deserved their success.

**GAME.**—*Black-breasted Reds*.—J. W. H. Stagg, Netheravon. 2, J. Mason, Worcester. 3, J. Voisin, Jersey. 4, E. W. Wallis, Herringstone. 5, E. Martin, Southleigh, Fakenham. *Brown-breasted Reds*.—1 and Cup, F. Warde, West Farleigh. 2, T. Lovering, Capra, St. Austell. 3, J. Browne, St. Austell. 4, F. Warde, H. E. Martin. *Any other variety*.—1, J. Voisin. 2, E. Martin. 3 and 4, E. G. Farquharson, Blandford. 5, D. Thomas, Brecon.

**DORKINGS.**—*Coloured*.—1 and Cup, L. Patton, Hillmore, Taunton. 2, T. C. Zarnell, Micheldever, Hants. 3, J. Mercer, Burton Bradstock, Bridport. 4, G. N. Thomas, Beaminster; P. J. De Carteret, Jersey. *Silver-Gray*.—1, Withheld. 2, L. Wren, Lowestoft. 3, T. Moore, Yeovil. *White*.—1, O. E. Cresswell, Early Wood, Lagshot. 2, Mrs. M. A. Hayne, Kingsand, Devonport. 3, H. Feast, Swanses. 4, P. Rundle, Lostwithiel. 5, Mrs. M. A. Hayne; Mrs. T. Pope, Corsley, Warminster.

**SPANISH.**—1 and Cup, J. R. Rodhard, Wrington, Bristol. 2, J. Newick, Hinton St. George. 3 and 4, E. Jones, Clifton.

**COCHINS.**—*Cinnamon and Buff*.—1, R. Osborne. 2, W. H. Crabtree, Levensall. 3, Mrs. E. Allsopp, Worcester. 4, J. A. Llan, Evershot. 5, Capt. T. S. Robin, Petit Mesnage, Jersey. *Partridge*.—1 and Cup, G. Lias, Par Station, Cornwall. 2 and 4, Hon. Mrs. Sugden, Wells, Somerset. 3, C. Ingram, Blandford. *Any other variety*.—1, W. Whitworth, jun., Longsight, Manchester. 2, S. B. Perry, Lymington. 3, Mrs. E. Holmes, Bath. 4, C. M. Hole, Tiverton.

**BRAHMAS.**—*Dark*.—1 and Cup, Newham & Manby, Wolverhampton. 2, Horace Lingwood, Creeting, Needham Market. 3, J. Mercer, H. W. Castle, Kensington, London; H. Feast, W. H. Crabtree, J. T. H. Waterman, Brierley, Devonport. *Light*.—1 and Cup, J. Woodroffe, Cheltenham. 2, T. A. Dean, Maiden, Hereford. 3, H. M. Maynard, Holmwood, Ryde, Isle of Wight. 4, C. Jones, Hanford, Blandford; Mrs. E. Holmes; W. H. Crabtree.

**HAMBURGH.**—*Gold-pencilled*.—1 and Cup, H. Moore, Weston-super-Mare. 2, G. Packham, Exeter. 3, J. Robinson, Garstang. 4, C. Bloodworth, Cheltenham; H. Moore; T. Aspin, Church, Ayrington. *Silver-pencilled*.—1, J. Rhodes, Hyndburn, Ayrington. 2, N. Barter, Plymouth. 3, H. Feast. *Any other variety*.—1 and Cup, Mrs. J. Pattison, Dorchester. 2, T. Walker, jun., Denon, Gloucester. 3, J. Robinson. 4, J. K. Harris, Warminster. 5, J. Henson, Stonehouse, Gloucester. *Silver-spangled*.—1, Ashton and Routh, Broadbottom, Mottram. 2 and 3, Mrs. J. Pattison. 4, N. Barter; J. Robinson.

**POLANDS.**—1 and Cup, J. Hinton, Warminster. 2 and 3, T. P. Edwards, Lyndhurst, Hants. 4, S. Probert, Lostwithiel; T. P. Edwards; C. Bloodworth. **MALAYS.**—1, S. R. Perry. 2, G. White, Christchurch. 3, J. Hinton. 4, Rev. N. J. Ridley, Newbury. 5, S. Routh, Chesterfield; Rev. A. G. Brookes, Shrawadine Rectory, Shrewsbury.

**HOUDANS.**—1, W. Dring, Eversham. 2, W. Whitworth. 3, W. H. Copplestone, Blandford. *Lostwithiel*.—1, Mrs. C. Hall, Fox, Alton; P. J. De Carteret. 2, Viscountess Chetwynd, Marpool Hall, Exmouth.

**FRENCH.**—*Any other variety*.—1 and Cup, W. Dring. 2, G. De Faye, Jersey. 3, Rev. C. C. Eyband, Buzlewade.

**ANY OTHER VARIETY.**—1, W. Wilkey, Cosham, Hants (Andalusians). 2, R. S. Woodgate, Penbury, Tunbridge Wells. 3, Mrs. E. Holmes.

**GAME BANTAMS.**—*Black-breasted Reds*.—1, E. Payne, Cardiff. 2, R. Doncer, jun., Parkstone, Poole. 3, W. Boucher, Notting Hill, London. 4, E. Wing, 441, Worcester. 5, F. Fielder, Southsea. 2, S. & J. J. Stephens, Ebury, Stroud. 3, J. Long, Bromley Common. *Any other variety*.—1 and Cup, Master M. V. Sandford, Dover. 2, E. Payne. 3, G. S. Sainsbury, Devizes. 4, J. Long; W. Boucher.

**BANTAMS.**—*Gold and Silver-laced*.—1, C. H. Poole. 2, Mrs. Hambro, Milton Abbey, Blandford. *Any other variety*.—1, B. F. Parrott, Henbury, Bristol. 2, R. S. Woodgate. 3, Mrs. Hambro. 4, R. H. Ashton, Mottram.

**SELLING CLASS.**—*Cock or Cockerel*.—1, Miss E. Brown, Chardleigh Green, Chard, Spanish. 2, F. L. Turner, Dorchester (Brahmas). 3, Mrs. M. A. Hayne (Brahmas). 4, A. Martin (Cochins). 5, Mrs. J. Pattison (Hamburgh); A. Martin (Cochins); A. E. Smith, Gosport (Cochins); T. P. Edwards (Poland); O. E. Cresswell (Cochins). 6, Mrs. Neville-Grenville, Glastonbury (Houdan) (2); F. L. Turner (Brahmas); Capt. T. S. Robin (Cochins).

**SELLING CLASS.**—*Hens or Pullets*.—1, Mrs. E. Allsopp (Cochins). 2, J. Stagg (Hamburghs). 3, W. T. Lovering (Game). 4, F. L. Turner (Brahmas). 5, Mrs. J. Pattison (Hamburghs) (2); C. Bloodworth (Cochins); Capt. Hon. E. Digby, Cerne (Dorkings); H. Moore (Hamburghs); T. P. Edwards (Polands) (2); Miss E. Browne, St. Helier's, Jersey. 6, J. Wimbly (Spanish); C. Bloodworth (Bantams); W. H. Dawkins, Wynford, Maiden Newton; Lady E. Thynne, Lavestock, Salisbury (Spanish).

**DUCKS.**—*Aylesbury*.—1, W. Mansfield, Dorchester. 2, Rev. R. Smith, Stafford Rectory, Dorchester. 3, Withheld. *Rouen*.—1, J. Crane, Southey, Dorchester. 2 and 3, T. J. Mercer. 4, J. Mercer; Capt. Hon. E. Digby. *Black East Indian*.—1, J. W. Kellaway, Merston Cottage, Isle of Wight. 2, G. S. Sainsbury. 3, W. H. Stagg. 4, Mrs. M. A. Hayne (2); G. S. Sainsbury. *Any other variety*.—1, R. Wilkinson, Guildford (Carolina). 2, Capt. J. W. B. Hawkesworth, Stokeford, Wareham (Peruvian). 3, J. Croote, jun., Wellington, Somerset. 4, W. B. Ford, Weymouth (Muscovy).

**TURKEYS.**—1, L. Patton. 2 and 3, A. Martin. 4, W. Mansfield (2). **GEESSE.**—1, W. H. Dunman, Troystown, Dorchester. 2 and 3, W. Mansfield.

**PIGEONS.** **CARRIERS.**—*Cocks*.—1, H. Yardley, Birmingham. 2, J. H. Watkins, Hereford. 3, J. C. Ord, Fimlico. 4, B. Ford. *Hens*.—1 and 2, J. H. Watkins. 3, H. B. Ford; H. Yardley.

**FOUTERS.**—*Cocks*.—1 and 2, B. Pratt, Knowle. 3, Mrs. Ladd, Calne. 4, Rev. C. Bullen, Bath. 5, J. H. Watkins. *Hens*.—1, H. Pratt. 2, Rev. W. C. Bullen. 3, Mrs. Ladd. 4, Rev. H. C. Bullen; H. Pratt. 5, J. H. Watkins.

**TRUMPETERS.**—*Almond*.—1, H. Yardley. 2, J. Andrews, Poole. *Balds or Beards*, or *Any other variety*.—1, H. Yardley. 2, G. Packham. 3, B. Ollis, Devizes.

**JACOBS.**—1, J. Andrews. 2, H. Yardley. **BABBS.**—1, H. Yardley. 2, J. H. Watkins.

**FANTAILS.**—1, J. F. Loversidge, Newark. 2, H. Yardley. 3, Miss S. Dickinson, Kingweston, Somerset.

**NICES.**—1, G. Packham. 2, J. P. Mills, Exeter. 3, H. Yardley. **TURBOTS.**—1, G. Packham. 2, H. Yardley. 3, J. Andrews.

**DRAGONS.**—*Silver.*—*Cock or Hen*.—1, 2, and 3, W. Bishop, Dorchester. 4, H. Yardley. 5, W. H. Mitchell, Moseley, Birmingham. *Blue.*—*Cock or Hen*.—1, W. H. Mitchell. 2, W. Bishop. 3, H. Yardley. 4, G. Packham. 5, Red or Yellow.

*Cock or Hen*.—1, S. C. Betty, Park Street, Regent's Park. 2 and 3, W. H. Mitchell. 4, S. C. Betty; W. H. Mitchell. 5, H. Yardley. 6, G. Packham; W. Bishop. 7, W. H. Mitchell.

**ANTWERPS.**—1, H. Yardley. 2, J. Andrews. 3, W. H. Mitchell. **ANY OTHER VARIETY.**—1 and 2, H. Yardley. 3, J. W. P. James, Hereford. 4, G. Packham. 5, J. H. Watkins.

**SELLING CLASS.**—1, A. P. Maurice, Bourton, Bath. 2 and 3, J. H. Watkins. 4, H. Yardley. 5, G. Packham; W. Morris, Westbank, Ross. 6, Capt. Hon. E. Digby; F. F. Lee, Canal, Salisbury.

The Rev. G. F. Hodson and Mr. Bailly judged the Poultry; Mr. Allsopp the Pigeons.

## KING'S LYNN POULTRY, PIGEON, AND RABBIT SHOW.

This Show was held, in conjunction with that of dogs, in the Corn Exchange, King's Lynn, on the 26th and 27th February. Turner's pens were used on the occasion, and served to display the birds in excellent style. The prizes were but 20s. and 10s. and no cups or other extras, therefore not a sufficient inducement to draw valuable poultry from the breeding pens at this time of year. The entries were not heavy, but yet sufficiently large to promise an excellent future for the Society with a schedule of prizes of greater value, which, we were assured, is contemplated for another year. The Show was well managed in every respect, the Honorary Secretaries being constantly present, showing a determination to oblige, and superintend matters themselves.

*Dorkings* were not numerous; the Dark Greys but poor, but the Silvers much better. *Cochins*, Buff, were good in both classes: while in cocks of Any other variety a capital White was placed first, and in hens a Black of rare excellence. *Brahmas*, Dark, in both classes were but poor, while the Light were of fair quality. Next came *Game*, Brown Reds winning in the cock class, the first a grand cockerel, the second an old cock, good in colour but somewhat shy. In hens a grand Brown Red stood first, and a Black Red, of high quality but rather long in body, was second. Any other colour, cocks, *Duckings* were first and second, and in hens a *Pile* was first and *Duckwing* second, both being good birds. The *Hamburghs* may be taken as a lot, the winners being mainly good, but the rest very poor. Of *Spanish* there were but two pens, but both very good; and the same remarks will apply to *Polands*. There were eight entries in *French* fowls, and the class was uncommonly good, *La Flèche* being first and *Crève-Cœurs* second; and in the Variety class the first were *Malays*, the second Black *Hamburghs*. As is generally the case in the eastern counties, the Selling classes were well filled, and some very good birds changed hands. *Bantams*, Black or

Brown Reds, a good pair of the latter variety came first and Black Reds second, but all the others were very poor. In the next class Piles won, both pairs being good, but the second very dirty. The next was a grand class, first Blacks and second Japanese, while many good pens were only commended. Ducks in both classes were good for this locality, which does not stand pre-eminent in aquatic birds. In the Variety class Carolinas were first, with Black East Indian second.

Pigeons were very scant in entries, and yet each class contained some good pairs or single birds, this applying particularly to the Carrier and Pouter classes; the first-prize Black Carrier hen being a grand bird and in nice bloom, while the winning Pouters were in good show. Fantails were such as can only be seen when our Newark friends compete. Dragons, Blue, were good, but the best pair of Dragons were the first-prize Yellows in the next class. In Jacobins the winners were Red and very good, but the Antwerps, if we except the first-prize pair, were bad.

Rabbits were a good show, the Lops doing great credit to their owners; a Fawn being first and Sooty Fawn second in bucks, and in does the first was Torteiseshell and the second Blue-and-white, the latter, a doe of grand quality, requiring only condition to bring her to the front. Most of the Silver-Greys were noticed, and it is seldom a better collection is seen together. For any other breed, buck, a neat Himalayan was first and a Belgian Hare second, and in does a most exquisite Blue-and-white Dutch was first and a massive Angora second. In the Selling class a good Lop-car was first.

**DORRINGS (Coloured).**—Cock.—1, Mrs. G. Clark, Long Sutton. 2, H. H. Rash, Heybridge, Malden. 3, County, E. M. Southwood, Eddisbury. Hen.—1 and County, E. M. Southwood. 2, Mrs. G. Clark. 3, H. H. Rash.

**DORRINGS (Any other variety).**—Cock.—1, L. Wren, Lowestoft. 2 and County, T. & H. Heath, Norwich. Hen.—1, L. Wren. 2 and County, T. & H. Heath.

**COCHINS (Cinnamon or Buff).**—Cock.—1, 2, and County, Major Bignold, Norwich. 3, G. F. Bently, Linton, Cambs. 2 and County, Major Bignold, Norwich. Hen.—1, G. F. Bently.

**COCHINS (Any other variety).**—Cock.—1, R. S. S. Woodgate, Pembury, Tunbridge Wells. 2 and County, Major Bignold, Norwich. Hen.—1 and County, R. S. S. Woodgate. 2, J. A. Sleep, Kingsland, London. Hen.—1, J. F. Walton, Rawtenstall. 2, J. A. Sleep. Extra 2, T. M. Derry, Gedney, County, Major Bignold, Norwich. Hen.—1, R. S. S. Woodgate.

**BRAMMAS (Dark).**—Cock.—1, J. Watts, King's Heath, Birmingham. 2, W. R. Garner, Ryke, Bourne, County, W. Branton, East Dereham. Hen.—1 and County, E. H. Willett, Norwich. 2, J. Watts. 3, Miss Blake, Bracondale, Norwich. Rev. T. Wren, Heybridge, Malden. W. R. Goodrich, Horton Green, Bradford. 2, G. Tyson, Sculthorpe, Fakenham. W. Branton.

**BRAMMAS (Light).**—Cock.—1 and County, P. Haines, Pagrave, Dias. 2, J. P. Case, Testerton, Fakenham. 3, H. Watson, Cringleford, Norwich. Hen.—1 and County, P. Haines. 2, J. P. Case. 3, Rev. T. Wren.

**GAME (Brown or Black Reds).**—Cock.—1 and County, H. E. Martin, Sculthorpe, Fakenham. 2, S. Matthews, Stowmarket. 3, J. F. Walton, Hen.—1, H. L. Cockesedge, Woolput, Suffolk. 2, S. Matthews. County, H. E. Martin. 3, J. F. Walton.

**GAME (Any other variety).**—Cock.—1, H. L. Cockesedge. 2 and County, H. E. Martin. 3, J. F. Walton. Hen.—1, S. Matthews. 2 and County, H. E. Martin. 2, S. Matthews. 3, J. F. Walton.

**HAMBURGERS (Golden-pencilled).**—1, E. Walton, Horncliffe, Rawtenstall. 2, C. J. N. Row, Melford, County and C. H. T. Coldham, Lynn. 3, T. H. Readman, Hamburghs (Golden-spangled).—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**HAMBURGERS (Silver-spangled).**—1, E. Walton. 2 and County, H. R. Platin, jun. 3, C. E. Hills, Ely.

**POLANDS.**—1, G. W. Boothby, Louth. 2 and County, Major C. J. Ewen, Marlingford, Hants, Norwich.

**SPANISH.**—1, Furness & Sudall. 2, J. S. Dew, Gamlingay Mills, Cambridge. 3, J. E. Walton. 2, W. Cutlack, jun., Littleport. County, Major C. J. Ewen. 3, H. H. Willett, Norwich. 2, C. E. Hills, Ely. 3, T. H. Readman, Hamburghs.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**ANY OTHER VARIETY (Black).**—1, J. Ward, Bardon Hill, Ashby-de-la-Zouch. 2, J. H. Readman, Salford, Rawtenstall, Manchester. County, H. R. Platin, jun.

**POUTERS.**—Cock.—1, Mrs. Ladd, Calne. 2 and he, H. Pratt, Knowle. Hen.—1 and he, H. Pratt. 2, Mrs. Ladd.

**TRUMPETERS.**—1, H. Yardley, Birmingham. 2, C. Norman, Westerfield, Ipswich.

**FANTAILS.**—1 and 2, W. H. Tomlinson, Newark. he, J. F. Loversidge, Newark.

**TRUMPETERS (Ahoond).**—1, H. Yardley.

**TRUMPETERS (Any other variety).**—1, H. Yardley. 2 and he, G. South, New Bond Street, London.

**OWLS.**—Cock.—1, H. Yardley.

**BARRIS.**—Cock.—1, H. Yardley. 2, W. Massey.

**DRAGONS (Blue).**—1, G. South. 2, W. Smith, Walton, Liverpool. he, G. South. H. Yardley. 3, W. Smith.

**DRAGONS (Any other colour).**—1 and 2, G. South. he, Rev. H. H. Bridgewater, Snettisham.

**JACOBINS.**—1, G. South. 2, J. Thompson. he, G. South; F. Aldiss, Fakenham.

**TERBITS.**—1, H. Yardley.
